The Palgrave International Handbook of Human Trafficking
The Palgrave International Handbook of Human Trafficking

With 50 Figures and 42 Tables
The UN has noted that “slavery has evolved and manifested itself in different ways throughout history,” with more contemporary forms compounding “long-standing discrimination against the most vulnerable groups in society” (UN 2018). Statistics reveal that trafficking for a variety of exploitative practices exists everywhere, is growing year on year, and is one of the top three criminal trades in the world alongside arms and drug smuggling (UNODC 2014, 2016). According to the United Nations Office on Drugs and Crime (UNODC), at least 152 different nationalities were trafficked and detected in 124 different countries, with domestic trafficking accounting for 27% of all detected cases of trafficking in persons worldwide (UNODC 2014). The International Labour Organization (ILO) has estimated that, in 2016, there were 40.3 million victims of modern slavery worldwide (ILO 2017). Of this total, 24.9 million people were thought to be engaged in forced labor, with 15.4 million people living in forced marriages (ILO 2017). Of those subject to forced labor, an estimated 16 million victims were exploited by private actors, namely in the sectors of domestic work (24%), construction (18%), manufacturing (15%), and commercial agriculture (12%). According to the ILO, threats and acts of physical violence were experienced by a third of forced labor victims, with just under a quarter having had their wages withheld. Notably, women and girls accounted for 58% of total forced labor victims. Trafficking for sexual exploitation and forced labor are the most detected forms of trafficking. Collectively, women and girls represent around 79% of all victims of trafficking (UNODC 2016). The OECD Trafficking in Persons Report estimates a substantial majority of detected trafficked persons across the globe are females – mainly women, but increasingly girls. The vast majority of detected victims of trafficking for sexual exploitation are females. At the same time, the majority of detected victims for forced labor globally appear to be men. That suggests the reason or purpose for trafficking is connected to the gender of the person trafficked. Any response has to be cognizant of this dynamic but is not at present. The demand for different forms of human trafficking fuels its trade. The demand for females to service the sexualized commercial trade increases the number of women and girls trafficked for sexual exploitation (for instance, non-state torture, pornography, prostitution, forced marriage). The demand for exploitative labor in, for example, the construction industry, domestic service, and the like exposes loopholes traffickers use in order to abuse vulnerable individuals. The types of
exploitation traffickers employ have mushroomed as has the definition of modern slavery and human trafficking. For some, these definitions are too broad now; for others, it is essential that the law keep pace with reality.

So far, the story of human trafficking and modern slavery, we suggest, therefore, is one of failure and some success: a mixed bag, failure and some success of laws, policies, and implementation; failure and some success of joined-up approaches, community engagement, and services; failure and some success of genuinely listening to and acting in the best interests of victims/survivors. The growing number of persons being trafficked and the enormous profits for traffickers both attest to this.

The first concerns laws. It is a success story that there are myriad laws in place covering slavery, modern slavery, and human trafficking at international, regional, and domestic levels. These have changed over many centuries and are country-specific. While the definitions have changed, there are significant shortcomings. These are examined in some of the chapters in this book. Ranging from eighteenth-century slavery to twenty-first-century definitions, one has to question if the definition is working to end trafficking? Indeed, if we look at the rates of prosecutions and convictions across the globe, it is a failure – a paltry number by any standard. Governments refuse to take this issue seriously or collude in some measure leading to a lack of a culture of accountability. Laws are never enough; they are the start.

Implementation is key. Here too, there is a failure to adequately and fully implement the international and/or regional laws that detail how it should be implemented in practice. For instance, there is useful guidance available concerning the Council of Europe Action on Trafficking in Human Beings Convention 2005. The European Court of Human Rights of the Council of Europe has equally provided far-reaching guiding case law for some forms of trafficking, what a comprehensive investigation looks like, as well as how to identify and treat victims of trafficking with dignity. Most people suggest the implementation gap is where the real failing of laws, policies, and action plans lies. We would agree. Partnership working is a critical component in ending trafficking in human beings. The United Nations has been calling for partnerships between NGOs, the police, and governments for several years. There are tool kits and model action plans. There is still a reluctance to work in partnership with non-state actors, even though we know it is the site where most victims present. The implementation gap and a lack of adequate financial resourcing must end.

Institutional failings, therefore, make up a large part of why trafficking in human beings is seemingly flourishing. There are multiple institutional mechanisms in existence designed to help end trafficking, for instance, UN, regional, and national anti-trafficking coordinators and anti-trafficking tsars, to name a few. Institutional mechanisms vary in their effectiveness and independence. Institutions have the power to effect positive transformative change. Some are critically examined in this handbook.

The final failure and some success are the treatment of victims/survivors. There has been a significant increase in victims of trafficking being identified and, in some parts of the world, there have been significant improvements in how they are treated. However, often it is the victims/survivors who are asked (forced) to demonstrate
incredible resilience: from the relentless violence perpetrated by the traffickers and abusers, to finding a way through the criminal justice system, and finally entering the maze of the asylum process. At every stage, like functioning alcoholics, victims are being asked to be functioning survivors, never allowed to take a moment to rest, think, and start to recover, until the legal processes are finally complete. In some instances, the end is death. Victims/survivors want to be recognized as human beings who live in a community: they want their dignity restored and to live in peace in order to commence the rebuilding of their lives and that of their families. Admittedly, the law and services, to date, have failed mainly victims/survivors. That must end. Some chapters in the handbook examine the treatment of victims.

Trafficking in human beings is a twenty-first-century issue and challenge. It has explicitly been embedded in the UN's ongoing 2013 Agenda for Sustainable Development (SDGs) SDGs on human trafficking in goals 5.2, 8.7, and 16.2, and indicator 16.2.2. Each one addresses different aspects of modern slavery and intersects with the causes of trafficking. This crime is not going to go away by itself. So, it is the view of the editors that the causes must be addressed, including, but certainly not limited to, vulnerability, poverty, child abuse, so-called natural disasters and climate change, and gender and race inequality.

The book strives to steer toward some answers to these enormous questions. One thing is clear: we must act – more effectively, together, now.

Outline of the Handbook

This book is an international, comprehensive reference tool in the field of trafficking in people and slavery. It is a high level, systematic, and comprehensive book due to its breadth of entries from leading experts to international organizations and NGOs on the ground, covering everything from historical perspectives to cutting-edge topics. This handbook is genuinely international, spanning the entire globe, with contributions from actively engaged scholars and practitioners on virtually every continent (including Europe, North America, Australia, Africa, Asia, and South America). This book also covers problematic areas that cannot be found in other reference works, including family-based torture, victim/perpetrator identification, the role of women’s NGOs, parliamentarians, and a new UN Treaty. Not only does the project now represent the most comprehensive single collection on the topic but it is also a clear reflection of collective support and input to ensure that this will (hopefully) be the primary resource for academics, students, NGOs, and decision-makers who are conducting an inquiry into human trafficking. The Palgrave International Handbook of Human Trafficking is divided into eight key sections: (1) Legacies of Slavery and Human Trafficking, (2) Explanations and Methods of Inquiry, (3) Types of Trafficking in Human Beings, (4) Human Trafficking and Response Mechanisms, (5) Local/National/International Response Mechanisms, (6) Organizational Profiles, (7) The work of Nongovernmental Organizations, (8) Future Issues and Directions in Controlling Human Trafficking. Each section contains between 8 and 20 chapters, with an extraordinary number of chapters detailing response...
mechanisms and types of trafficking in persons. It is indeed an astounding range: organ trafficking, criminal activity trafficking, supply chain, sexual exploitation, and adoption, to name a few. Eminent scholars and practitioners have written the chapters in their respective field. Collectively, they are experts in their aspects of human trafficking daily and who have vast amounts of experience. These chapters are groundbreaking.

A unique feature of this book is its living nature. It is both at the forefront of research and of practice: it is online and can be and will be updated as and when the authors so decide and when there are new developments in the area. It, therefore, provides (as far as we are aware) the only up-to-date, comprehensive resource in the field.

October 2019

Acknowledgments

I, **John**, would like to acknowledge and thank my co-editor Professor Jackie Jones. Although this is our second edited collaboration – after two successful workshops on human trafficking held at the Oñati Socio-Legal Studies Institute in Spain – the scope and volume of this project was such that without her support and “extra lifting,” this project might not have come to fruition. It has been a genuine pleasure and honor to work with her again, especially on this important collection. I am also indebted to the contributors who have contributed to this collection and would like to extend a special thanks to our Section Editors. Unlike any other edited works I have undertaken, this project truly exemplifies the importance of teamwork in which all parties eagerly worked toward ensuring timely completion of the project.

I would also like to extend my heartfelt thanks to Ms. Josie Taylor (Commissioning Editor – Criminology and Socio-Legal Studies) for inviting me to undertake this project during a meeting we had a couple of years ago at an annual ACJS conference. Along with her colleagues Ruth Lefevre and Eleanor Gaffney and several other “behind-the-scenes” Palgrave staff, they collectively helped not only to keep us on track but provided, beyond the call-of-duty, support to many of the contributors who had questions about various technical issues that I felt less competent in answering. It has been a sincere pleasure to work with the Palgrave team and one that I would welcome doing again.

I would be remiss if I did not acknowledge my companion in life, Rose, who, while at times rightfully questions my sanity, long working hours, and numerous trips abroad doing human trafficking-related work, is always there to lend her support and encouragement. While no one has the right to expect such tolerance and patience, I am eternally grateful and indebted to her for all she has done and all who she is! And while our grandson is still too young to appreciate or understand the relevance of this work, I hope that any positive result and inspiration that might come from those who use the handbook will help to ensure that our collective efforts to expose and eradicate this blight on humanity will make his and his generation’s life safer and happier.

I, **Jackie Jones**, would like to thank John for providing me the opportunity to co-edit this fantastic project and being a brilliantly supportive (patient) colleague. John has been incredibly successful in bringing people on board and keeping contributors and the publishers on side. Thank you.
I would also like to thank Ruth and all the staff at Palgrave for an excellent working environment and all the toil to make this project come to life. You have made this project fun to work on despite its daunting size! Thank you.

I want to note my amazement at the resilience and my total respect for all victims/survivors of all forms of trafficking. Thank you for having the courage to speak up and speak out. You deserve so much better, and I am sorry I cannot do more.

Finally, I thank my son, Callum, my biggest teacher in life. Thank you for all your support and the many philosophical discussions. Let us hope your generation can do and will do better than mine.

Editors Biography

**John Winterdyk** is Professor of Criminology at Mount Royal University, Calgary. He has been engaged in research and writing on the subject of human trafficking since approximately 2004. In addition to being lead co-editor (with B. Perrin and P. Reichel) of the book *Human Trafficking: Exploring the International Nature, Concerns, and Complexities* (CRC Press, 2012), he also co-edited a special issue on human trafficking for the *European Criminology Journal* (2010), which was, as of 2015, the most widely accessed issue in the history of the journal. John has also co-authored several related journal articles. In 2019, he served as a guest editor for special issues on human trafficking for the Canadian “Justice Report.” Currently, he serves as the book review editor for the *Journal of Human Trafficking* and was a Director of ACT (Action Coalition on Human Trafficking). In April 2016, John co-facilitated (with Professor Jackie Jones – Bristol University) an international workshop on child trafficking at the Oñati International Institute for the Sociology of Law in Spain and produced a number of entries for different publications. Along with Jackie Jones, he also edited *Human Trafficking: Opportunities and Challenges in the 21st Century* (Lambert Academic Publishing, 2018). John has also presented on the topic at numerous international conferences over the past 12 years and in 2018 conducted a week long workshop on human trafficking in India after being awarded a GIAN grant.
Jackie Jones is a Member of the European Parliament for Wales (MEP) and former Professor of Feminist Legal Studies at the University of the West of England, Bristol. Until her election in May 2019, she had been researching and writing about human rights and equalities, especially women’s rights, since the late 1990s. Latterly, she focused on ending violence against women and girls. She has written several pieces about human trafficking and helped progress laws and policies in Wales on human trafficking. She was an activist until her election, attending/presenting at the United Nations Commission on the Status of Women each year, bringing students to present and gain experience as well as to meet international NGO delegates working in the sector. She was President of European Women Lawyers Association and visiting scholar at universities in Germany and France. She has given evidence in Westminster and Wales to government and has often been invited as expert to UK government, European Commission, and European Institute for Gender Equality meetings regarding equality and ending violence against women and girls. As MEP she sits on the Women’s Rights and Equality and Legal Affairs Committees of the European Parliament.

Part I

Legacies of Slavery and Human Trafficking
Understanding of twenty-first-century slavery and strategies for its prevention and eradication is still often shaped by cursory and Eurocentric conceptualizations of transatlantic slavery and its abolition. This Eurocentric historical understanding tends to be limited in its scope and so typically underplays the centrality of slavery to economic development, downplays the role of the enslaved in resisting their enslavement and securing abolition, and overemphasizes the role of white abolitionists (be they members of the Clapham Saints in Britain or white soldiers of the Union in the USA). The impact of this narrative has been twofold. Firstly, it has helped perpetuate the racial inequalities of transatlantic slavery to the present day by undermining the significance of transatlantic slavery in creating Western prosperity and the racial inequality within and between nations. Secondly, it has helped to shape an understanding of slavery as detached from wider economic, political, and social attitudes which create inequalities and the space in which slavery exists. Furthermore, the celebration of abolition and abolitionists encourages a belief that the problems of modern-day slavery can be addressed through legislation and increased policing that targets human traffickers. Instead, to tackle both the legacies of historical slavery and the forces...
that create the space for modern-day forms of slavery, it is necessary to address the economic, political, and social inequalities that (at local and global levels) create the conditions and structures which enable modern-day forms of slavery to emerge.

Introduction

This chapter’s purpose is to identify lessons that can be learnt from the history of slavery to help in the fight against contemporary injustice and slavery. In doing so, the chapter rests on a central premise that traditional historiographical narratives of slavery and abolition are flawed, having typically celebrated European abolitionists and silenced the role of enslaved people’s resistance to their enslavement and the central role of their labor in Western economic development. This Eurocentric narrative served to legitimize European colonialism in the nineteenth and twentieth centuries. The consequence of this interpretation of the past has been to detach the countries and societies that existed post-slavery from those that existed during slavery, with slavery considered an alien institution totally at odds with the values, principles, and practices of these nations. This attitude continues to this day. The West prides itself on values of democracy and human rights and sees slavery as anathema to these values and, therefore, itself. Consequently, ideas of reparations for continuing legacies of slavery are dismissed as slavery is not seen as something for which Western nations bear responsibility; after all, they abolished it, while others still practiced some forms of slavery. (Such positions were clearly illustrated at the 2001 UN Conference Against Racism and Xenophobia where European countries faced calls for reparations by Caribbean nations. See Beckles (2013). Beckles also details how Caribbean nations and reparations advocates perceive this history and its legacy. For a wider history of the reparations movement, see Howard-Hassmann (2008: 26–41).) Furthermore, this conceptualization of slavery as alien to Western values, combined with a celebration of historic abolitionism, defines an approach toward issues of modern-day slavery that exonerates the economic, social, and political practices of the West. Instead, a belief is fostered that slavery can be dealt with by legislative measures that focus on empowering policing operations against criminal enterprises that operate and/or profit from forms of modern-day slavery and human trafficking. However, when the history of slavery is more fully explored and the links between historical forms of slavery to wider economic and social policies are understood, it becomes clear that slavery is an institution that emerges and exists not because of criminal actors, but because slavery reflects relationships more widely replicated within society. Therefore, any efforts to address slavery must focus on addressing the wider economic, political, and social forces which create the conditions for slavery in the first place.

In looking to the history and legacies of transatlantic slavery to learn lessons for the fight against modern slavery, this chapter notes how arguments for reparations for transatlantic slavery and the fight against slavery today are often positioned as competing objectives (particularly by advocates of learning from historical
abolitionism). This chapter argues that such competition is false as it depends on a failure to understand the shortcoming of historical abolition and how the legacies of transatlantic slavery and the causes of modern-day slavery overlap. Both are the result of failures to deliver on the promises of human rights in the second half of the twentieth century. Both the legacies of transatlantic slavery and the conditions which enable modern-day slavery to exist can be addressed by promoting and guaranteeing human rights and equality for individuals so that life chances are no longer dependent on the lottery of birth, nationality, citizenship, and race. This is the lesson that this chapter argues needs to be taken from the history of slavery and abolition – that slavery reflects the wider structures, values, and relationships of society and these, therefore, need to be addressed if slavery is to be eradicated. Historical abolition did not address these wider forces; indeed, it reinforced them. Efforts to address slavery today which do not learn this lesson will similarly offer a form of abolition which is incomplete and unsatisfactory.

To advance this argument, the chapter first places transatlantic slavery within the historical context of slavery more generally and identifies how transatlantic slavery reflected, while diverging from, European patterns and rationalizations of inequality. This section also explores how abolitionism did not challenge but reinforced the religious and scientific theories which legitimated race-based slavery. The chapter then moves on to look more specifically at modern-day slavery. By linking back to transatlantic slavery and the shortcoming of abolitionism, the chapter links how reparations and the causes of modern-day slavery are both found in global and economic inequality and the failure to tackle these and to deliver the promise of human rights. The chapter concludes that policies to guarantee universal human rights can both address the legacies of transatlantic slavery and diminish the forces which create the space in which modern-day slavery operates.

**A Brief History of Transatlantic Slavery**

Slavery is a phenomenon that has been near constant throughout human history. Practiced by most societies, slavery has been central to economic and social relationships, underpinned by religious ideology and legal reasoning, and, typically, rationalized as either necessary, good, or inevitable (Walvin 2007: 5–34; Patterson 1983; Thomas 1997; Clarence-Smith 2006). Often slavery served as a punishment for criminal offences and an alternative to capital punishment. Equally, slavery could be an alternative fate to death on the battlefield and a means to incorporate the defeated into the triumphant society. At other times, slavery was the result of self-enslavement by those pushed to the brink of starvation by poor harvests resulting from drought or other climatic experiences – perpetual enslavement of one’s lineage in return for your and, therefore, your descendants’ survival (Davidson 2010: 246; Patterson 1983: 129–131). Transatlantic slavery was similarly the product of values and attitudes and practicalities at the time which made its emergence a rational economic development.
Transatlantic slavery emerged because practices in the African and European societies enabled a trade in enslaved persons to develop. The first European slave traders on the West coast of Africa joined a pre-existing coastal traffic in enslaved persons, purchasing enslaved people in Dahomey (which became known as the Slave Coast) and exchanging them in Ghana (which became known as the Gold Coast) (Thornton 1992: 111; Smallwood 2007: 10–20). For Europeans, entering a slave trade was not a new practice. Enslaved Africans had previously reached the European world via North Africa and the trans-Saharan slave trade (Northrup 2002: 6). Enslaved Africans had been featured in the slave markets of Italian city-states alongside Slavic peoples and, once the trade in Slavs decreased, had become increasingly important in providing the labor force for Mediterranean sugar production (Northrup 2002: 6; Walvin 2007: 5–34). As Europeans ventured down the West coast of Africa, their participation slave trading was, therefore, not surprising. As Europeans colonized islands of the west coast of Africa, the cultivation of sugar and the use of enslaved Africans in this process also migrated from the Mediterranean (Eltis and Richardson 2007: 6; Walvin 2007: 37–38; Thornton 1992: 16). Following the colonization of the Americas by Europeans, the Portuguese turned to the cultivation of sugar by enslaved Africans as a means to make their American colonies financially productive (Walvin 2007: 41). Other Europeans followed suit, and importation of enslaved Africans to provide labor in their colonies to produce agricultural products such as tobacco, rice, and sugar was established (Walvin 2007: 42). This decision was made easier by the Atlantic currents and winds helping to develop the triangular trade between Europe, Africa, and the Americas in the North Atlantic and a return trade between Africa and Brazil in the South Atlantic (Eltis and Richardson 2007: 8).

While the origins of the transatlantic slave trade reflected the prevalence of slavery in Africa and Europe and basic economic motives, the institutionalization of slavery in the Americas reflected the values, ideology, and practices of European societies. Christianity provided an early justification for the enslavement of Africans as, surely, it was better to be the slave of Christians than of heathens? (Blackburn 1997: 61). Both Christian and Muslim societies had long considered the enslavement of people from outside their faith to be acceptable (Walvin 2007: 22). Later, racial ideology deemed African people inferior and so came to legitimize their enslavement (Blackburn 1997: 61–65, 2011b: 88; Swaminathan 2009: 166). In both cases, the utility of religion and science in the intellectual rationalization and legitimization of inequality and exploitation reflected the role of religions and science in European societies. Seymour Drescher has detailed how the frontier nature of colonies enabled their societies to develop norms different and more extreme to those within Europe, but it is nonetheless the case that European ideologies and practices informed the development of colonial societies, including the institutionalization of slavery and the role of punishment as public spectacle and deterrent (Drescher 2012: 85–89). In the USA, Southern planters legitimized slavery as benign by rooting their conceptualization of themselves in the chivalry of English feudal lords who supposedly protected those weaker and lesser than themselves (women, children, and household servants) but who also had the right and the duty to recourse to
violence (Fox-Genovese and Genovese 2005: 337; Davis 2006: 198). This self-conceptualization and legitimization demonstrates how European society provided a bedrock from which settler colonial societies emerged, how appeals to religion were utilized to legitimize slavery as well as other forms of inequality and exploitation, and how chattel slavery both differed from and echoed wider societal relationships. Similarly, ideas of the innate inferiority of Africans due to their racial difference reflected arguments about the poor and working class to legitimize their exploitation within European countries, where first poverty and inequality were put down to God’s will and then later to ideas of degeneration and racial inferiority (Blaut 1993: 33; Pollard 2000: 104–111; Davis 1975: 467–468, 489; Linebaugh and Rediker 2013: 17). On both sides of the Atlantic, the economic development of early capitalism depended upon the exploitation of persons deemed exploitable by the elites for reasons such as race, religion, or poverty (Mintz 1985; Thornton 1992: 72–97). Often this unfairness was identified by those at the bottom. For example, accounts of poor whites and slaves mixing and rebelling or running away together are common (Linebaugh and Rediker 2013: 237–247). The support of Manchester’s working class for the cause of the Union against slavery during the US Civil War, as well as the extent of working class petitioning against the slave trade and slavery, also attests to how the industrial working class of Britain identified with the exploitation of enslaved Africans and saw their struggles as shared (Linebaugh and Rediker 2013: 237–247; Blackburn 2011a).

Shared interests between the white poor and enslaved Africans, however, were not always identified. During the period of slavery in the USA, the fear of slavery and the idea of slavery as being worse than poverty and subsistence wages acted to align the interests of the poor white men to the interests of the rich, slave-owning aristocratic class (Bell 1988: 767; Patterson 1983: 255–261). In this sense, slavery enabled the enfranchisement of all poor, landless, white men because fear of slavery reduced the likelihood of their becoming a socially revolutionary threat to the elite. In contrast, poor white men in European countries would have to wait a longer period for suffrage. However, European colonialism acted in a similar manner to slavery in the USA by uniting the interests of the poor with the elite. Poor white people in Europe could benefit emotionally and psychologically from the national and racial pride that came with being part of an important imperial power. Likewise, poor colonists could benefit from opportunities that were not afforded to colonized peoples (Huttenback 1976; Howard 1978: 15; Howard-Hassmann 2008: 98–99; Johnson 2006: 319–321). Theories of race that argued there were hierarchies within and between races and therefore legitimated and helped to entrench both racial and class hierarchies (Davis 2006: 153; Jordan 1968; Winfield 2007: 71). These ideologies were not ended with the abolition of slavery.

The persistence, indeed, the entrenchment of ideologies of racial hierarchy after the abolition of slavery across the Americas, illustrates how the abolition of slavery did not end the societal attitudes and values that had enabled slavery to flourish. An important factor in the entrenchment of pro-slavery and racist arguments was the economic decline of the British West Indian colonies following abolition (which was interpreted by defenders of slavery as a vindication of their arguments concerning
African laziness) (Drescher 1977: 20; Davis 2006: 189). The correlation between abolition and West Indian economic decline, however, also contributed to the developing narrative that abolition was a selfless gift to the enslaved. As Robin Blackburn describes, abolition became associated with progress and civilized behavior (Blackburn 2011b: 395–449). The British, who were first to abolish both their slave trade and institution of slavery, congratulated themselves on their national, racial, and religious superiority (Blackburn 2011b: 475; Quirk 2011: 54–110). The British pushed abolition of the slave trade as a moral crusade forcing and bribing other European and American nations into passing anti-slave trading legislation (Davis 2006: 270; Thomas 1997: 557–785; Kielstra 2000; Eltis 1987: 208–211). Ultimately, especially once the USA had abolished slavery through the Civil War, slavery became seen as backward and abolition modern and progressive (Davis 1966: 268–269). This changing view of abolition helped the European and American nations (which had instituted chattel slavery and grown rich from the profits) to congratulate themselves for providing the gift of freedom and enlightenment. Across the transatlantic world, the role of enslaved people in resisting enslavement and in fighting to gain their freedom was erased from popular memory. In Britain, abolition was represented as a gift from enlightened white men in parliament. Meanwhile the resistance of enslaved individuals and of working-class petitioners and women who identified the fight against slavery with their own struggle against starvation wages and for political voice was erased until recently. (Recent decades have seen work to recapture the role of women, the working class, and enslaved persons to the fight against abolitionism, and this has become increasingly publicized. However, the leadership of white men remains largely credited as the main reason for the success of abolition. See, for example, Davis (1975: 306, 2006: 205), Blackburn (2011b: 281), Midgley (1992: 1–6), Clapp and Jeffrey (2011), and Oldfield (1998: 14, 33–43).) In the USA, the sacrifice of white soldiers for the Union was used to develop a narrative of white sacrifice for the liberation of enslaved African Americans and to reaffirm the idea of American Exceptionalism and right to colonize the continent of America (Blight 2002: 122). For a nation where the ideal of American citizenship was founded in the Revolutionary War against British tyranny, the erasing of African American resistance to slavery, including in the Civil War as soldiers, spies, and saboteurs, helped to undermine (in white eyes) the eligibility of African Americans for freedom as they had not fought for it as all Americans should (Blight 2002: 120–152; Foner 1988; Tulloch 1999: 113). In consequence, this constructed memory of slavery and abolition not only helped the social hierarchies of slavery to persist past its abolition but masked these continuities and helped foster, among white people’s perspectives at least, a belief that abolition made amends for slavery.

Therefore, while abolishing the institution of slavery, abolition did not address the wider factors and forces within society that had created the space for slavery to flourish. Abolition was a reform which altered the legal framework of inequality, social hierarchy, and the acceptable limits of institutionalized exploitation and barbarity. Equality was provided to freed people, in the sense that they were now free to join the ranks of free, poor labor and to work for starvation wages. (Indeed,
economic arguments against slavery had often centered on slavery as being inefficient and costly due to the need to pay to feed, house, and clothe slaves when they were not economically contributing their labor due to them being a child, ill, injured, sick, or too old, whereas employers of free labor did not have to pay people unless they were working. See Davis (1975: 492). This situation characterized the lived experience of poor working-class white people across most of the Western world, who did not have voting rights and who were prevented from establishing and joining trade unions to negotiate collectively for better pay and conditions (Davis 2006: 23; Davidson 2010: 246–248; Thompson 2013). The ramifications of this move will be discussed throughout the remainder of this chapter. Of course, racial prejudice remained and continues to be a determining factor in economic opportunity and life outcomes to this day. What is more, Eurocentric historical narratives of slavery and abolition continue to significantly influence how the legacies of transatlantic slavery and modern-day slavery are understood and addressed.

The Reparations Debate

Before this chapter considers the issues of modern-day slavery, it is helpful to briefly consider the debate over reparations for transatlantic slavery. Reparations advocates argue that (often financial) redress should be paid to the descendants of enslaved persons to correct generations of unfair poverty due to the legacies of slavery and discrimination. The reparations debate first emerged in the USA during the 1960s (Biondi 2007). The debate before faded during the successes of the Civil Rights Movement and then re-emerged as frustration about the continued impoverishment and racial discrimination against African Americans, despite the successes of the Civil Rights Movement, took hold (Torpey 2006: 48–49; Bittker 2003; Robinson 2000). The re-emergence of calls for reparations was also influenced by the payment of reparations by Germany to Eastern European survivors of Nazi era crimes following the collapse of the Soviet Union (Brooks 2004: xv; Biondi 2007: 258–259; Howard-Hassmann and Gibney 2008: 7–8). Calls for reparations are not limited to the USA. Rather, the US reparations movements have caused many in African and Caribbean nations to look to deeper histories to explain the causes of contemporary injustice. Consequently, calls for reparations to African and Caribbean nations for the legacies of slavery have arisen (Gifford 2000; Howard-Hassmann 2004). This case was prominently debated at the 2001 United Nations World Conference Against Racism and Xenophobia where it was agreed that the slave trade and slavery had been crimes against humanity although they might not have been considered so at the time (Howard-Hassmann 2008: 37). Frustrated with the lack of achievement at this conference and with the low level of support from African nations, the Caribbean Community of Nations (CARICOM) has since developed a legal claim for reparations from European nations (Beckles 2013). As with calls for reparations in the USA, calls for reparations to African and Caribbean nations argue that the harms of slavery are still manifest in unequal distributions of wealth and in racial inequality. CARICOM’s Ten-Point Plan for reparations therefore
calls for financial compensation, apology, and funding for programs of education, commemoration, and the fostering of links between Caribbean and African nations (Leigh Day 2014).

The response to calls for reparations is still largely shaped by Eurocentric narratives of slavery and abolition. Opponents of reparations argue that the process of abolition already constituted compensation, either due to the amount of blood and money spent on abolition (as in the case of the US Civil War) or through the cost of suppressing other countries’ slave trades (as in the case of Britain). (Opposition to reparations in the USA is typified by David Horowitz’s (2002) Uncivil Wars: The Controversy over Reparations for Slavery. Some of Horowitz’s arguments concerning the sacrifice of Union soldiers are unpicked by Manfred Berg (2009: 83). For a discussion of the claim for reparations for African Caribbean nations and the position taken by Britain and other Western nations at the 2001 UN Conference Against Racism and Xenophobia in Durban, see Beckles (2013: 172–210). In Britain’s Black Debt, as Beckles develops and articulates the case for reparations to Caribbean nations, he often presents opposition to the arguments put forward by opponents to reparations. For an overview of the origins of the reparations movement for Africa and critique of the legal framing sometimes selective historical contextualizing of reparations claimants, as well as the opposition of countries such as the USA at the 2001 UN Durban conference, see Howard-Hassmann (2008).) In addition, opponents of reparations argue, firstly, that the gift of abolition did not have to be given and that those who have received the gift should be grateful and, secondly, that the African nations who claimed they were harmed by the slave trade should acknowledge that Africans and others (aside from the Europeans) practiced slavery and often did not abolish it until they were forced to do so by colonial interventions or Western pressure (Beckles 2013: 169–170). Any inequalities which exist today, opponents of reparations argue, are not the result of past wrongdoing or an uneven playing field where the hierarchies and prejudices of slavery still persist, but the result of the failings of black people and independent African nations to take advantage of the opportunities offered to them as free and equal players in national and global economics (Beckles 2013). In making these arguments, opponents of reparations clearly echo the Eurocentric historical narratives that presented abolition as an enlightened gift. In doing so, they underline the effect that these narratives have had in promoting abolition to distract from and downplay the significance of preceding centuries of slavery. The failure of abolition to challenge the economic, political, and social hierarchies that had existed in slavery and remained during colonialism is highlighted.

It is also the case that the way in which reparations advocates define their arguments shows that they too are influenced by how the history of slavery has been remembered. Frustrated with how historical narratives have been typically Eurocentric and frustrated with the harmful legacies of slavery (identified by reparations advocates as racially codified economic and social inequality), arguments for reparations are typically pan-African and at times as selective as the Eurocentric narratives they challenge. In seeking reparations for transatlantic slavery, reparations advocates must demonstrate the continuing financial harms caused by historical slavery to the descendants of enslaved people.
In doing so, the harm of slavery is necessarily represented as exceptional and isolated from wider historical injustices and inequalities that, as discussed in the first half of this chapter, created the space for transatlantic slavery to flourish in the first place and which have perpetuated the inequalities of slavery to this day. Furthermore, by rooting the case for present-day rights in the rectifying of historical wrongdoing, reparations are regressive as they do not base the case for equality and justice for individuals’ suffering from the legacies of slavery within their rights but within the violation of their ancestors’ rights (Torpey 2006; Evans and Wilkins 2018). The repair offered by reparations, while arguably justified and potentially beneficial, does not offer a repair that is thorough enough to fully overcome the legacies of transatlantic slavery as it fails to address the wider forces and harms central to this history but not specific only to transatlantic slavery and racial inequality.

Modern-Day Slavery and Abolitionism

Historical understanding of slavery does not just impact upon how legacies of transatlantic slavery are understood. The fight against modern-day slavery is similarly hampered by how historical slavery and its abolition have been remembered and the lessons that individuals and organizations therefore seek to take from this history. The role of abolitionists in banning slavery by passing legislation is still celebrated by those who seek to look to the past for action against modern forms of slavery (Quirk and LeBaron 2015: 8–15; Davidson 2015: 1–12; Kempadoo 2015: 8–20; Bales 2000: 29–31, 263–264; Rickert 2009: 46). In looking to the past, such arguments take advice from a Eurocentric reading of history and the role of abolitionist heroes, rather than the failure of historical abolition to deliver full abolition by dealing with the wider structures which enabled slavery to occur (Bravo 2011). Such leanings were particularly apparent in how politicians sought to utilize the 2007 Bicentenary of the Abolition of the British Slave Trade Act as a means to promote national pride and how 2007 contributed to a growth in campaigning against modern-day slavery and human trafficking. The impact of such historically informed campaigning can also be seen in the passing of the UK’s 2015 Modern Slavery Act and following campaigning pressure from the Anti-Trafficking Monitoring Group and the shortcomings of this act (Beddoe and Brotherton 2016: 10).

The 2007 Bicentenary served to introduce into UK popular consciousness the idea of reparations for the legacies of transatlantic slavery and to raise the issue of contemporary forms of slavery. It is not surprising that these two issues arose together. On one hand, the Bicentenary offered an opportunity to challenge how past Eurocentric historiography had celebrated only white abolitionist leaders and to consider how the history of slavery had shaped the modern world; and many within the museum sector and African and African Caribbean communities of Britain were keen to promote African perspectives and challenge past Eurocentric narratives (Museum in Docklands 2008; Fouseki 2010; Wilson 2010; Dresser 2009; Prior 2007; Hamilton 2010). On the other hand, the Bicentenary encouraged an interpretation of this history that reinforced a focus on abolition and thus notions of moral leadership and British superiority (Goggins 2006; Brown 2007; Wood 2010a;
The British government was often keen to promote this narrative to counter the negative reputational fallout of the Iraq War (Wood 2010b). These two themes coalesced in arguments which fought to utilize the inspiration of abolitionist heroes of the past for a campaign against modern-day slavery. While seemingly positive (who could argue against combating modern-day slavery?), this process also had two negative impacts. Firstly, these arguments distracted from and downplayed the legacies of transatlantic slavery and the case for reparations by positioning the ideas of addressing modern-day slavery and the legacies of historical slavery as somehow competing interests. Rarely explicitly stated, when the history of transatlantic slavery was discussed, a segue would be made to say that: “whilst that history was bad, isn’t it awful that slavery still exists nowadays?” (Brown 2007). This served to shift public and political attention from transatlantic slavery and its legacies and downplayed the problems identified by reparations advocates by insisting that focus must be on addressing the harms suffered by those enslaved today (Quirk 2015: 85–89). Secondly, such arguments encouraged a conceptualization of modern-day forms of slavery as wholly alien to Western economic practices and values. Therefore, modern-day slavery could be eradicated by instigating policing actions and legislation that curtailed specific opportunities and practices of malefactors. By framing modern-day slavery as a crime and not a social, economic, and political failing, modern-day abolitionists argue that individuals today can help abolish modern-day forms of slavery by being vigilant for potential victims of human trafficking and by calling upon governments to act (Rickert 2009). In this argument, wealthy Western individuals today can be abolitionist heroes like Wilberforce and Lincoln (Davidson 2015: 10). However, while laudable, individual actions cannot compete against a global, systemic valuation of economic profit over human welfare. Moreover, the process of prioritizing contemporary slavery over the legacies of historical slavery is a mistake as both issues stem from the same problem and can be addressed through similar steps.

Contemporary forms of slavery, like historical slavery, reflect wider economic, political, and social policies and ideologies. Similarly, the legacies of transatlantic slavery identified by advocates of reparations (racial inequality at local and global levels) also reflect these same forces. In this sense, legacies of transatlantic slavery identified for repair by reparations advocates are typically not direct legacies of transatlantic slavery, but harms that have been perpetuated and constantly recreated by the continuation of economic, political, and social policies at national and international levels that protect and maintain inequalities. (Reparations claims highlight how more recent policies have impacted upon current inequalities by perpetuating historical injustices. Regarding reparations to African and Caribbean nations, they highlight the role of colonialism and global economics; see Leigh Day (2014), Beckles (2013), Howard-Hassmann (2008), and Quirk (2015: 86). Advocates of reparations for African Americans also highlight the role of Jim Crow, segregation, and discrimination up to the present day. See, for example, Bittker (2003), Robinson (2000), and Brophy (2006: 100).) These same policies help to create the conditions for contemporary forms of slavery as inequality at national and international levels persist. This is both the case with traditional forms of slavery in nations such as
Mauritania and India where slavery and debt bondage reflect traditional racial and caste hierarchies and are legitimized by traditional ideologies and religions and with modern forms of human trafficking (Bales 2000). Both rely on economic inequality to create a vulnerable and exploitable group of people. Both rely on weak protection from state forces and complicity from the public.

While modern-day forms of slavery are roundly condemned by politicians and public alike, modern-day slavery exists because of economic inequality at global and local levels and because of policies which deny certain individuals state protection leaving them vulnerable to exploitation. Slave labor in Thai fishing boats, in West-African cocoa farms and precious metals mines, on Middle Eastern construction sites and domestic service, and in Western nations in food cultivation, sex work, and drug cultivation, manufacture, and distribution are all facilitated by wider economic inequality and controls on migration (Bales 2007: 213–228). While politicians may talk about the need to combat modern-day slavery and enact legislation to tackle specific instances of human trafficking or labor exploitation, their wider political agenda and the policies they enact frequently exacerbate the problem. For example, prioritizing controls on migration, criminalizing those in violation of migration laws, and promoting deregularization of the free market and deregulated labor markets all further endanger those vulnerable to exploitation (Davidson and Howard 2015; Sharma 2015: 36–40; Davidson 2010: 246–248; Anderson 2010; Anderson et al. 2011). These policies, plus popular demand for cheap consumer goods (and illicit drugs and sex), combine to create the conditions in which slavery exists. While the UK government has proclaimed itself a leading nation in the fight against modern-day slavery with its 2015 UK Modern Slavery Act, its action has been perfunctory and largely for show (Beddoe and Brotherton 2016; Roberts 2015: 14–19). While talking the good talk, the UK government’s refusal to accept unaccompanied child migrants from refugee camps in Calais (an act that left children vulnerable to human trafficking and sexual exploitation) is more characteristic of its actions (Travis and Taylor 2017). In addition, those who are identified as victims of human trafficking in the UK are often criminalized for violations of migration laws or other laws they had been forced to violate (even though this is against the government’s own guidance) (Kelly and McVeigh 2018; Beddoe and Brotherton 2016). Similarly, European nations more widely seek to enact policies against modern slavery while simultaneously refusing to accept migrants for spurious reasons and returning many thousands to countries where they are vulnerable to forced labor and placed at the mercy of human traffickers if they wish to try and reach Europe again (Sunderland and Frellick 2015: 41–45). Economic national interests shape international policies on issues such as tax and migration – which contribute to global economic inequalities – making people desperate to travel to wealthier nations in search of employment and a better future (LeBaron and Howard 2015: 89–92; Traxler and Woitech 2000; Christian Aid 2014; Anderson 2010; Niño-Zarazúa et al. 2017). The deregulation of Western labor markets through the neutering of trade unions and organized labor over recent decades has corresponded with increasing inequality that has widened the spaces in which exploitation that includes modern-day slavery can exist and grow (Wilkinson and Pickett 2010: 13).
In short, there is a vicious economic circle in operation. Without addressing these wider factors, the form of abolition offered today, like its historical predecessor, tackles only the most extreme cases of exploitation while legitimizing the system that creates this exploitation by entrenching inequality (Bravo 2011: 582).

**Conclusion**

This analysis of how to address the legacies of transatlantic slavery and the causes of modern-day slavery runs counter to the popular historical understanding of the history of slavery and abolition and to popular national identities as outlined above. It calls for reforms to the entire structure and hierarchy of the current, dominant global model of economic organization. As such, it is an analysis that threatens the current position of global elites as it calls for reforms which in their scope and extent (if not their methods) are arguably revolutionary. This is because this analysis identifies wealthy nations and individuals not only as beneficiaries of a historical institution of slavery but also of slavery today. While Western nations and the global elite claim to be opposed to slavery, they perpetuate a global system in which slavery is a logical and inevitable outcome. Rather than being a deviation from the values and structures that they have put in place, slavery replicates the model of these very structures and exists only because these structures create the space and means for modern-day slavers to operate and the vulnerable crop of people to enslave. While curation of historical understanding has used the abolition of transatlantic slavery to legitimize the current global economic model and leadership of wealthy Western nations and the global elite, a deeper historical analysis as briefly outlined in this chapter reveals the superficial and self-serving nature of such analysis. Going further, the failures of past abolition reveal that confronting slavery in isolation from wider social, economic, and political reform and transformation is largely a symbolic and self-serving gesture. Modern-day abolition, if it takes historical abolition as an example to follow, offers a similarly compromised gift. Instead, the full repair of legacies of transatlantic slavery and a true approach to the prevention of modern-day forms of slavery both depend upon ending the social and economic hierarchies and principles upon which the modern world operates. For example, local and global wealth redistribution; the provision of housing, education, and employment; and the right to freedom of movement will all serve to close down the spaces in which exploitation proliferates. In short, to repair the legacies of slavery and to prevent new cases of slavery, human rights must be prioritized.

Introduction

In the wake of the conquest of Jamaica in 1670, the English, and then British, developed the third largest island in the Caribbean into an economically vital sugar-producing powerhouse. Scholars have spent decades studying how the colonization of Jamaica transformed the Caribbean and the Atlantic world, including foundational work by Dunn (1972) and more recent studies such as Pestana’s (2017) exploration of the conquest itself. Central to any story of Jamaican history are the enslavement, violent trafficking, fatal punishments, torture, and overworking of African slaves. Plantation owners in the West Indies established slave agriculture as the cornerstone of economic growth within the British Empire, and this system of labor provided the foundation of a transatlantic trade network so influential that, according to Eric Williams (1994, p. 52), it created a “triple stimulus to British industry” and helped spur on the Industrial Revolution a century later. But slavery was not an institution built on stable ground, and the violent and oppressive regimes of white overlords were answered in kind by armed resistance from the enslaved. During over two centuries of British rule in Jamaica, a series of violent clashes between the enslavers and the enslaved erupted, and each played a substantial role in shaping the history of

the island. They also had a role in the broader history of the British Empire. This chapter seeks to understand how two of those moments of resistance, the 1760 uprising by African slaves known as Tacky’s Rebellion and the 1832 upheaval of Afro-Jamaicans known as the Christmas Rebellion or the Baptist War, played a role in shaping how observers thousands of miles away understood slavery, race, and empire.

While the American Revolution represents the most famous act of resistance to British imperial authority, it was far from the only. We cannot understand the British Empire, or the systems of power, authority, and control that it used to expand across the globe, without understanding these moments of rebellion. During these periods of upheaval, newspapers represented the most direct and widely available means by which British subjects could learn about and interpret challenges to British rule. Among the most important threats to the order of the empire were those posed by the people held in perpetual bondage in the Atlantic world. The first great slave rebellion in the British Caribbean came with the 1760 conflict known as Tacky’s Rebellion, or Tacky’s War, named for the man who led the insurrection. Part 1 will explore how newspapers helped shape discourse surrounding this conflict and examine how interpretations of Tacky, and his rivals in Jamaica, played out in eighteenth-century British papers and the role that these newspapers had in forcing British eyes onto imperial problems. Part 2 will highlight the continuation of discourses on empire, slavery, and rebellion in the wake of the 1832 Baptist War, so named for the role that Baptist missionaries allegedly played in inspiring the uprising.

**Historical Background**

As Britain, not Jamaica, is the focus of this work, it is important to frame this study within British history. Although eighteenth-century Britain’s democratic structures were notoriously corrupt and would remain in that state until at least (and likely well after) the Reform Act of 1832, Britain did have a vibrant public sphere and myriad forms of popular political expression. Scholars, including MacKenzie (2004), Brown (1985), Jones (1996), Wilson (1998), and Greene (2013), among many others have explored in detail the role of the British newspaper in both British culture and in the imperial project throughout the eighteenth and nineteenth centuries. While each paper would have had its own political angles and motivation, what matters for this study is the broader trends. A more detailed survey could explore the details of the discourse, but for the sake of this project, we can find something of significance in the larger narratives. Tracking public opinion, in a modern sense, can be difficult in the eighteenth century, and so rather than proving that public opinion shifted in the aftermath of rebellion, this study will show that rebellion forced discursive engagement with slavery in the metropole, even far from the places in Britain where slavery and its economic benefits to the empire were more visible.

In 1760 the empire was largely still made up of Anglophone Protestants mostly in the British Isles and the Americas, the Irish Catholics, and the many enslaved Africans who toiled in the fields and cities of colonies from New England to
Barbados. By 1832 the scale and makeup of the empire had changed dramatically. While the United States was lost, colonies in Canada, Africa, Australia, and most famously India allowed the reach of British imperial power to stride the globe. However, even as the empire grew, slave owner influence in Parliament reached its nadir. In the last decades of the eighteenth century, the British faced a sustained debate over the place of slavery in the Empire. This culminated in court cases that brought about the legal end of slavery within England (1772) and Scotland (1774) and hotly contested parliamentary debates that brought about the official end of the British slave trade (1807). The enslaved in Jamaica knew the tides were turning against their masters and set out to secure their freedom by what Michael Craton (1982) has described as a sort of large-scale unfree work action. Faced with a slave owning master class intent on withholding freedom, the Jamaicans of 1832 took to the streets to secure their liberty and faced brutal repression in response.

Through the detailed exploration of the two conflicts, we can understand the way that interpretations of resistance to bondage played a fundamentally important role in shaping discourses about empire, race, loyalty, and subjecthood. What follows is only a sample of the larger discourse that focuses on a series of stories that start this exploration. The stories quoted here reappear across a range of newspapers in Britain, and so the papers may not represent the largest cities in Britain nor those ports most directly benefited by the slave trade. However similar, or in some cases verbatim copies, of these stories ended up in other papers across the British Isles. This range of cities also represents a distance across the British Isles engaged in the discourse of imperial debate. As such this study tries to find the most complete and earliest printings of each narrative. It is by no means exhaustive but illustrates that a further analysis of the wide reach of these stories could be a fruitful study of yet another influence of slavery and resistance on the history of the British Empire and the Atlantic world.

**Part 1: Tacky’s Rebellion**

Scholars in the fields of slavery and rebellion, including Richard Burton (1997) and Vincent Brown (2008), have focused on the importance of the African origin of the instigators of Tacky’s Rebellion, both from the perspective of contemporary white Jamaicans and from that of the African rebels themselves. Both Michael Mullin (1995) and Marvis Campbell (1988) cited more systematic and material influences on what inspired and drove the 1760 uprising, including the role of the Maroons and resource scarcities. But to the question of scale, few have gone as far as Trevor Burnard (2004, p. 10), who described Tacky’s Rebellion as the most significant revolt in the Americas prior to the American Revolution “in terms of its shock to the imperial system.” It certainly had a far-reaching impact on Jamaica itself. As described by both Burnard (2004) and Newman (2011), in the years following the 1760 uprising, the Jamaican Assembly passed a series of harsh laws designed to reinforce white control over slaves and prevent future insurrections. The laws failed to have the desired effect of suppressing future uprisings, and the enslaved
The population of Jamaica would rise up repeatedly throughout the 1760s. The violence of the second half of the eighteenth century in Jamaica kicked off with Tacky.

Tacky’s Rebellion began on Easter Sunday of 1760 and would continue until October 1761, though violent uprisings would occur throughout the 1760s after the suppression of the first rebellion. The revolt broke out in a culture of growing apprehension among the white planters due to the ongoing Seven Years War and the rising population of slaves, many of whom had come from the same region of Africa, and whose status as recent immigrants made them, in the eyes of slave owners, more dangerous and more prone to acts of resistance. According to Reynolds (1972), an over-reliance upon the free Maroon communities, with whom the British signed a treaty in which the Maroons agreed to help suppress future runaways in return for quasi-independence, and the general laxity of security brought about by the Easter holiday gave slaves the perfect opportunity to unite and mobilize into what Craton (1982, p. 127) referred to as “marronage on an unprecedented scale.”

As British newspapers began to report on the insurrection, the rebellion, or as it was called in the Derby Mercury of June 20, 1760, “some Disturbances among the Negroes,” quickly expanded into three separate insurrections by June 27. Over the course of June, July, and August, the size and scale of the revolt varied from report to report. The swirly numbers and range of the rebellion was indicative of the larger confusion that accompanied news from the colonies. Nothing from the Caribbean was ever certain beyond a doubt, and so meaning was forged through the reprinting and consumption of the stories themselves. In the case of Tacky’s Rebellion, the focus of meaning fell on violence. Both the rebellious slaves and their white masters committed acts of violence, and both allegedly engaged in seemingly barbarous cruelties. The Derby Mercury of August 1, 1760, reported gruesome and scintillating details about the rising tide of violence, highlighting the rebels’ plan to turn skulls into drinking vessels and the scheme by whites to collect ears as tokens of their kills.

The British press used the language of savagery, violence, and cruelty to describe both sides of the struggle, not just the rebellious African slaves. The shared burden of this violence is indicative of what Jack Greene (2013, p. 156) has described as the “deviant and distinctive” creole character. To British observers, this rebellion was a specifically creole affair, both in terms of its brutality and the makeup of those who fought on the side of government. The Caledonian Mercury reported that a militia leader named Mr. Bayley “had with great celerity collected near 130 whites and blacks,” and later, on April 10, “the rebels were attacked by a party of Crawford town Negroes.” Another hero of the rebellion identified by the Leeds Intelligencer of July 1, 1760, was a Mr. William Trowers who led 12 black loyalists against a large rebel force and “boldly engaged” with the enemy. In these stories we see a collection of multiracial Jamaican militiamen against an enemy force of “Gold Cost” or “Coromantee” Africans. As a result, loyalty, like violence, was not unique to either race, and foreigners were driving the uprising, not unruly domestic subjects.

Loyalty to the British Empire played a central role in the larger narratives of Jamaican history as well. The Caledonian Mercury of March 13, 1762, produced a history of Jamaica including the story of how English troops only drove out the last of the Spanish defenders, thanks to the aid of disloyal and mistreated slaves. The
Mercury provided a clear warning to the Jamaican planters and a warning to the British readers who may have thought the overlords to be just in their treatment of the slaves:

For as the negro slaves of that island, of which there are about one hundred thousand, their merciless masters know too well the cruelties they have practiced upon those miserable wretches, to expect any other return than betraying them to an enemy, or cutting their throats; and of this there hath been such recent experience, by an open rebellion of the negroes in various parts of Jamaica for many months, that only chance this nation hath of preserving it, if attacked, seems to be that of preventing the enemy from effecting a land.

While in normal circumstances, the ill treatment of slaves may have been an acceptable cost of their value as producers, in a time of war when the British nation was engaged with its historic enemies of Spain and France, the risk was far too high. Loyalty and stability were vital to Britain’s imperial interests.

As reported by the Caledonian Mercury on July 19, 1760, during the tensest moments of Tacky’s Rebellion, white Jamaicans expressed dread that, using an army of well-treated slaves trained to be soldier, French invaders would unite with rebellious Jamaican slaves and capture the island for France. In light of these growing threats to British control over Jamaica, there was only one proposed solution: amelioration. This was a call for the improved treatment of slaves and was shared by the press and in the halls of political power in London and with the Governor of Jamaica who transmitted this message to the Jamaican Council in December of 1760. The Governor called upon the overseers and owners to secure the island’s safety not just through civil commitment to justice but also to “keep their Negroes steady in the Affection” and prevent future uprisings through compassion rather than control.

The crown had a second reason to court the sympathies of the black population of Jamaica: so that the slaves and free blacks could be used to fight against the Spanish and French in the Americas. In February of 1762, the Governor announced the declaration of war against the Spanish to the Assembly of Jamaica and set about attempting to raise a force of 500 free blacks and 2000 slaves to be used in the coming conflict. The Leeds Intelligencer reported on the arming of blacks being proposed in the Jamaican Assembly as early as October 27, 1761. Although the Maroons and free blacks were already engaged with the rebels by this point in time, the Intelligencer put forward that the motion “had been strongly opposed and carried in the negative.”

Instead of arming the slaves as requested, the Jamaican Assembly focused on suppressing them further. In December of 1760, the Assembly passed two acts calling for the raising and arming of parties used to suppress the rebellion, and one passed to reward those slaves who had aided the colony by turning on their fellow slaves. On top of the fiscal response of raising more defenses and rewarding loyalty, the Assembly also redefined the social status of all non-Whites on the island. Specifically, the legislature sought to restrict assemblies of slaves, prevent the ownership of arms by slaves, and require the possession of travel tickets for slaves away from their plantations.
Regardless of the cause of the rebellion or the fault for its intensity, both Jamaican and English observers believed that corrective action and retribution was required. Punishment in Hanoverian England was, according to V.A.C. Gatrell (1994), a common and unremarkable event and, in the rare occasions when it was recorded in the newspapers, was often done under nonviolent euphemisms. But there were no euphemisms here in the language used by the press; executions were described regularly and in detail. The language used by newspapers concerned both the punished and the punishments. In July reports began of the executions, with the *Manchester Mercury* and the *Derby Mercury* of July 1760 both reporting that the ringleaders of the rebellion “were taken and executed.”

The most detailed stories of state violence often identified the slaves by name, providing a humanizing element to the victims. The *Caledonian Mercury* printed the story of a slave named Davy who had both of his arms broken prior to being hanged for promising to kill ten white men, a severe punishment for boastful talk. It was only these moments of uniqueness, or moments when the victims of state violence were personalized, that the reader felt any real impact. According to Gatrell (1994 p. 283), it “took an imaginative effort or personal shock to realize that the concept of normality failed to connect with the fearsomeness of what happened,” and so when newspapers made a concerted effort to identify and personalize the victims of state violence, those stories became more meaningful.

The *Caledonian Mercury* reported on October 1, 1760, of a man named Pompey, who was purported to be one of the leaders of the rebellion and was posthumously decapitated, while Jamaican authorities executed another man named Harry in Spanish Town for “being principally concerned in the contriving and intending to carry on an insurrection at Louidas.” The *Oxford Journal* of August 23, 1760, published an additional detailed report on the fate of specific slaves. The authorities executed Quaco and Antony, both accused of having taken part in the rebellion, by burning one at the stake and hanging the other. Their female counterparts, Sappho, Princess, Sylvia, and Doll, watched the executions “with Halters round their Necks,” and then the government banished the women from the island.

The punishment of banishment, through rarely reported, must have been common. Among the laws passed by the Assembly in December of 1760 was an Act designed to “prevent a Captain, Master or Super Cargoe of Any Vessel bringing back slaves Transported off the Island.” Years after the rebellion in July of 1764, the *Caledonian Mercury* reported on the last of the “untractable Negroes, whose Savage Natures nothing could subdue” were sold off the island. Deportation was a common fate assigned by the state to women in the early nineteenth century West Indies, and so it is likely that a similar treatment was often reserved for slaves in the British colonies. But banishment is hardly as exciting as gibbeting and hanging and conflagration.

There was a second narrative constructed by the newspapers, focusing on the strength and resilience of the condemned. If providing names made them more human and telling only tales of bloody executions made them more interesting, the stories of boldness and strength in their death throes portrayed the slaves as strong and, in some ways, sympathetic. The *Oxford Journal* of July 26, 1760, reported that the slaves who were hanged in chains
alive for their crimes managed to survive for 8 days, and the Leeds Intelligencer of July 29 that year included commentary about the survival of one slave for 2 days in the same condition. The Dublin Courier of August 6 went furthest in painting the slaves with a sympathetic brush. The whites of Kingston captured, tried, and condemned a group of slaves to be gibbeted alive 20 ft high and survived for 9 days. In those 9 days, they, allegedly, complained not about the excessive heat (as would be expected on a tropical Caribbean island) but instead “they complained more of the cold in the night.” The rebels, despite their treason, showed strength even in the face of impending and inevitable death. The authority tried the slaves, found them guilty, and condemned them to die.

In 1760 Tacky and his fellow African rebels stood as conflicted figures in British discourse. They were both the inhuman savages born of the Caribbean and familiar sufferers under the lash of imperial authority. As familiar as the enslaved could become, there was still a clear othering underway, as the mythology surrounding black resilience to heat and violence undergird these stories. Nevertheless, through reports of these rebellions and punishments, the struggles of slavery and empire came flying back across the Atlantic into the cities and towns of Great Britain. Resistance by the enslaved forced the discourse of loyalty, punishment, and amelioration into the public view. Acts of resistance could force even distant public attention onto key issues of imperial policy and racialization, and Tacky’s Rebellion was one such act. Eighty years later, after decades of growing restrictions and continued violence, the British had one final moment to confront the resistance of the enslaved.

Part 2: The Baptist War

In 1831, 2 days after Christmas, the specter of a second Haiti transformed itself into reality as thousands of the enslaved in Jamaica effectively went on strike. Led by educated and well-traveled slaves, as well as free people of color and Baptist missionaries, the strikers set out to nonviolently, and with due loyalty to the crown, declare and confirm their rights as free men. The enslaved in Jamaica believed, as many rebellious slaves in history have, that the crown had granted them their freedom and but for the machinations of planters, slavery would be gone. The Baptist missionaries, for whom the conflict came to be named, served both as white allies to black Jamaicans and, as described by Reckord (1968), as sources of unification and communication through religious services. In the end, according to Craton (1982), upward of 60,000 black Jamaicans joined the rebellion at its height, and the total death count of the response exceeded 500 black and 14 white Jamaicans.

The rebels’ first act of resistance, and the initial spark to large-scale violence, was the burning of the Kensington Estate. This conflagration served as a signal to the larger population of agitators who attempted to mobilize around a series of well-known black leaders including George Taylor, Thomas Dove, and, most famously, Samuel Sharpe. According to Craton (1982), Sharpe sought to organize a resistance
to work on a large scale to force the issue of freedom, and while his lieutenants may have had more violent intentions, Sharpe at the very least sought a peaceful recognition of freedom. The rebellion quickly spread across a range of parishes and soon the island was at risk again. In response, the governor called upon both the militia and the British regulars under General Willoughby Cotton. As was so often the case in rebellions in the plantation colonies, the slaves were unable to unite their disparate forces from across island and in short order the rebellion was surprised, and reprisals began.

1832 represented a moment of change across the British Empire, the Reform Act of 1832 drove political reform into public discourse, and the long years of abolitionist activism had brought the end of slavery into sight. This left the traditional authorities in panic in Jamaica. Their power and control was under siege by both reformers at home and abroad and the black Jamaicans who struck out to secure their freedom. To satisfy the bloodlust of the aggrieved planters and enact a perverse justice for the uprising, the Jamaican Assembly and British military put hundreds of slaves to death. The government executed Sam Sharpe, one of the key leaders of the rebellion who was also a Baptist preacher, on May 23, 1832, and thoroughly and broadly put down the rebellion. Though from the perspective of the British public, this was merely the start of the troubles. While the British newspapers were sparse in their depictions of the narrative of the rebellion, they examined the response by the Jamaican government in detail.

Some newspaper articles, such as one published by The Examiner on February 26 in 1832, focused on the critical role of labor in relation to the rebellion. In this version of events, the enslaved rose up not for their freedom but out of an unwillingness to work. The Examiner argued that the slaves “expressed their determination not to work after New Year’s-day” and reported that “nine-tenths of the slave population had refused to turn out to work” in Trelawney. Despite planter attempts to discredit the slaves, newspapers in Britain by and large did not see the insurrection as an act of wanton violence and savage killing but overwhelmingly as a civil dispute over labor and liberty. Given the context of reform and the civil unrest in Britain, including the 1819 Peterloo Massacre and the 1830 Swing Riots, the violent resistance by unhappy laborers would have been familiar. But were these rebels to be understood as fellow strugglers or racial others?

The Bristol Mercury of April 28, 1832, directly addressed the question of who these rebels were by positing whether a relationship of total or limited dependency led to the best results for workers. In a lengthy reprint of an article from the Quarterly Magazine and Review, the Mercury asked:

Whether, as a general truth, it is best for a labourman to labour as an hired labourer or as a slave? Whether it is best for him to labour for wages which shall be his own, or to be dependent upon his master for what he shall please to give him? Whether it is best for him that his wife should be independent of his employer, or should be his master’s slave? Whether it is best for him to be subject to no penalty except for his own crimes, or to be liable to be sold for his master’s debts? Whether it is best for him to be secure from punishment until found guilty on fair and open trial, or to be left as his master’s discretion to be flogged, imprisoned, and tortured whenever his master pleases?
At the heart of the discourse over the rebellion was the assumption that the slaves in Jamaica were laborers and therefore subject to British law. This represented a radical change from the rebellion in the previous century, where newspapers described the rebellious slaves as foreigners, acting in their own interests and not as members of the larger British polity. In the case of the *Bristol Mercury* of April 28, 1832, the editors described slaves as men and fellow laborers and “unoffending British subjects,” with “an unquestionable right to the King’s protection.”

Considering this growing rhetorical connection between British laborers and Jamaican slaves, the planters needed a scapegoat for the outbreak of violence, and they needed it for two very specific reasons. First, the rebellion brought into sharp focus Jamaican relations with the capital and Jamaican portrayals of Africans and racial slavery in popular culture. As illustrated by Andrew O’Shaughnessy (2000), ever since the American Revolution, a political divide had sundered the West Indians from their domestic cousins. In many ways this separation went back even earlier and encompassed not only cultural differences developing between the West Indians and their British counterparts but also questions over the loyalty of the white merchants and planters during times of crisis. These questions did not dissipate in the half century following the American Revolution, and in the months after the Baptist War, the question of West Indian loyalty reemerged. In April of 1832, a group of West Indian notables met to discuss British policy for the colonies and slavery, and as the *Hereford Journal* of that month reported, “if relief cannot be afforded them by the country to which they profess allegiance, why not permit them to transfer that allegiance to America?”

The second cause for concern among the Jamaican authority was a response to the reports of large-scale judicial violence in the wake of the rebellion. If the slaves were merely laborers seeking redress, what justification could exist for reactionary violence on such a scale. In a world within memory of the Peterloo Massacre, the news of brutal retaliations on laborers was scandalous, all the more so because some of the punishments came down upon the heads of white Baptist missionaries. To defend themselves, the planters went to the press to paint the missionaries as responsible for inciting rebellion. In a February 20th letter to the *Caledonian Mercury*, a planter reported that the “poor deluded slaves” were led into the rebellion by “these canting incendiaries.”

By attacking the missionaries, the Jamaican planters were reacting against an active opposition to their power, an opposition that had mobilized its presence in the British popular discourse. The *Bristol Mercury* of February 22, 1831, a full year before news of the rebellion would reach Britain, printed a diatribe against the planter elite of Jamaica taken from *The Anti-Slavery Reporter*. The story described the slave owners not only as ungrateful to the point of near disloyalty but also as “anti-Christian” and full of “ancient and most inveterate prejudices.” West Indian slaveholders were therefore on the defensive long before the rebellion broke out; the rebellion just gave them both a need and an active opportunity to paint themselves the victims.

The Jamaican white leadership not only portrayed their enemies as misled but in turn took on the mantle of the oppressed for themselves. In an April 26th article
published in the *Cheltenham Chronicle* in 1832, the slave owners made clear the battle lines drawn up on the island: “There is however, one comfort – that the day is past when the opinion of the government of the mother country has any weight with the inhabitants of Jamaica. A faction has vowed our destruction; but while we have the command of 25,000 bayonets, with British hearts to wield them, we shall laugh at the opinion of our oppressors.” The language of oppression was entirely reversed. Now it was not the slaves who were too busy, according to the *Hampshire Advertiser* of April 14, 1832, displaying the “symptoms of sullenness and indisposition to labour,” to be oppressed, but instead it was the whites and landowners who had to put up with the burden of British supervision.

Domestically the planters argued that, far from being cruel and heartless masters, they had in fact behaved with an open and generous hand. In a memorial of 1832, the Jamaican Assembly remarked upon the “unusual Indulgences . . . granted to the Slaves by their Masters” and deplored the knowledge that “the Leaders and Chief Promoters of the Insurrection should appear to have been almost exclusively composed of Persons employed in confidential situations” and “belong[ed] to a Class of People to whom additional Comforts are afforded by the Masters.” The white Jamaican leadership felt betrayed, by the missionaries who misled the slaves, by the slaves who cast aside their well-earned loyalty, and by the British Government, leaving them alone to face this monumental task. A fair number of newspapers across the British Isles took the planters at their word on these betrayals, and many more may have had it not been for one vital decision in the aftermath of the insurrection.

This understanding of oppression and fear was not just a public relation move, it was real, or at least real for the Assembly of Jamaica. In the wake of the 1760 rebellion, the Assembly had focused on suppressing African cultural legacies and the freedoms of persons of color in Jamaica. The planters had pushed back at any suggestion that they take on the burden of providing for their own defense or any calls for easing the burden on the slaves. 1832 represented a radical shift in that regard. Not only did the Assembly pass a series of bills relating to the funding of militia, repayment of debts accrued during the war, and “An Act for the Relief of Insolvent Debtors Imprisoned for Debt,” but they went even further and funded updates to the security apparatus of the island including the establishment of a permanent police force.

The 1760 revolt had led to immediate legal action against African traditions and civil freedoms for people of African descent, whether enslaved or free; however, this was not the Assembly’s immediate response in 1832. Instead the Assembly’s focus was overwhelmingly on funding, paying for, and reestablishing a civil defense force, and this included rewarding and expanding the role of the maroons within Jamaica. In written reactions to “an event which will be deplored as having brought ruin and devastation to one of the most fertile districts of the Island,” the Assembly behaved somewhat subdued when they avoided the fiery rhetoric shared in the newspapers and instead used the language of despair, disappointment, and melancholy.

The examinations of slaves and whites recorded during the aftermath of the rebellion revealed a great deal, but the problem for the planters was that it made
them as guilty as the “sectarians.” In his testimony before parliament, Lieutenant-Colonel George Codington summed up the two influences he believed had led to the outbreak of violence:

My opinion of the cause of the rebellion is, in the first instance, the agitation of the question both in the newspapers in England and in this country, and its being imprudently discussed by the proprietors themselves in the hearing of the slaves, thereby making them acquainted with those improper opinions which are very often expressed in those publications. In the second place, by the imprudence of the sectarians in their language addressed to the slaves.

This was not the smoking gun the planters needed to justify their tyrannical response to the Baptists in the British press.

While one trend of newspaper stories clearly followed the Jamaican white party line, the second was critical both of the slaves for committing acts of violence and of the Jamaican planters for their decision to target the missionaries as culprits. Newspapers in Britain reported on the trials and punishment of various missionaries, including the execution of Sam Sharpe. These newspapers portrayed the missionaries not as traitors who were responsible for the inciting of slave rebellion, but lambs sacrificed to the greed and wanton cruelty of the barbarous planters. Between newspaper articles, anti-slavery societies, and interested activists who wrote letters to the editors, a collection of defenders united in the British press to rally around the accused missionaries. Importantly it was not the plight of the enslaved that moved them to action.

The primary focus of this defense was on a small cadre of men, including three noteworthy ministers, Knibb, Whitehorse, and Abbot, who became the standard bearers for the oppressed religious leaders in the West Indies. In their name, men like J.G. Fuller and other activists argued in defense of the religious ministries. In a letter to the editor of the *Bristol Mercury* in February of 1832, Fuller argued in the *Bristol Mercury* of February 28, 1832, that some of the accusations against the anti-slavery advocates were “too contemptable for formal refutation,” and it was not possible that “these men are guilty, though a host of rebels may rise to condemn them.” Certainly, this was no defense of the slaves; in fact, the slaves themselves rarely came up in these missives. But Fuller reserved his greatest vehemence for those defenders of slavery who slandered the missionaries. Fuller identified these men as villains whose “impure lives are a stigma on man who have professed unblushingly the horrid principles of Atheism” and were men who were “haters of morality... the lovers of sensuality.”

Another activist and anti-slavery agitator, the Reverend John Dyer, secretary of the Baptist Missionary Society, wrote a similar letter to the editor of the *London Evening Standard* in February 1832. For Dyer, the pro-slavery forces were not just lacking in character but were in reality the true bringers of violence to the West Indies. Dyer was unsurprised that the planters once again sought to frame the missionaries, but Dyer believed that “the blameless and inoffensive” preachers had long suffered from the “causeless hostility” of the planter elite. Dyer did not seek to examine the causes of the “lamentable disturbances” rocking Jamaica “or what grievances, real or supposed, may have led to the destruction of property which
has taken place”; instead he focused his ire and attention on the attempts by the white planters to target and punish the missionaries.

Both the proponents and opponents of slavery made skillful use of the language of loyalty. When Reverend Thomas Burchell stood accused of instigating the rebellion, it was claimed by the Chester Chronicle of May 11, 1832, that for Burchell to leave Jamaica would be “dishonorable,” despite the “unnecessary roughness” doled out to missionaries at “the instigation of the white inhabitants.” In the Chronicle, it was made clear that that loyalty and honor belonged to the missionaries and roughness and cruelty to the white inhabitants of Jamaica. Again, the slaves were secondary to the narrative, and in this article the Chronicle made only one passing reference to the slaves (calling them the “colored inhabitants”) and no reference to the damages done by the slaves to the plantations.

The Chronicle did mention damage done to the Baptists; specifically it referenced the destruction of the Baptist chapel in Montego, not by the slaves but by the whites of Jamaica. The Liverpool Mercury viewed with some trepidation the violent rhetoric of the Jamaican Courant and believed that the missionaries had no logical reason to incite a rebellion they could not hope to win. But when the Jamaican Courant stated that there were “fine hanging woods” and hoped “that the bodies of all Methodist preachers who may be convicted of sedition may diversify the scene,” it left the editor of the February 24, 1832 edition of the Mercury with real concerns about the fairness of a trial in Jamaica. With the end of the period of martial law, according to the Coventry Herald of May 4, 1832, the whites were able “to wreak their vengeance, in every possible mode... in the illegal and atrocious outrage.” It was not just that the whites were in power and of questionable loyalty, but they were in fact the savages, as the Drogheda Journal of March 10 made explicit. Resistance to white cruelty and planter savagery was to become a rallying cry, and the Journal believed “the whole British nation will learn against what virulent hostility they [the missionaries] have to contend.”

For many in Britain, the Jamaicans, and specifically the white Jamaicans, were untrustworthy, violent, and disloyal; meanwhile the missionaries were oppressed, under assault, and ill-treated. The slaves made very few appearances in these articles, as the focus rapidly shifted from the story of the rebellion itself. Religious minorities in Britain did not represent a unified political or social front, and it is hard to describe en masse the attitudes of non-conformist religious groups as it related to reform in the nineteenth century. As religious outsiders and a minority group within the Empire, the Baptists would have been to some degree outside the norm. But not so far outside as to be exiled and kept away from the structures of power. While it took an act of emancipation to normalize Catholic relations within Great Britain, other religious minority groups had less difficulty in achieving success and reform in high office. The significance of race and freedom becomes all the more visible when read in the light of the popularity of the Baptists in popular press.

While most of the stories stated that the missionaries had escaped actual punishment, the Dublin Morning Herald reported in April of 1832 that one missionary had been executed as a result of court-martial. And in the Fife Herald, of May 10, a newspaper heavily critical of the slaves thus far, the treason of the planters became
enlarged to cover the entirety of the West Indies, where “there is a secret understanding among the leaders of the Assemblies of the different Islands, and that they are determined to bully the Government.” In the extreme, the whites of Jamaica were murdering innocent missionaries and plotting a mass betrayal of the British government.

West Indian influence was on the wane, and their only attempts at influencing the newspapers came in the form casting blame upon the missionaries, whereas the missionaries countered with claims of cruelty, savagery, and disloyalty. It was as though the planters had become the slaves, replacing the savage African pagan with the violent and cruel white overlord. The language used in the criticism of the planters, words like savage, vengeful, and hostile, was specifically designed to negate the complaints of the planters. White West Indians had portrayed the slaves as docile or calm by nature, subservient to their masters who in turn were held to the expectation of a certain noblesse oblige. All the while the actual victims of white violence, bondage, and the centuries of racially justified slavery remained pawns in the hands of white policymakers.

While the planters argued that it was the missionaries who turned the slaves to violence, the missionaries made a far more compelling case that it was in fact the planters who delivered violence to the West Indies and not the slaves. It was notable that even anti-slave story printed in the Durham County Advertiser in February of 1832 took measures to point out the generally lack of violence in the rebellion when it made note that “great damage has been done to property, but not much to life: the slaves seeming to be more eager in burning the houses, and devastating the plantations, than in offering violence to the persons of their employers.” The slaves were merely “poor ignorant fellow-creatures” who did not know any better. But the planters were educated and wealthy whites who looked the Empire in the eyes and plotted behind her back. They struck out with savagery, violence, and vengeance, destroyed houses of worship, and killed missionaries. It was thus unsurprising that sympathy should so quickly and decisively fall on the side of the abolitionists.

**Conclusion**

In the reports of 1832, we see again what occurred in 1760: both in the depictions of the rebellious slaves as sympathetic or relatable and in the criticism of the planters as complicit in bringing about the crisis. While the planters roundly ignored calls for amelioration in 1760, in 1832 emancipation was inevitable. But in both cases, there was a clear dialogue in the British press over the legal and political realities of the Jamaican situation and the presence of a public understanding that Jamaican slave resistance was fundamentally a part of the Atlantic world. By examining these two keystone moments in resistance to slavery, we can uncover both how the British people understood their empire and how much race and slavery played a role in that understanding. Bondage, the violence of slavery, and the human trafficking that made it possible all played a fundamental role in the ideas of British imperialism, race, and labor, in the eighteenth and nineteenth centuries.
Driven by the actions of enslaved men and women, these moments of illumination forced Britons in some small way to confront the realities of a system of bondage that defined a centuries-long colonial project. If the systems of slavery play a fundamental role in how historians understand empire in the modern and early modern world (and they must), then so too does resistance by the enslaved play a role. Even in situations where the institution of slavery was not a real threat, and the racial order of white supremacy was not undermined, acts of rebellion brought slavery into view for the distant observer. If, as Randolph Starn (1971, p.4) has argued, moments of crisis represent times when the “national character and institutions were thought to have been decisively shaped and tested,” then we must consider the impact of enslaved, fighting against their enslavement challenged had on the national character and institutions of the British Empire, as well as the other slave holding imperial powers of the eighteenth and nineteenth centuries. The legacy of both the challenge that slave rebellions created for imperial powers and the impact those acts of resistance had on directing public discourse can still be seen in the twenty-first century. Civil disobedience, protests, rallies, and marches may not bring direct results (in the same way that the rebellions of 1760 and 1832 did not end slavery in Jamaica), but they do force observers, even those thousands of miles away, to see and discuss the violence and oppression of imperial systems. We are left then to see plainly that rebellion by those trafficked in human bondage and their descendants must be central to our understandings of the making of the modern world.

Abstract

The post-emancipation era was defined by the United States’ attempts to come to terms with the loss of slavery and to renegotiate its economic and political position in a global context. By moving slavery into the historic past, politicians remodeled the United States as part of the antislavery alliance with Britain and other European nations, for whom slavery and its eradication was approached with a missionary zeal, representing a key pillar in their imperialist foreign policy. However, many in the United States were unable to consign slavery as quickly to the history books, and slavery and its legacy was a hugely significant issue as the United States grappled with its own identity on the world stage, with the practicalities of coercive labor practices within its own borders and externally, and with the hardening racial doctrines enabled by theories of social Darwinism that seems to militate against the healing of the wounds caused by almost three hundred years of forced labor practices. Domestically, systems of convict labor and debt bondage kept African Americans and some new immigrants trapped in labor systems akin to slavery, while overseas, as the United States became an

imperial power, slavery was used as a justification for intervention, for rejection of imperialism, and as a means to deploy inferior races in civilizing employment, who otherwise would not work. Defining a group of workers as slaves was a rhetorically powerful act during this period, as it became a means for conservatives to control and exclude Chinese laborers from the American body politic, as well as a means to control and limit women’s sexual work by labeling even voluntary prostitution as white slavery. Pointedly observing the inherent racial traits that allowed the continued existence of slavery overseas, for example, in Africa and the Middle East, was a way for the United States to define itself as an antislave power alongside its European competitors. In fact, the rhetoric of this period was defined by the racial othering of both slave and slave owner as the United States used slavery and its legacy to construct a new role on the world stage.

In December 1865, with the ratification of the thirteenth amendment to the US Constitution, the nation drew a line under the part of its history involving chattel slavery and moved forward into an era in which “neither slavery nor involuntary servitude, except as the punishment of a crime, whereof the party shall have been duly convicted, shall exist within the United States or any place subject to their jurisdiction.” Leaving aside for a moment the very important caveat within the amendment permitting such labor systems as part of the criminal justice system, this text in one swoop converted the United States from a slave-owning nation to one in which such forms of labor were illicit. By moving slavery into the historic past, politicians remodeled the United States as part of the antislavery alliance with Britain and other European nations, for whom slavery and its eradication was approached with a missionary zeal, representing a key pillar in their imperialist foreign policy. However, many in the United States were unable to consign slavery as quickly to the history books, and slavery and its legacy was a hugely significant issue as the United States grappled with its own identity on the world stage, with the practicalities of coercive labor practices within its own borders and externally, and with the hardening racial doctrines enabled by theories of social Darwinism that seems to militate against the healing of the wounds caused by almost 300 years of forced labor practices.

Much of the evidence for this chapter comes from the period prior to the outbreak of World War I, although a few later examples illustrate continuities beyond that era. In the period between 1865 and 1914, definitions of slavery were malleable and mutable, as slavery became something that others practiced, while discourse around “our old slavery days” – antebellum slavery – also evolved into a pernicious nostalgia that served to further belittle and limit the achievements of the freemen and
women struggling to find their place in the changed nation. In the hands of some commentators, slavery became a dirty word, an accusation flung at the ethnic other, especially when slavery was perceived to threaten white women at home or abroad. For others the rhetorical battle over the meaning of slavery was waged to prove that emancipation was only partial and that African American enslavement still stalked the new expanding United States. The thirteenth amendment allowed for some slavery and involuntary servitude, as a punishment for criminal transgression. Convict forced labor had a long history in the North American colonies and throughout the British Empire, especially, although not solely, in Australasia. It was an economic enterprise as well as a means of controlling the behavior of particular underclasses and a way to keep transgressors off the streets and thus protect law-abiding citizens. All of these aspects that appear in the form of convict labor that emerged in the Southern United States after the end of slavery, and also in the debt bondage system of sharecropping, were consciously chosen replacements for newly illegal chattel slavery. Debt bondage had also been practiced alongside slavery in the antebellum era (Daniel 1972); thus this period is one of significant continuity with the antebellum era, as racial and class control was exerted by members of the hegemonic elite through systems of coerced labor both before and after the Civil War.

On the other hand, significant changes were wrought at this moment, and perceptions of slavery rapidly evolved in 50 years after emancipation. This chapter will first explore the conceptual legacy of chattel slavery and show how popular and elite print culture used the idea of our “old slavery days” to entrench a sense of the superiority of the white, Protestant, nativist vision of the United States. It will also show how new forms of coerced labor did the same work for the nation trying to come to terms with the cataclysmic Civil War. This was a period in which the United States considered its place on the world stage for the first meaningful time since the War of Independence, and this context illustrates why global slavery became a concern for Americans. Despite fashioning themselves as exporters of emancipation, Americans of all races often did so while adopting and adapting Social Darwinist views about the hierarchy of races, and they used such concepts to “other” the slave owner as they had once “othered” slaves and as they continued to “other” the freemen and women. Women became particularly important to discussions about slavery perpetrated by “others,” both domestically and on an international stage, as attempts to enforce ideals of domesticity onto white women led to their being given an artificial victimhood in the white slave panic and in discussions about Arab world slavery. This chapter will acknowledge that coerced labor was still a reality in the United States after emancipation but crucially that rhetorical debates over the definition of slavery and the nation’s role in ending it reflect a tendency to deny the horrors of chattel slavery, to romanticize the victims’ relationships with their abusers, and an inability to reconcile the history of the slave past into the identity of the nation. Evidence for this comes from a range of textual and visual primary documents, including newspaper articles and cartoons. The significance of these artifacts of popular culture is complex; therefore they will be treated in a methodologically sensitive way, understood to be neither solely reflecting nor creating cultural change.
Slavery Within the United States: Coerced Labor Continued and the Nation Fails to Understand Its Past

In practical terms, the emancipation of African Americans in 1865 was partial at best. Their inferior treatment in all aspects of life in the Jim Crow era is not news, but it is important here to highlight ways in which systems of coerced labor continued to exist after 1865 in the United States. African Americans were not the sole victims of these systems; many poor white Americans from a range of ethnic backgrounds were ensnared in systems of convict labor, share cropping, and indentured servitude until the outbreak of World War II. Their mistreatment was similar to that of black Americans because it resulted from the actions of a vulnerable hegemonic power within the nation, which was desperate to reinforce its position of control in a rapidly changing world. However, the virulence of the assault that freemen and women experienced in the aftermath of the Civil War was unique in its intensity, and it is no surprise that African Americans made up vastly disproportionate numbers of convict and coerced laborers. In this era the system of oppression felt through extralegal intimidation such as lynching was also targeted primarily at black Americans.

The convict labor system was not only of a moral equivalence to chattel slavery but might be considered a system of slavery (Blackmon 2009). The entire legal system was rigged against African Americans, capturing those innocent of any crime and by rapidly expanding the activities considered against the law. Frederick Douglass offered statistics proving that the convict leasing system was inherently racist: when he wrote, ninety percent of Georgia’s convicts were African American (Douglass 1893). In contravention of the thirteenth amendment, which required any criminal undertaking involuntary labor to have been convicted of a crime, many of those in the convict labor system had not had a trial but were advised by a corrupt judge, in collusion with men desiring unfree laborers for their agriculture or industry, that the best way out of the predicament was to agree to work to pay off their bond. The often-illiterate accused signed documents they were unable to comprehend with no legal representation and later often had their prison term arbitrarily extended for minor transgressions or to cover payment for food or clothing. Treatment of the convicts often amounted to abuse little better than the excesses of chattel slavery: harsh, sadistic punishments; poor food, accommodation, clothing, and medical treatment; and very long working hours with no notion of how they might become free. The uses of convict labor are many and include industry, for example, coal mining in Pennsylvania and public improvements, such as road and railroad construction, especially in Florida, and agricultural work throughout the south. As well as the economic benefit to the businessman of having cheap laborers, the state did not have to house these individuals (a real boon after the devastation of the Civil War), and their labor could be employed in times of labor unrest to strike break. The industrialists kept fields, factories, and mines working in the face of labor protests, and such activities further served to pit black laborers against white laborers. Southern states also used prisoners to labor within their walls and still do. The notorious Parchman prison farm, part of Mississippi State Penitentiary, was founded in 1901 and was deliberately structured as a plantation from the chattel slavery era.
The regime there, which notoriously included white supremacist James Vardaman and his interest in hunting convicts on horseback for entertainment, was worse than slavery (Oshinsky 2009). These examples show how after emancipation the definitions of slavery were contested and assumptions were made that antebellum chattel slavery was the archetypical “slavery” against which all other coercive regimes must be judged. The convict leasing system finally began to wane in the early decades of the twentieth century due to public disquiet, the decrease in profitability, and the increase in the number of penitentiaries, offering an alternative way of dealing with prisoners.

Often, those African Americans not ensnared by the criminal justice system found themselves trapped in a cycle of debt that bound them to their former master. Despite the tendency of many former slaves to try to find work in the northern or western parts of the country, many others were reluctant to do so, partly because of the system that defined an African American traveling away from home as a criminal vagrant. Such dependency on the former systems of enslavement left a crippling psychological legacy on the freemen and women and perhaps helps to explain why so many strategically internalized the racism of the Jim Crow era and reproduced it so frequently in the WPA narratives collected in the 1930s, where they talked in fond terms about former masters and plantation owners after slavery. Photographic evidence from the 1930s, also collected as part of the New Deal initiatives, indicated that poor white families were also caught in sharecropping, again with few opportunities to escape their entrapment. Although sharecropping initially presents itself as unlike slavery, in the autonomy it allowed its laborers, many were unable to move from one employer to another because of their indebtedness, a situation which employers (masters) did little to discourage or alleviate. In many southern states, it was against the law for a sharecropper to leave their master without paying off the debt; thus the master’s control was facilitated by the legal system, allowing him to restrict the movement of his laborers without resorting to the chains of chattel slavery.

Occasionally the legal system was deployed to construct a new definition of slavery that did work in the favor of the disadvantaged laborer. There was an appreciation that the abusive and sadistic treatment of labor, for example, in cases of physically restraining employees, was no longer acceptable in the postbellum world. This mirrors some proslavery discourse about slavery emerging before the Civil War, which emphasized fair treatment of laborers resulting in efficiency, good economy, and the opportunity for slave holders to display “civilized” values, all of which worked to enhance the status of the slave owners in the eyes of his white peers. Similarly, in the late nineteenth century, many in the south understood that the integration of their cultural and economic institutions back into the United States was predicated on establishing and enforcing certain standards. For example, in 1903, in the state of Georgia, there was a series of trials convicting plantation owners of peonage and the use of physical violence to coerce and restrain laborers, in violation of the 1867 act against peonage labor.

Other similar forms of bonded labor existed throughout the United States, such as peonage in the American Southwest (Kiser 2017) and padrone labor in the fruit industry of the Atlantic coast (Hahamovitch 1997). Forced labor activity was
common during the nineteenth century, but there were isolated incidents of coerced labor practices until the outbreak of World War II. These two regional systems relied on financial entrapment of a vulnerable group, alienated either by poverty, a lack of language skills, or by ethnic discrimination. As with African Americans in the south, both migrant labor on the East Coast and peons in the Southwest accepted their status and even had gratitude for the opportunities and protection offered. Often these laborers did not consider themselves enslaved or coerced, and in many ways, their plight was little different to those trapped in poverty in many parts of the United States. In the period after the Civil War, the term “slavery” expanded into “modern-day slavery,” no longer referring solely to a specific economic relationship but rather as an umbrella term encompassing many types of coercive labor situations.

However, during the late nineteenth and early twentieth centuries, reference to the term “slavery” almost always required a comparison with times past. During this period the stories told about America’s antebellum labor system evolved dramatically. The conservative, nostalgic telling of the stories about “our old slavery days” reconstructed the chattel slavery era as a feudal golden age of mutual dependence, love, and respect between the races (Van Deburg 1984). According to this rhetoric, antislavery activists had been a corrupt and hypocritical influence, deliberately trying to break apart the United States, with no genuine love for the African American, whose fate would have been far safer in the hands of southerners, more experienced in handling the so-called Negro problem. The earliest historians of slavery such as Ulrich B. Phillips, the son of a Georgia slave owner, emphasized this when studying the plantation records of the recent past, ignoring the voices of the enslaved themselves. This analysis of the past mirrored the attitudes of many Americans, who, especially after a generation had passed, had begun to doubt that the ending of slavery was a good enough reason to justify the mass bloodletting of the Civil War, which saw approximately 750,000 deaths. A counter narrative also emerged of heroic abolition, of which Abraham Lincoln became the icon. This story foregrounded the activity of white campaigners, who offered inspiration to a new generation of social reformers targeting alcohol abuse, prostitution, and other morally unhygienic phenomena. African American thinkers contributed to this assessment of the legacy of abolition, and countering with tales of the powerful racial origin of Africans, their ongoing resistance to the rhetoric of a benevolent slavery continued well into the twentieth century. However, American conceptions of slavery were not solely influenced by domestic experiences. The international context of antislavery imperialism was increasingly important to Americans’ understanding of the complex definitions of slavery as they created their own “moral empire” (Tyrrell 2010).

**Antislavery Imperialism: The Influence of the International Context**

As the nineteenth century progressed, the United States was increasingly sensitive to perceptions from overseas, especially from Europe, about its relationship with slavery and the slave trade. One European nation after another redefined their
attitudes toward unfree labor and crafted an identity as antislavery nations. The British definition of modernity and civilization in this period was one that rejected slavery within its own bounds and saw it as a duty to carry that message around the world. Of course, this antislavery imperialism was problematic in that it was often hypocritical in its treatment of labor of subject peoples, professing to spread anti-slavery throughout its imperial territories while simultaneously recognizing that coercion was required to remodel these regions as capitalist, modern colonies. This hypocrisy reached its nadir at the turn of the twentieth century in the awful abuses seen in the Belgian Congo under King Leopold, which caused an international outcry and triggered further antislavery activism, this time critical of the imperialist agenda in the United States led by George Washington Williams and E. D. Morel. During the Civil War, the United States signed up to treaties with the British agreeing to act against the illegal transatlantic slave trade and then rendered its own system of slavery illegal. The Civil War era had forced sober re-evaluation, and after much delay, some politicians seemed ready in the last quarter of the nineteenth century to see the United States join its European rivals in global antislavery activities of its own.

The United States’ role as an imperial and antislavery nation had painful birth pangs, often debated within the popular and elite literature. The nation’s birth a century earlier had explicitly rejected empire and led to a suspicious view of European empire building (McCarthy 2009). However, economic and strategic imperatives in the Pacific and Caribbean, as well as the nation’s interest in African matters due to its own African diasporic population, led to a more global outlook. Following the British rhetoric, much of the United States’ involvement in overseas adventures that led the nation to imperialism was justified through proclaiming benefits to the colonized people: commerce, Christianity, and civilization. Underpinning those was the idea that slavery, wherever it was found, must be rooted out, as it was now considered contrary to those social, cultural, and economic goals. These attitudes had changed quickly in the United States. During the Civil War, the Confederacy in its more exuberant early days considered spreading a plantocracy not only across the continental United States but also overseas. In the period immediately prior to the war, apologists such as George Fitzhugh defined chattel slavery and serfdom as the more modern labor systems, preferable to the metaphorical enslavement of free labor. But, influenced by powerful European ideas, the American pro-imperialist faction remodeled the nation as one carrying civilization to dependent and inferior races, and one of the main facets of this mission was to stamp out retrograde labor practices such as slavery. This argument was also deployed in the domestic sphere, as General John Sanborn justified encroachment into Native American territory suggesting that US jurisdiction there would allow the nation to protect those formerly enslaved by tribes such as the Creek, Choctaw, and Cherokee (Krauthamer 2013). This antislavery rhetoric was especially powerful in the 1890s on an international level during the Philippine occupation but also appeared in discussions of Cuba and Hawaii. In the Philippines, the targeted “Moros,” not only slave holders but Muslims, were perceived as standing in the way of progress and abusing their own people, injustices that US soldiers on the ground were powerless to influence, but that peppered
antislavery rhetoric back home. In 1912, discussions of Philippine slavery also affected the presidential election as Howard Taft campaigned to delay Philippine independence because of their inability to stamp out slavery, despite its legal abolition in 1903 (McCoy 2009).

This antislavery imperialism did not go unchallenged, and perceptions of misguided foreign adventures and of the hypocritical behavior of imperialists were frequently discussed in text and visual form in newspapers. Anti-imperialists such as Democrat William Jennings Bryan and the Anti-Imperialist League were often conservative and evoked racially deterministic ideas to dissuade the American public of the sense of holding overseas colonies. It was American imperialists who tended to challenge the racial outlook of their day (Love 2004). Anti-imperialists held the view that to bring such polities into the American fold would dilute the purity of the American people, and the specter of inferior races having a say within the American political system was raised to frighten a weary populace, already grappling with its own “Negro problem.” Other more moderate anti-imperialists felt that the nation was simply unready for such colonial activity, having so recently been wrenched apart in war.

The justification of imperialism was contested when examining the US relationship with Africa. Imperialists saw the opportunity to match European economic and strategic success and felt that Americans were being left behind after the Berlin Conference of 1884. African American commentators grappled with the complexities of a global awareness of the role of people of the African diaspora. The descendants of those taken in the slave trade felt a strong affinity with the people of Africa, but their understanding of their own role in the spreading of civilization was complex. Some felt that the advanced nature of African civilization was underplayed by white hegemons in Europe and the United States, for reasons of racial and economic expediency, and such a view was expressed in 1895, at the Atlanta Congress of Africa, while others felt that members of the African diaspora did indeed have a role to play in returning to Africa as educators, sharing the lessons about agriculture, development, and progress that had ironically been forced on them through slavery. The experiments, first by Martin Delany and others in Liberia and later by Booker T. Washington in Togo, reveal this controversial use of colonialist attitudes toward indigenous Africans. Martin Delany’s views toward Africans were tainted by ideas of racial hierarchy, and while he espoused a black nationalism on a global scale, he also viewed African Americans as representatives of a higher civilization (Whyte 2015). Booker T. Washington’s Tuskegee Institute sent representatives to German Togo in 1901 to educate Africans on how to be capitalist, free laborers who could cultivate cotton in the same manner as African Americans did in the postbellum southern states (Zimmerman 2010). This mission was especially problematic because of the entrenchment of unfree labor models in the southern Jim Crow agricultural system. The farms established required coercion of the local indigenous African population (German attitudes at the time argued that without coercion, the inherently indigent African would not work), and the resistance of indigenous Africans to the scheme resulted in the return of the Tuskegee farmers to America with little success.
The perceptions of slavery were influenced not only by attitudes of imperial nations such as the British but also by the world’s changing demographic situation. Economic migration, both forced and free, had been a feature of world history since ancient times, when entire small populations of subject peoples were moved around by marauding powers to suit their economic and strategic requirements. However, the changes in technology of transport and communication of the modern era resulted in mass movement of people. In the late nineteenth century, as now, the boundaries between forced and free migration were difficult to discern. With the ending of the forced migration of Africans through the transatlantic system and diplomatic efforts to prevent the forced movement of people in the Islamic World slave system, corrupt systems of convict transportation and later indentured servitude and blackbirding arose to fill the gap left by the chattel slave markets. For the United States, the presence of indentured servitude caused a conceptual problem: was this a system of enslavement, thus to be avowed and prevented, or rather was this a legitimate way for those in need of cheap labor to acquire it? The answer to that question depended on the political expediency of the time. For example, those intent on arguing that Chinese immigration to the United States was a negative force and would taint the country because “coolie” laborers were decidedly un-American, indentured servitude was a form of slavery which brought coerced, inferior laborers into the country. Denis Kearney, leader of the anti-Chinese labor movement in California in the 1870s, called Chinese laborers “cheap slaves.” Chinese, like African Americans, were “degraded” labor and not easily incorporated into the free labor ideology of the emancipation era (Aarim-Heriot 2003). However, for those, such as American settler colonists, who ran a profitable sugar industry in Hawaii who saw the necessity of a cheap labor force, indentured servitude offered a way of acquiring large numbers of workers. They were accused of coercive contract labor practices in their treatment of laborers from China, Japan, and Puerto Rico (Poblete 2014). These workers, recent arrivals from overseas, were often represented (and at times coerced) by their countrymen who assisted their arrival and settling in to their new homes, as in the East Coast padrone system. These patterns persist into the present day, with the line blurred between facilitation and coercion. The acceptability of certain labor forms was also determined by racial attitudes, with labor practices defined as acceptable when perpetrated by those not seen as racially challenging to the American populous. Thus, in the period after emancipation, American attitudes to slavery and forced labor continued to be defined by racial ideology.

Racism Evolving: Othering the Slave, Othering the Slave Owner

While it is true that the racial ideology justifying Atlantic world slavery was particularly virulent, in most forms of slavery in evidence around the world and across time, some othering of the victim takes place. This represents a continuum over the longue durée, but a postbellum change was that the racial rhetoric that othered the chattel slave was adapted to other those trapped in different coercive
labor situations. However, after emancipation, and with the United States consider-
ing its position as a global economic and strategic power, antislavery imperialism
also caused the development of a new type of rhetoric within the United States,
which othered the slave owner. This also built on a rhetorical continuum as, prior to
the Civil War, abolitionists had been vocal and strategic in their use of popular media
to alienate the slave owner from the mainstream of American society. Then slave
owners were accused of transgressing Christian norms of behavior or representing a
backward, almost feudal system out of kilter with the modern world. They were not
attacked on racial grounds because, of course, they represented a pillar of white
hegemonic power. What was new after emancipation was the way that racially
deterministic discourse was used to attack and alienate the slave owner in far distant
parts of the globe, especially in the Philippines, Hawaii, Africa, and the Middle East.

Racially othering the victims of abusive labor practices within the United States
and globally continued apace after the Civil War. As shown above, the Jim Crow
legal, extralegal, and social systems of control kept the black laboring population in
their place and for decades after emancipation bound them to corrupt and coercive
employers through convict labor and debt bondage systems. In some cases, such as
the citrus industry of central Florida, this persisted even until after World War II.
Systems of control had two main functions, to reinforce the hegemony of the white
population, including its poorer members, by teaching them about their superiority,
while at the same time preventing attempts by the African American population
through individual ambition or collective organization to improve their lives in situ
or by moving elsewhere.

This othering of the forced laborer was practiced by two types of perpetrator,
firstly those defending them as justified because of the nature of the laborers who
would not otherwise work hard because of their lazy or childlike natures. Second,
defenders of forced labor situations did so with the goal of maintaining social and
racial hierarchies, caring less about the economics of labor and more about threats to
society from integration and miscegenation. During the late nineteenth century,
theories of scientific racism that ranked ethnic groups according to innate abilities
and characteristics emerged from the academy and became commonplace through-
out American society. Developed from Charles Darwin’s theories (ironically Darwin
was an antislavery proponent), scientific racism was developed by important Amer-
ican theorists such as Louis Agassiz, who in the decade prior to the outbreak of the
Civil War photographically surveyed enslaved African Americans in South Carolina.
Agassiz was not a proslavery apologist, but he did believe that African Americans
were entirely differently descended to the white man (he was an adherent of the
theory of polygenesis), and, although he expressed sympathy for the plight of the
individuals that he encountered, he firmly believed that they were racially inferior.
This ranking resulted in the fear of higher-ranking races that dilution of their
bloodstock would result in weakening. These now distasteful racial views affected
all aspects of political, social, and economic policy, including attitudes toward and
controls of immigration, on urban development, on the improvement of health and
education provision, on attitudes to alcohol and other intoxicating substances, and on
views about labor systems.
Not all Americans at the turn of the twentieth century were disdainful toward racial mixing, and they challenged the predominance of racial determinism. African American thinkers such as W.E.B. Du Bois countered arguments about the natural inferiority of black people by pointing to advanced civilizations in Africa and the Middle East as well as challenging the static ideas of race that underpinned hierarchical systems. The anthropologist Franz Boas preferred to challenge social Darwinism with views sympathetic to the twenty-first-century understanding, suggesting that differences in attainment between the races were caused by cultural inequality and not by inherent racial difference. But in this period, their voices were often drowned out by the strength of adherents to racial determinism, whose ideologies in the United States impacted victims of forced labor.

Since the arrival in California of large numbers of Chinese immigrants, the rhetoric of racial difference was employed to keep this population in a socially and economically inferior position. After emancipation newspapers used both text and cartoon to suggest that many of the Chinese arriving on the West Coast were forced laborers, dismissively known as “coolies.” The indentured labor system that took many migrants out of China was indeed often corrupt, and traffickers made false promises to migrants heading to Hawaii and Peru as well as the United States. However, many of the Chinese settlers made the journey as free migrants, and being tarnished as forced laborers or even slaves was an attempt by conservative commentators to stir up resentment and prevent further migration. This partially succeeded as from 1888 onward, the Chinese were the first racial group to be systematically targeted by immigration control legislation. However, this law did not prevent the arrival of many migrants from China, and despite facing prejudice, within a generation many settlers successfully established themselves. This is an example of the racial othering of victims of forced labor but also of the mutability of definitions of forced labor. The concept of slavery is being used here as a weapon to prevent the arrival of those seen as racially undesirable. It is not being used to defend the victims of forced labor or to further national goals, even in a hypocritical and cynical way as imperialists sometimes did, but rather to defend the racial purity of the nation.

American strategic interests were furthered more successfully in some cases by othering the slave owner and slave trafficker rather than attacking the supposedly enslaved. Just as European empire builders did, by identifying the slave owner as racially inferior, Americans justified imperial intervention. In the Philippines, the United States entered the vacuum left by the collapsing Spanish empire and encountered a complicated system of racial hierarchy that looked unlike anything they had experienced in their contact with Native Americans and African Americans, although President Roosevelt did compare the hostile General Aguinaldo with Sitting Bull to justify US interference (Blount 1913). To rank the different ethnic and religious groups within the Philippine Islands, the Americans identified tribes which appeared more and less “advanced” in terms of clothing and other appearance markers but also used religion and slavery as ways to differentiate, identifying the “Moros” as “other” in two ways. Firstly, they were Muslims, and relatively recent immigrants to the islands, depicted as interlopers taking advantage of indigenous Philippine islanders. Americans, especially southerners, used this concept as a way
of delineating differences between enslaver and enslaved, so that Philippine prac-
tices more closely mirrored the type of slavery they were used to in the antebellum south (Salman 2001). And secondly, the Moros practiced slavery, seen as more suspicous because of their religion. Global slavery in the late nineteenth century was increasingly depicted as perpetrated by Muslims. The presence of this subversive population bent on corrupting the other Philippine tribal groups allowed imperialists to justify American involvement in the region.

Elsewhere, in parts of the world where the United States was more an inter-
ested observer than an active participant, Muslim slave owners and traders gained a notorious reputation. In the Middle East and East Africa, led by the British but copied by the Americans, slave trading was refashioned as a Muslim occupation, one that was promulgated by corrupt and greedy “Arabs” with its victims being vulnerable, backward Africans who needed military protection. This was despite the willingness of the British in East and Central Africa to negotiate with slave traders such as Tippu Tip for power. Muslim traders further east were also depicted as targeting white victims from regions such as Circassia. This “white slavery” attracted much newspaper attention in the United States, representing as it did the “world turned upside down” – the continued existence of slavery and one that subverted accepted racial norms. Again, the use of white slavery as a rhetorical tool to alienate the slave owner was not a new phenomenon but a continuity from before emancipation. During the Civil War, abolitionists had used extremely light-skinned enslaved children to promote their cause to waver-
ing northerners, with the message that the southern system of slavery was so corrupt that even white-looking children were caught up in it.

The white slavery of the late nineteenth century was a gendered phenomenon. Female Circassian slaves captured by Turks and taken into harems as sex slaves horrified and titillated American and British audiences, as visual representations of these scantily clad women, and their exoticized Arab captors, appeared in newspapers and high art and literature. From the late nineteenth century, the term “white slavery” also took on a new meaning becoming a synonym for sex trafficking and all forms of prostitution. First in Britain and later in the United States, white slavery panics took hold, with authors fearing that innocent girls and women were enslaved by traffickers often depicted as the racial other.

**Slavery: White Slavery and Gender – A New Phenomenon?**

Antislavery rhetoric from the late eighteenth and early nineteenth centuries often focused on the female victim and the abuses perpetrated on her body in an attempt to persuade the public of the true horror and moral corruption of the slave trade and the system of slavery itself. This model had its flaws as a persuasive tool, however, because the victims of the transatlantic system were black and, like poor white women, for many commentators these victims could not be considered part of the ideal of “true womanhood” that defined a protected and cosseted role for white, wealthy, and respectable women. As we have seen, abolitionists stretched
definitions of whiteness to proclaim as victims of white slavery those white-seeming light-skinned slaves paraded in the north to raise money for the cause. In the later nineteenth century, definitions of whiteness became yet more flexible, welcoming more ethnic groups into the fold. White slavery had local and global variants, encompassing types of slavery perpetrated by racial others far away, by exoticized perpetrators, and by sex trafficking to the United States, which also had strong overtones of the otherness of the trafficker and the whiteness, and sexual purity, of the victims.

Throughout history, Arab world slavery, with its aim of population growth and the spread of Islam, always had more focus on the female enslaved than did the Atlantic world system, whose goal was to furnish the strongest laborers. The position of enslaved women taken as concubines to the harems of the Middle East is a complex one, and some of those were able to achieve positions of immense political and economic power and were protected and highly valued. Others found themselves physically and sexually abused, used as little more than tools of procreation. The hidden polygamous world of the harem fascinated observers from Europe and the United States and from the early nineteenth century onward became a fashionable topic for artistic and literary representation, although fascination with the gentility and beauty of Circassian women had been present in Southern European and Middle Eastern culture since the early modern period. Various such scenes were depicted explicitly for titillation or as political attempts to label the Turkish or Arab heads of household as corrupt and cruel with their domestic arrangements as decidedly unchristian.

During the Civil War, Circassian women were displayed in the United States as part of P.T. Barnum’s show, tapping in to abolitionist concern about white women escaping a life of enslavement. However, in the 1870s when the issue caused a sensation in American newspapers, when news broke that white women and girls were still being kidnapped and enslaved as concubines in Ottoman harems, the racial othering took a new turn because not only did the race of the victim make her more sympathetic in the minds of an American newspaper audience, but now that the United States had emancipated its own slaves, it was easier for America’s people to distance themselves from the practice. While in the United States such slavery was represented as typical of the cruel Turk, throughout the nineteenth century, the Ottoman Empire attempted to suppress the slave trade in white women and girls, but the trade persisted partly because of the impoverishment of subject peoples like the Circassians who were willing to sell their children in the hope that, with one less mouth to feed at home, the enslaved child might have a better life elsewhere. Such complications in this type of sexual slavery did not frequently make the newspapers of the United States, which preferred to use the stories to further orientalist motives of othering and exoticizing the people of the region.

At the turn of the twentieth century, a more sustained white slavery panic, mirroring one in the British press, developed around the issue of sex trafficking to and within the United States. By labeling coerced prostitution (and in some cases, all prostitution) as white slavery, the press failed to acknowledge the diverse ethnic backgrounds of the women doing sex work and, also, reflecting debates continuing
into the twenty-first century, ignored the thorny problem that many sex workers undertook the job willingly. The white slavery panic is part of the progressive agenda to improve the moral hygiene of the American people by using the mechanisms of the state to change the behavior of those who were too weak or unwilling to change on their own (Leonard 2016). This agenda encompassed many types of reform including the treatment of disease and mental health and attitudes to alcohol and drugs. White slavery literature, novels, pamphlets, and newspaper accounts told stories of vulnerable women and girls who through naivete or greed were enticed into a life of prostitution by men and women depicted as the ethnic other (Donovan 2006). This enticement might involve the corruption of a city office girl, the tempting of a country girl to move to the city, or the international trafficking of women and girls to the United States. In white slavery discourse, the city itself was to blame as a site of corruption, but it was the specter of organized rings of traffickers led by French, Russian, or Jewish gang members that caused fear in the minds of readers. However, in 1910, an inquiry, with John D. Rockefeller junior as foreman, found evidence of no such organization.

Much of the white slavery literature was written by activists such as Frances Willard or Jane Addams working with female victims or by members of law enforcement such as Theodore Bingham or Clifford Roe and carried with it the ring of authority. However, this literature was also titillating for the reader, as the downfall of the young women was, for the time, graphically described in often highly melodramatic language. The coercion of the women was emphasized, and the use of the term “slavery” heightened the audience’s awareness of the nature of this victimhood. While protecting and defending vulnerable young girls was the aim of campaigners, to do so by emphasizing the whiteness of their skin renders their work problematic and factually incorrect, and the body of literature as a whole reflects a concern, not only with the victims of forced prostitution but with independent, single women as wage earners in an urban environment, without a master (their father or husband) to control them. As with the case of Chinese immigration, this is another example of the rhetoric of slavery being deployed to restrict the opportunities of the supposed victims of enslavement.

**Conclusion**

The period immediately after emancipation in the United States represents one of continuity and change of coming to terms with the psychic shock of the war itself and its consequence of the abolition of slavery. Formerly enslaved individuals found themselves trapped in forced labor situations as part of systematic tools of social and economic control. But in other ways, the abolitionist legacy that had defined slavery as un-American also affected the zeitgeist after emancipation. Combined with the antislavery imperialist agenda of Europe, this legacy encouraged Americans to see themselves as activists on the global stage, using opposition to slavery as one weapon in the expansionists’ arsenal. During this period the definition of slavery was expanded profoundly, evolving from an economic relationship defined by
chattel ownership to a term which encompassed many types of abusive and coercive labor. Thus, in this period, indentured servitude and prostitution, among other phenomena, were deliberately defined as “slavery” for the purposes of exclusion or control. As the mass global movement of people increased exponentially, defining aspects of that movement as slavery was a way of legally and rhetorically limiting it.

The racially deterministic theories emerging out of social Darwinism framed much of the discourse on enslavement and allowed the othering of both victim and perpetrator depending on which was most expedient for contemporaries. Writing that urged the United States to act against slavery referred to the hierarchy of races, suggesting either that slave traders and owners were inherently cruel and corrupt, and their childlike victims from backward races needed protection, or that their presence within US society was undesirable and they should be turned away, or that their victims deserved protection because their whiteness, and thus their superiority, added to the injustice of their enslavement. Writing that denied that particular labor practices counted as slavery both within the United States and globally also employed discourse about the hierarchy of races, arguing that the racial profile of the supposed victims ironically meant that they could not become modern free workers without coercion at this stage of their development. While there was some resistance to racial determinism around the discourse of slavery from both white and black thinkers, their voices often became lost as racist ideology was embedded in European and American writing emerging both from the intellectual elite and from the popular press. Prior to the Civil War, in the construction of the ideal victim of slavery, abolitionists used female slavery as a powerful rhetorical weapon, and this happened similarly after emancipation, when coupled with white victimhood, the discourse became a powerful reiteration of the era’s values of true womanhood. Therefore, while in the period after emancipation the domestic concepts of slavery and antislavery from antebellum rhetoric retained their power, these morphed into new forms as slavery as a concept itself expanded and as the United States grappled with its own position on the world stage as a former slave power and a new imperial one.

Abstract

During nineteenth century, when racialized chattel slavery in the United States was at its peak, a form of abolitionism known as the Underground Railroad emerged to challenge what had been firmly established in American society through what the author calls an unholy, unruly rule of law. This was slaveholder law, and it had evolved over several centuries – haphazardly at first, and as abolitionism began to take hold, out of desperation – to protect the interests of slaveholders at the expense of millions of enslaved African Americans.

The Underground Railroad was a clandestine, loosely organized network of men and women, black and white, who risked social censure, imprisonment, injury, and even death in their efforts to aid and abet thousands of fugitive slaves escaping from enforced bondage. Acts of slave-hunting, recapture, transportation, and re-enslavement of fugitive slaves – akin to what we know as illegal trafficking today – were then perfectly legal. By contrast, acts of assistance to people

escaping from bondage into freedom – akin to the work of human rights and anti-trafficking activists today – were illegal and hence incredibly risky for all concerned. Participants in the Underground Railroad therefore knowingly broke the rule of law through deliberate acts of civil disobedience, a collective act of resistance the like of which would not be seen in the United States for over 100 years.

Thus, the Underground Railroad turns our understanding of human trafficking, as well as our understanding of the rule of law, upside down.

**Introduction**

This chapter is in two parts. Part One provides the historical and legal context from which the American abolitionist movement and, specifically, the clandestine anti-slavery activist network that later became known as the Underground Railroad emerged. It explains what that network was up against – including a bulwark of federally sanctioned slaveholder law – and what it managed to accomplish, against all the odds.

It was a history that took many years to emerge. The need for secrecy, the lack of a centralized organizational structure, and the resulting dearth of contemporaneous accounts, letters, diaries, and scrapbooks meant that the first attempt at writing a comprehensive history of the Underground Railroad would not be made until 1898. Its compiler, Wilbur Siebert, relied primarily on reminiscences – both published and unpublished – of surviving abolitionists and their families, including the published memoirs of Samuel May (1869), Levi Coffin (1876), Laura Haviland (1881), and Calvin Fairbank (1890), as well as the earliest published accounts of the Underground Railroad’s operations in Pennsylvania (Still 1872; Smedley 1883). Siebert also drew on recollections from books, archived newspapers, personal letters, and diaries, as he freely acknowledged (Siebert 1898). However, the work of black abolitionists and the self-emancipatory efforts of enslaved African Americans and the friends and family members who assisted them were largely ignored by scholars until the publication of Larry Gara’s myth-busting book of 1961, *The Liberty Line* (Gara 1961).

A further problem for scholars of slavery and anti-slavery resistance was that the transcripts of over 2,000 interviews conducted with formerly enslaved African Americans during the late 1930s languished in the Library of Congress, largely unstudied, until the 1970s when they were finally collated and published. Those transcripts – part of the Federal Writers Project – are themselves somewhat problematic. In all but a few states, most of the interviewers were white, and all the interviewers – whether black or white – carried with them the authority of role. At a
time when racial prejudice was at its height, these factors would almost certainly have made a difference in the way former slaves responded (Yetman n.d.). Despite the methodological issues that were obvious even at the time, they remain among the few extant firsthand accounts of the lived experiences of slavery and, in a few instances, firsthand personal experiences of what it was like to travel via the Underground Railroad.

Catherine Clinton has called the lack of serious historical scholarship a regrettable form of “disremembering” (Clinton 2004). Perhaps it is only coincidence, but the renewal of scholarly interest in the history of slavery and anti-slavery resistance in the United States largely coincided with the civil rights movement of the 1960s and the emergence of black studies in American universities. Similarly, perhaps it is only coincidence that, with a few exceptions, the establishment of academic research centers specifically dedicated to slavery and anti-slavery resistance at Yale, Harvard, and other prestigious American universities largely coincided with the establishment of the National Park Service’s Network to Freedom program in the late 1990s, itself the result of a Congressional directive. This program was specifically set up to find ways of exploring and commemorating the Underground Railroad.

During the latter decades of the twentieth century, Underground Railroad scholarship established beyond doubt that, unusually for its time, its participants were racially integrated, its operators both black and white. The origins of the railroad metaphor to represent the many and various means and routes of escape remain a matter for speculation, but it is likely that it emerged with the growth of actual railroads in the mid-nineteenth century, when anti-slavery activism was at its peak (Bordewich 2005). For freedom-seekers and those who assisted them in their escape and flight, however, travelling via the Underground Railroad went far beyond metaphor: it was to journey toward full humanity, with all its rights, privileges, and responsibilities at a time when enslaved people were considered, in law, little better than beasts of burden (Du Bois 1903). Thus, the Underground Railroad turns our understanding of human trafficking and what is meant by the rule of law, upside down.

Part Two explores the problematic historical aftermaths of abolitionism after the end of the Civil War, when slavery was formally abolished and the need for the Underground Railroad evaporated. The ratification of three Constitutional amendments – providing for freedom from slavery, full citizenship, and the right to vote – appeared to signal the beginning of the end of injustice for African Americans. Yet worse was to come, as earlier slaveholder law mutated into something equally if not more dismissive and divisive. As Du Bois would later put it, the granting suffrage to blacks “ended a civil war by beginning a race feud” (Du Bois 1903). Known as Jim Crow, the deep-seated bias against blacks that had underpinned slaveholder law went on to distort the universality of rules of law grounded in the reciprocal recognition of a common humanity. It was a situation that ungrounded, and continues to unground, justice itself for millions of African Americans.

These troubling aftermaths also show why the Underground Railroad should be viewed not simply through the lens of history but through the lens of the ongoing struggle for human rights. Arguably, we could not enjoy the human rights that tend to be taken for granted today without the efforts of those individuals prepared
to stand up and defend those rights, and this has always taken considerable personal
courage, both then and now.

This chapter concludes by drawing parallels between illegal anti-slavery activism
then and legal anti-slavery and human rights activism today and connects yesterday’s
unfinished business with today’s persistent, if unintended, consequences.

Part 1: Yesterday

A Most “Peculiar Institution”: A Genealogy of Slaveholder Law

The first black people to be imported to the American colonies as involuntary
workers arrived on the shores of Virginia in 1619. Within little over a generation,
slave status had become hereditary. From 1662, in a departure from English common
law whereby the status of children traditionally followed the status of their fathers,
the law applicable in the colony of Virginia determined instead that the status of
children born to enslaved women would follow the status of their mothers, rather like
the laws governing the offspring of farm animals. This applied whether or not the
father was black or white, enslaved or free. Over the next two centuries slave law
gradually, if haphazardly – given its previous absence in English common law –
made it legal not only to control the labor of a person for a time-limited period, as in
the case of indentured service. Additions to slaveholder law would eventually make
it legal to own a person, as well as that person’s descendants, as one might own items
of property, and in perpetuity (Finkelman 2012).

The chances of an enslaved person being able to achieve his or her own freedom
by legal means, such as buying oneself, were extremely low and entirely subject to
the whim of the slaveholder. As for slaveholders, at times the law also made it
difficult and costly to manumit, or free, one’s own slaves. As early as 1691 Virginia’s
General Assembly passed a law requiring any newly freed slave to “leave the colony
within 6 months and the former master to pay for their trip,” which was a clear
disincentive to manumission for land-rich but cash-poor slaveholders (Rowe 2005).

Later legal developments meant that even if a slaveholder wanted to free his or
her slaves and could afford to do so, acts of manumission would require state
approval. For example, the 1723 Act Directing the Trial of Slaves, Committing
Capital Crimes; and for the More Effectual Punishing Conspiracies and Insurrec-
tion of Them; and for the Better Government of Negros, Mulattos, and Indians, Bond
or Free was passed in Virginia in response to rumors of slave insurrections and was
very precise: “No Negro, Mulatto, or Indian slaves shall be set free, upon any
pretence whatsoever, except for some meritorious services, to be adjudged and
allowed by the Governor and Council, for the time being.”

In due course, additional legislation would also prohibit blacks from testifying
against whites, which meant that for all intents and purposes, enslaved people would
not count as legal persons in law. This meant that they could not act as witnesses in
their own or others’ defense, regardless of the nature of crimes committed against
them, for instance, rape, physical cruelty, or torture (Finkelman 2012). The situation
was such that in 1791, John Wesley would write to William Wilberforce that “American slavery was the vilest that ever saw the sun” (Losurdo 2011).

The construction of this body of law had at first been haphazard and “after the fact,” with insecure theoretical underpinnings. As the result of a series of impromptu decisions, it did not sit comfortably with what is known as positive law, that is, law that has been posited presumably for the greater good. However, neither did it sit comfortably with the tenets of natural rights that had informed the Declaration of Independence. It fits better into what one might call situational law, in the sense that for each situation that presented itself as a problem, a decision was taken to resolve it by legislation (Davis 1975).

The problem was that racialized chattel slavery stood in stark contrast to the nation’s founding documents – the Declaration of Independence, the Constitution and its first ten amendments, known as the Bill of Rights. Slavery may have been described in the Declaration as an imposition of a tyrannical British monarch, but after independence and after the United Kingdom abolished slavery in its remaining colonies, slavery did not die a natural death in the United States, as the founding fathers might have hoped. Those hopes proved to be naïve at best. Despite concerns about the ethical and moral aspects of slavery that they themselves expressed, primarily in their private writings, slavery instead grew exponentially, particularly after the invention of the cotton gin in 1793 and the explosion in the demand for cheap labor. This led to a significant financial capital investment in unfreedom, in the perpetuation of slavery. As British historian George Bancroft would note when slavery was at its peak, nowhere in all the legislation of America was there “one single law which recognizes the rightfulness of slavery in the abstract” (Bancroft 1851). There was not an area within the United States, north or south, which did not in some way profit from slavery (Farrow et al. 2006).

After the cessation of the transatlantic slave trade in 1807, an enormously profitable internal slave market rapidly took its place. It is estimated that some 700,000 slaves were forcibly uprooted from their homes and families in upper-south slave states such as Virginia and Maryland and sent to the labor-hungry cotton fields of the Deep South (Tobin and Jones 2008).

Early photographs, plantation inventories, newspaper advertisements for the sale of slaves, and handbills offering rewards for their capture combine to illustrate the sheer banality and ordinariness of slavery in people’s everyday lives. Slavery had been institutionalized and systemized. It was indeed a “peculiar institution,” the euphemistic terminology of the day belying a curious reluctance to acknowledge in words what was openly and legally practiced.

That said, it was a system based on fear, as Dr. James McCune Smith, the black University of Glasgow educated physician, himself a former slave, so keenly observed. In 1843 he wrote from his New York City home: “The laws they enact in regard to us are positive proof that our oppressors are getting more and more convinced that we are men like themselves; for they enact just such laws as the experience of all History has shown to be necessary in order to hold men in slavery. Their opinion of our manhood, then, may be measured by the severity of their laws” (McCune Smith 2006).
To white slaveholders, the notion that blacks might eventually wish to be free was worrying enough, but the notion that they might want to – and did – escape and, at times, collectively rebel against their enslavement was deeply threatening (Aptheker 1943). In Southern Virginia, in 1831 a slave insurrection involving some 60 fugitive slaves, organized by Nat Turner, resulted in the deaths of dozens of whites. The Nat Turner rebellion, as it became known, terrified slaveholders as never before. This is partly because Nat Turner was known to be literate. He was thought to have been influenced by the inflammatory writings of black abolitionist David Walker, whose *Appeal in Four Articles* claimed that despite being “subjected to the most wretched condition on earth, yet that spirit and feeling which constitute the creature, man, can never be entirely erased from his breast... The whites... are afraid that we, being men, and not brutes, will retaliate...” (Walker 1829).

By the early 1830s, in response to the inflammatory writings of both black and white abolitionists and as a way of limiting access to any information that might inspire further rebellion, slaveholder law also prohibited the teaching of slaves. In today’s parlance, one might say that slaveholder law was a desperate attempt to contain risk. Risk containment in this context worked in two ways: to restrict and control the growing black population and to enclose and protect from interference the interests of slaveholders. The 1857 *Dred Scott v. Sandford* case established that slavery could be expanded into territories where previously it had been barred and, significantly, stipulated that black people – including *free* blacks – were not and could never be citizens and thus had no legal standing in court.

As for slavery itself, black abolitionist David Walker presented it as a moral evil (Walker 1829). It represented a moral contradiction, as the ownership of other human beings stood in sharp contrast to the spirit of the Enlightenment, which regarded the tendency to define and treat other people as physical objects morally repugnant – at least in the abstract (Davis 2014). Furthermore, different states had different laws relating to enslavement and manumission, reflecting the tensions between states’ rights and federal authority that had characterized American politics since the country’s founding. Those laws could be chopped and changed, enhanced or diminished in impact, and exceptions made according to the personal and financial interests of the most influential politicians and lawmakers of the day, many of whom were slaveholders. It is for these reasons that slaveholder law can be called both unholy and unruly.

The point of providing a genealogy of slaveholder law is to demonstrate that, despite its unruliness, its emergence as the prevailing law of the land was not simply an accident. Rather, it was the result of a series of deliberate, conscious legal decisions, taken as situations arose. Nowhere in the world was chattel slavery – the form of slavery that treats people as items of property – so unequivocally racially constructed, so prolonged, and so comprehensively supported and legitimized by the law of the land as in the United States where, as it was boldly claimed in 1776, all men were created equal. Furthermore, it stood in sharp contrast to long-established principles of what is known as the rule of law, that is, that no one is above the law and that the law must be applied fairly to all those who are subject to it. Its effectiveness, and indeed its very existence, depends on the reciprocity of
expectations and trust in one’s fellow citizens to respect those same principles and, by implication, to obey the law (Bingham 2010).

Among slaveholding peers, this notion of reciprocity may have been present, but enslaved people – regarded as objects in law, not as persons – had no such expectations, and hence there could be no reciprocity. Why would enslaved people put their trust in the very laws that had legitimized their enslavement?

**Enter the Underground Railroad**

The Underground Railroad was a loose, clandestine network of thousands of African Americans – both enslaved and free – and their white allies, who were motivated to work together for the express purpose of assisting enslaved people out of bondage. Fergus Bordewich described them like this: “Except for their beards and bonnets they might be us, except for one great and dramatic difference. For a few hours each week or month, they burst the bonds of their ordinariness, taking risks that we can scarcely imagine. They became radicals, lawbreakers, trespassing the dangerous boundaries of race, and undertaking sacrifices that make us wonder if we would do the same” (Bordewich 2005), a challenge that continues to resonate today. Their work was underpinned by a racial, religious, and political radicalism that preceded the better known civil rights movement of the 1960s by over 100 years.

For the most part, this radicalism manifested itself as nothing more and nothing less than simple acts of hospitality: giving food, providing or arranging shelter and clothing, loaning or giving a little money if they had it to spare, ferrying fugitive slaves across a river or lake, and pointing the way or perhaps escorting a person to the next “safe” farm or settlement. What made it such dangerous work is that from the late 1700s onward, none of these seemingly ordinary activities could be undertaken without risk of an entirely different kind: the risk of social ostracism, financial penalty, imprisonment, physical injury, or even death (Still 1872; Bordewich 2005).

These risks were exacerbated by two Fugitive Slave Acts, the first of which in 1793 made it illegal to aid or abet fugitive slaves. The second, in 1850, also criminalized the refusal to assist federal officials in the recapture of fugitive slaves. The penalties were harsh: those who were caught were subjected to heavy fines or imprisonment or both. The very language of the Fugitive Slave Acts attempted to “brand” those who defied them. The word “fugitive” conjures up images of people on the run from the threat of arrest, prosecution, or conviction for the crimes they have committed, in other words, running away from justice. Although enslaved African Americans were running away, it was from the injustice of chattel slavery, toward justice, that is, toward a place where they could claim their rights as human beings. Today, they would be regarded as refugees or asylum seekers. The paradox is that they were indeed running from the law. Regarded as chattel property, they had stolen themselves (Hartman 1997). So it was that justice and the law meant different things.

Most abolitionists did not seek to break the law. Since the movement’s earliest days, its adherents sought primarily to work within the law in an attempt to change it,
through writing, publishing, campaigning, giving public lectures, petitioning, running for public office, and supporting those who did. These activities were not without risks of their own. The history of American abolitionism, informed by memoires of those most involved in the movement, is peppered with examples of printing presses being destroyed, homes vandalized, tarring and feathering, social ostracism, name-calling and other forms of harassment, physical injury, and imprisonment (Siebert 1898; Jeffreys 2008). By contrast, the radicalism displayed by participants of the Underground Railroad rested on the fact that helping fugitive slaves meant committing oneself to the active, conscious defiance of the law. It meant being a deliberate law breaker.

The illegal nature of Underground Railroad activities meant that secrecy was crucial, particularly where its black participants were concerned as the law afforded them little if any protection, even within the free states. Because of this, it was deemed safest if Underground Railroad participants had little if any knowledge of goings-on beyond their immediate locale, with contacts often limited to sympathizers in the next settlement or farm. Ironically, their very activities were often camouflaged by a coded language of commodity: those involved were called “conductors,” “agents,” and “stationmasters,” while fleeing slaves were often referred to as “goods,” “parcels,” “shipments,” and “deliveries” (Siebert 1898).

Although the participants in the Underground Railroad were already criminalized, they persisted regardless. As can be seen elsewhere in this volume, today’s highly profitable but illegal traffic in human beings depends on luring free but vulnerable people, often through deception or fraud, into bondage (International Labor Office 2014; Walk Free Foundation 2014). The Underground Railroad example turns that notion of trafficking upside down, as it involved assisting already-enslaved people who, by their own volition, were escaping from bondage toward the hope of freedom. This was grassroots anti-slavery activism writ large, and it explains why the Underground Railroad’s activities can be regarded as “reverse-trafficking.”

As it happened, the 1850 Fugitive Slave Act backfired spectacularly. It galvanized anti-slavery sentiments and sympathies and spurred abolitionist action to new heights in cities and towns throughout the northern states.

After slavery was legally abolished after the end of the Civil War, the Underground Railroad as a network ceased to have a function. Its activities, having been shrouded in secrecy, soon became the stuff of myth and legend. Its best known people such as Harriet Tubman – known as the Moses of her people – would become the subject of fictionalized treatments and the stuff of children’s story books.

As for abolitionism in the wider sense, its success was perhaps debatable. Slavery had indeed been officially abolished in law, so in that sense abolitionism was successful. In terms of numbers, Tom Calarco estimates that through the combined efforts of the Underground Railroad participants, perhaps as many as 100,000 African Americans were assisted (Calarco 2008). However, in terms of the material conditions of millions of former slaves, the fight for racial equality had been seen by many abolitionists as a separate issue and that battle had not yet been won. Although after the Civil War many abolitionists devoted their energies toward other kinds of progressive social reform, few of them – few of the white abolitionists, that
is – carried on the fight for racial equality with the same intensity and determination that had characterized their fight against the institution of slavery (Jeffrey 2008).

**Part 2: Aftermaths – Sidestepping Blame**

**Sidestepping Blame**

The word “aftermath” has two meanings. The first and best known refers to a consequence – especially the consequence of a disaster or misfortune, or the period of time following such a disaster. However, its other meaning has been all but forgotten. Aftermath (from the Old English word *maeth*, meaning “a mowing”) also means the second crop of grass from land that has already been mowed. After the havoc and devastation of the Civil War, what kind of aftermath would emerge in the peace that should have followed? What kind of crop could grow from the deep taproots of slavery, roots that the northern victors thought had been severed for once and for all by the horrors of the Civil War and the passage of Constitutional amendments guaranteeing the civil and political rights of black Americans?

What happened was this: the premature end of a short-lived postwar reconstruction program gave way to more virulent, overt forms of racism that quickly took enslavement’s place. Such overt racism was supported by pseudoscientific notions of white supremacy, which rapidly took hold not only among former slaveholders but among noted academics of the day, as well as the vast majority of white southerners who had *never* owned slaves. It was buttressed by oppressive state and local laws, collectively known as Jim Crow (Woodward 1957), and by the sheer terror and trauma of widespread lynching (Equal Justice Initiative 2015b).

In due course, slavery itself would be regarded as an embarrassment, something to forget, for the United States to “get over.” Although race relations remained volatile, slavery itself was considered a thing of the past. It was time to close the door on it, time to move on, and time for national recovery.

Recovery was a longtime coming and, as some argue, it has still not been fully achieved. One of the first to state this view was the Harvard-educated black sociologist Dr. W. E. B. Du Bois, who in 1935 stated “The price of the disaster of slavery and civil war was the necessity of . . . overthrowing a slave economy and establishing upon it an industry primarily for the profit of the workers. It was this price which in the end America refused to pay and today suffers for that refusal” (Du Bois 1935).

In 2009, over 150 years after the end of the Civil War, the House of Representatives and the Senate issued separate resolutions offering apologies for slavery and Jim Crow. These are, respectively, H. Res. 194, July 19, 2008, and S. Con. Res. 26, June 19, 2009. The House resolution “expresses its commitment to rectify the lingering consequences of the misdeeds committed against African Americans under slavery and Jim Crow and to stop the occurrence of human rights violations in the future.” By contrast, the Senate resolution stops short of saying that the government of the United States should commit itself to these aims. Instead, it calls on “the people of the United States to work toward eliminating racial
prejudices, injustices, and discrimination from society.” The entire onus for this endeavor – and by implication, the blame for any lingering injustice – is placed squarely on “the people,” that is, everyone and no one. Neither of the resolutions make reference to the ongoing benefits that so many people, mainly well-to-do whites, accrued as a direct result of slavery, Jim Crow, and decades of ongoing racial discrimination. Furthermore, the Senate resolution makes no connection between slavery and Jim Crow and human rights violations, either past or present. Nor does it provide any scope, or indeed hope, for any type of future financial settlement or reparations. In any case, the two resolutions were never amalgamated or signed by the President, and thus they did not carry the weight of a formal state apology.

This, however, should not be surprising. A little over a decade earlier, the 1998 Congressional Act that established the National Park Service’s National Underground Railroad Network to Freedom program – formed to commemorate and interpret the Underground Railroad – made some astounding claims: “The Underground Railroad, which flourished from the end of the eighteenth century to the end of the Civil War, was one of the most significant expressions of the American civil rights movement during its evolution over more than three centuries” and “The Underground Railroad bridged the divides of race, religion, sectional differences, and nationality; spanned State lines and international borders; and joined the American ideals of liberty and freedom expressed in the Declaration of Independence and the Constitution to the extraordinary actions of the ordinary men and women working in common purpose to free a people.” Later sections of the Act refer to the Underground Railroad’s “relevance in fostering the spirit of racial harmony and national recognition.”

These claims are astounding because they made no reference whatsoever to the role of the Constitution in legitimizing slavery or the then-illegality of the Underground Railroad’s activities. Nor did they make reference to the years of legitimized racial segregation, oppression, and public lynchings or to the mass incarceration of disproportionately high numbers of black Americans that started soon after the Civil War (Blackmon 2012) and which today is still going on (Alexander 2010; Salaka 2014). The claims also failed to mention that the Civil Rights Act of 1875 – the last civil rights bill to be signed into law until 1957 – was declared unconstitutional in 1883 by the United States Supreme Court. This deplorable judgment, together with the notorious Plessy v Ferguson “separate-but-equal” case of 1896, made it possible for harsh, repressive Jim Crow laws to take root and flourish throughout the post-Reconstruction period, continuing until the 1960s. Therefore, the implication that the American civil rights movement “evolved” over three centuries, as though it had taken place seamlessly, without interruption and without resistance, was grossly misleading.

In the years immediately following the end of World War II, organizations campaigning for equality for African Americans such as the National Association for the Advancement of Colored People (the NAACP) recognized that mere civil rights – that is, the legal and political rights afforded by the post-Civil War Constitutional amendments – would achieve little in terms of affording equality of
opportunity. They decided that only the broader remit of *human* rights would have the language and philosophical power to address the education, health, housing, and economic inequalities that African Americans had endured for so long (Anderson 2003). The tragedy is that although the United States had been a driving force behind the creation of the United Nations and the drafting of the Universal Declaration of Human Rights, it was an unwilling signatory to the Declaration, endorsing it only after reassurances that the Declaration would have no legal force (Blackburn 2011).

The relationship between civil rights and human rights soon became even more complicated. During the McCarthy era of the 1950s, the very notion of human rights and the United Nations “became synonymous with the Kremlin and the Soviet-led subversion of American democracy.” In other words, the fight for racial equality as a human rights issue would be branded as *un-American*. This forced the NAACP to retreat to the more narrow vision of civil rights, a retreat that had lasting repercussions on the lives of many African Americans (Anderson 2003). It also exposed the rhetorical emptiness behind the United States’ much vaunted claim to have entered the World Wars to help “make the world safe for democracy.” There are echoes here of the emptiness of the Declaration of Independence’s claim that all men were created equal, the assertion of self-evidence having been found wanting by the fact of slavery.

**The Problem with Heroes**

It is important to stress that the courage and tenacity of the people of the Underground Railroad are not in question here. Many of them put their very lives on the line in order to support and assist fugitive slaves in their escape to freedom. Its participants – both black and white – suffered not only social censure but physical injury, imprisonment, torture, and even death as a direct result of their actions. The problem is that despite the care and attention that twenty-first century scholars are taking to examine the tensions between freedom and unfreedom and exposing the contradictions referred to earlier, the National Park Service’s Network to Freedom program may – perhaps unintentionally – be obscuring the collective national responsibility for America’s slaveholding past and its lingering aftermaths. It seems to be casting a mantle of moral goodness over that unholy, unruly past, personified by the people of the Underground Railroad. After all, why would the general public not want to identify with those who risked their lives in the cause of others’ freedom? With people now perceived as national heroes?

The current focus on uncovering the stories of the Underground Railroad’s “heroes,” and the glossing-over of slavery’s taproots deep in American history, could together result in diverting attention from those seldom-examined aspects of the American psyche that enabled slavery and Jim Crow to prevail for so long. There are grounds for these concerns within the Southern Poverty Law Center’s (SPLC) 2014 report on the state of modern civil rights teaching in the United States. The report states that there is only minimal mention of slavery and its integral part in US history. More surprisingly, however, mention of slavery barely featured in the
SPLC’s scoring criteria (Southern Poverty Law Center 2014). This is difficult to understand because the centuries-old histories of American slavery and Jim Crow, together with their awful, unresolved aftermatts, are precisely why there needed to be a modern civil rights movement in the first place. Today, the interlinked struggles for racial equality, racial justice, and – as can be seen in this volume – the abolition of modern-day slavery remain incomplete.

There is an understandable reluctance to associate law with slaveholding and indeed to associate the proverbial law-abiding citizen of today with the slaveholding lawmakers of American history, including its revered founders. George Washington is remembered as the father of the country, not as the Virginia planter who failed to manumit a single slave during his lifetime. Thomas Jefferson is remembered as the man who drafted the Declaration of Independence, not as the Virginia planter who wrote that blacks were inferior to whites in mind and body (Jefferson 1787) and who fathered several children by one of his female slaves. America’s slaveholding past is thus seen as an unfortunate stain on its history that many people would prefer to forget (Levy 2005).

What seems to be at work here is a kind of moral torpor that Meister likens to *acedia*, originally a monastic term that referred to the slowness to perform penitential tasks (Meister 2011). In other words, a person – or country – might have issued an apology for having done something, or having failed to do something, but has not taken the necessary next step of making amends for whatever deed prompted the need for the apology in the first place. As mentioned earlier, a formal state apology – the first step in the process – is still awaited.

At national level, this kind of abstraction translates into the presence of a blind spot: it is the inability to recognize that disadvantage is not the fault of disadvantaged people themselves. Rather, it is the result of decades of systemic, institutional failure. The blind spot stems from an unwillingness to recognize or perceive – especially in a country that prides itself on progress – that failure has happened at all. This unwillingness to acknowledge failure, to anticipate its possibility, or to plan for it is coupled with a stubborn reluctance to go beyond making an apology which, despite its symbolic value, makes no difference to people’s material circumstances. It also smacks of what Ignatieff refers to as American “exceptionalism,” that is, the application of double standards. On the one hand, in the mid-twentieth century, the United States displayed exceptional leadership in promoting human rights standards in other countries. On the other hand it resisted, and continues to resist, complying with those same human rights standards at home, failing also to align its foreign policy with those standards (Ignatieff 2005).

This combination of factors can result in the distrust of law itself. Unless people are able to believe that if they act in accordance with the law they will be protected by it and to trust that those who are charged with implementing the law do so fairly and equitably, then the rule of law as we understand it today is under threat.

Related to this concern is that the valorization of those who successfully escaped their bondage, and those who assisted them in their escapes, casts on them a mantle of eliteness (Hartman 1997). It fails to acknowledge the courage and resilience of those millions of enslaved people who did not or could not escape, including those
who repeatedly “stole away” without having permanently gained their freedom. It is exactly this kind of determined moral courage that is required if one is to continue resisting the worst effects of psychological trauma of enslavement against all the odds and to maintain one’s dignity as a human being, in the face of every inconceivable indignity day after day, year after year (Kauffman 2002). It is exactly this kind of courage that today largely goes unmentioned, unnoticed, uncelebrated, and unsung.

**In Conclusion: Discomforting Parallels and Unintended Consequences**

Unlike the activists of the Underground Railroad, the anti-slavery human rights activists of today are supported in their work by a range of internationally ratified United Nations declarations, conventions, and resolutions, including a specific Declaration on Human Rights Defenders (The full title of this declaration is the *Declaration on the Right and Responsibility of Individuals, Groups and Organs of Society to Promote and Protect Universally Recognised Human Rights and Fundamental Freedoms*, adopted by United Nations General Assembly Resolution 53/144, December 09, 1998). Despite the law now being on their side, this is cold comfort if an activist is arbitrarily thrown into prison with no access to a lawyer. The risks that today’s activists face are in fact little changed from those faced by nineteenth-century anti-slavery abolitionists, working in defiance of that unholy, unruly rule of slaveholder law. Evidence comes from Margaret Sekaggya, until 2014 the special rapporteur on human rights defenders, and her report on the situation of these courageous men and women. According to her report, human rights defenders have been subjected to “killings, attacks, disappearance, abduction, torture, and [other forms of] ill-treatment,” sometimes involving “the abusive use of legal frameworks against them and the criminalization of their work.” Much of this harm is perpetrated by “State actors, including Government officials, State security forces and the judiciary” (Sekaggya 2011). The same concerns are echoed in her successor Michael Forst’s report of December 2014.

Today’s anti-slavery activists also face methods of harassment and intimidation unimaginable to the activists of the Underground Railroad. As well as the risks to life and limb already mentioned, they are also faced with tirades of shocking verbal abuse and death threats delivered directly to their computers, tablets, and mobile phones, the anonymous perpetrators out of sight in the dark corners of the Internet.

As for civil rights activism within the United States, the Equal Justice Initiative has reported a worrying trend: since the election of the United States’ first black president in 2008, there has been an increase in resistance to civil rights and an increase in anti-civil rights rhetoric in America. This suggests that “many anti-civil rights activists have seized the narrative that racial justice is no longer a legitimate social goal,” going so far as to say that such efforts are “actually anti-white measures that promote inequality” (Equal Justice Initiative 2015a). This is not confined to rhetoric: the Southern Poverty Law Center reports an exponential growth in the
number of extremist, racist hate groups springing up across the United States. It is hard
not to conclude that decades of hard-won progress are gradually being chipped away.

This is an uncomfortable question to ask, but could it be that ostensibly “color-
blind” “post-racial” criminal justice policies are no more “color-blind” or “post-
racial” or indeed “unintentional” than the earlier slaveholder and Jim Crow laws
were? Could they be symptomatic of a new, increasingly overt version of white
supremacy which, until relatively recently, dared not speak its name? Tim Wise
thinks so: he refers to the election of President Obama as a “shape-shifting of racism”
which is making it more difficult than ever to address ongoing racial bias in the
United States (Wise 2010).

The Equal Justice Initiative has attempted to turn the tide on growing racial hostility
through a local, Alabama-based project that places commemorative roadside markers
at the sites of lynchings and slave markets. Their project aims to help break the silence
to which so many incidents of historical violence are consigned and, ideally, to open
the door to constructive dialogue, by which that hard-won progress can continue.
These examples of grass-roots activism contrast sharply with policy at national level,
where there seems instead to be a tendency to close off such dialogue. This indicates
the rejection of the notion that racism is, or ever has been, a problem.

Hopefully, the Equal Justice Initiative’s roadside markers will be allowed to tell
their stories, and hopefully they will escape the fate of the plaque identifying the
home of noted Underground Railroad operator the Reverend John Rankin and his
family. The plaque, typical of those marking historic sites, states that Rankin’s home
served as an Underground Railroad station from 1828 to 1863. Unusually, Reverend
Rankin made no secret of his anti-slavery activities. His home in Ripley, Ohio, was
situated high on a bluff overlooking the Ohio River. He regularly lit a beacon that
shone its light across to the slave state of Kentucky, serving as both an open
invitation to fugitives and a visible gesture of defiance to slaveholders, and slave-
holder law.

The plaque marking the Rankin family’s home, however, gives cause for exactly
the above-mentioned concerns. A photograph of the plaque published in 2008
revealed that it had been perforated by some 43 bullet holes (Marc 2008).

## Abstract

The chapter focuses on the emergence of international legislation against trafficking in the early twentieth century, focusing on the years between 1904 and 1949. The chapter will introduce key legal measures adopted during that time but focus on the enactment of the International Agreement for the Suppression of the “White Slave Traffic” 1904 and the International Convention for the Suppression of the White Slave Traffic 1910. These measures, unlike modern anti-trafficking legal standards that recognize more comprehensive forms of exploitation, focused solely on recruitment for prostitution and the exploitation of prostitution. The chapter argues that the early-twentieth-century legal framework was mostly a result of civil society action in the field and that the framework enabled the control of immigration and emigration of young women. The chapter will further show how the terminology changed from “white slavery” to a more neutral “traffic” with the League of Nations. Despite this change, immigration

Introduction

This chapter discusses the emergence of international law against trafficking from the early twentieth century to 1949 when the first UN convention against trafficking was enacted. In the early twentieth century, the terms “traffic” and “white slavery” were used interchangeably. This chapter uses mainly the term “white slavery” when talking about the phenomenon before the 1921 International Convention to Combat the Traffic in Women and Children and the term “traffic” afterward, for historical accuracy. While there are many distinct features about the early antiwhite slavery accords that will be discussed throughout the chapter, an important distinction needs to be drawn with the early accords and present-day legal standards. The early accords focused solely on exploitation in prostitution, while the more modern ones aim at fighting against trafficking in persons as connected with multiple forms of exploitation.

The chapter analyzes the early documents in chronological order to show the development of international law in the field. The chapter argues that the first international accords were introduced and enforced by civil society organizations, and hence understanding the cooperation between civil society organizations and state bodies is paramount in order to understand the anti-trafficking framework and legal standards more broadly. It further argues that the new accords enabled the control and restriction of women’s migration.

The period the chapter focuses upon was marked by divisions between different civil society organizations, mainly the women’s rights and vigilance ones, on the role and potential of law. The discussions on trafficking at the turn of the century and the language of the first accords also reveal highly polarized and at times repressive views on gender, sexuality, and migration. To analyze these tensions, the chapter will draw extensively from the archival collections of the International Bureau for the Suppression of the White Slave Traffic (International Bureau) and other organizations such as the International Abolitionist Federation. These archives hold records of meetings, conference papers, and drafts of international conventions. They also hold, for example, the first definition of trafficking in international law, which can be found in the minutes of the International Congress of the International Bureau in London in 1899.

The chapter begins by discussing background on the civil society organizations active at the time, before discussing the accords they created, namely, the International Agreement for the Suppression of the “White Slave Traffic” (1904 Agreement) and the International Convention for the Suppression of the White Slave Traffic 1910 (the 1910 Convention). It then focuses on the League of Nations’ action
in the field, both concerning legislative activity and the work of the League’s Traffic in Women and Children Committee. The final part of the chapter provides brief reflections on League of Nations and United Nations Conventions from 1921 to 1949 to demonstrate that there was a shift toward abolitionism, particularly in the aftermath of the Second World War.

The Vigilance Movement and the Origins of White Slavery Accords

In 1904, the first anti-trafficking international legislation, the International Agreement for the Suppression of the “White Slave Traffic” (1904 Agreement), came into force in the 22 participating states. The International Bureau and its then Secretary, WA Coote, were accredited by fellow civil society organizations with bringing about the Agreement and launching the first international measures against white slavery (More about International Bureau for the Suppression of the White Slave Traffic here http://www.lonsea.de/pub/org/192). Coote was praised in particular for his relentless campaigning in Europe against the white slave trade and for establishing the first international framework against white slavery. Praising Coote for the drafting of the 1904 Agreement, Gregory Maurice said the securing of the 1904 Agreement was the climax of the movement. He called Coote’s work and the remarkable manner in which he had brought the Agreement about one of the great romances of philanthropy.

The International Bureau, the organization at the heart of the accords, stemmed from a well-known British Christian vigilance organization, the National Vigilance Association (NVA). In Britain, the NVA was the dominant vigilance organization working to eradicate all forms of vice. The association was simultaneously lobbying for new criminal and immigration legislation to tackle a perceived rise in white slavery and to limit the number of foreign women working in prostitution (Lammasniemi 2017b). In the late nineteenth century, NVA became increasingly aware of the international aspects of white slavery and concerned over female emigration from and immigration into Britain. To cooperate with European counterparts more effectively and to raise awareness of white slavery on an international scale, the NVA established an international arm, the International Bureau.

The International Bureau quickly expanded both in membership and regarding countries within which it operated. Despite this, it remained rooted in the British vigilance movement. While the International Bureau had national committees worldwide, in its early years, the same personnel populated the British National Committee and the International Bureau’s highest body, the Congress of the International Bureau. Furthermore, those personnel were drawn from NVA members. The General Secretaries of the International Bureau, WA Coote and later FAR Sempkins, had also served initially as leaders of the NVA. The strong connection – both ideologically and pragmatically – between the British vigilance movement and the International Bureau is therefore undeniable.

It should be noted here that the International Bureau was not the only organization working in the field, but it was undoubtedly the most influential. Perhaps the best
known of the other organizations in the field is the International Abolitionist Federation, established by Josephine Butler in 1875. Both the International Bureau and the International Abolitionist Federation shared concern over vice and prostitution, but their definition and understanding of prostitution, and later white slavery, differed significantly. The International Abolitionist Federation was part of the women’s movement of the era, and they viewed the white slave trade as a women’s rights issue. For them, the figure of the prostitute became a vehicle to address all the inequalities and social wrongs against women (de Vries 2008). This is different from the International Bureau, which in their rhetoric made a distinction between the “innocent white slave” and “criminal prostitute.”

The organizations also had very different approaches toward the state. The International Abolitionist Federation advocated “anti-regulation abolitionism” and was against all forms of regulation of prostitution. The International Abolitionist Federation used the term “abolitionism” to describe their work against the state regulation of prostitution; however, this chapter uses the term “anti-regulation abolitionism/abolitionists” in order to distinguish it from the modern discourse whereby term “abolitionism” is used to describe attempts to abolish and prohibit prostitution.

Perhaps the most crucial difference between the International Abolitionist Federation and the International Bureau is that the International Abolitionist Federation viewed state regulation of prostitution as a way to control and degrade those working in prostitution and so their rhetoric is characterized by a deep distrust in the state. In turn, the International Bureau focused on the abolition of prostitution and vice often through regulation and cooperation with national police and officials, as we will see from the next part of the chapter.

**International Agreement for the Suppression of the “White Slave Traffic” and Its Enforcement**

The London Conference of the International Bureau in 1899 set in motion the drafting of international accords against white slavery. The 1899 conference and other International Congress conferences were organized by the International Bureau but were attended by the representatives from the leading moral-purity, abolitionist, and anti-regulationist groups, including the International Abolitionist Federation. These organizations could vote and propose resolutions; for example, the International Abolitionist Movement repeatedly and unsuccessfully tried to file a motion to abolish the regulation system in continental Europe.

In the first International Congress in 1899, an essential Resolution was adopted by the Congress that there should be an agreement between governments to tackle white slavery. The Resolution called for the criminalization of procurement of women and girls into prostitution as well as the establishment of international criminal investigations where white slave traffic was suspected. In addition, the Resolution called for further formal cooperation between civil society organizations who were to share, for example, “information as to the emigration of women under
suspicious circumstances.” It also called for each country’s delegates to collate a list of active associations in their countries who can fulfil roles in “protecting migrants” and to provide relevant state bodies in their respective countries with this list.

The resolution itself is striking or telling. It shows that the International Bureau intended to focus on law reform campaigning in the international arena mainly and as such embraced and sought cooperation with the states in which they operated. Their claim to international lawmaking and lobbying is particularly notable as the international law concerning specific transnational crimes was still rare.

One of the critical aspects of the Resolution was its clear focus on border control; the Resolution envisaged that charitable and civil society organizations would take on the role of monitoring borders and female migrants. Before the Agreement came into force, the national committees of the International Bureau were already engaged in this task, without formal agreements with the state (Limoncelli 2010). The national committees monitored and reported back to the central International Bureau on levels of suspected traffic and prostitution through patrolling railway stations and ports where they greeted girls whom they suspected of being a white slave, or indeed a foreign prostitute. While the most oppressive aspects of the white slavery agreement, such as repatriation of foreign prostitutes, were not part of the early resolutions, even prior to the ratification of the 1904 Agreement, the national committees provided funds for the repatriation of foreign prostitutes and campaigned for their compulsory repatriation (International Congress 1899–1904). The port control remained an essential part of the International Bureau’s work even after the First World War when the League of Nations took over the enforcement of international legislation. Cities such as Buenos Aires, which were considered particularly sinful, were monitored closely, and all women who arrived in third-class coaches were interviewed on arrival as late as the 1930s by a member of the Argentinean National Committee to ascertain the purpose of their visit (Sempkins 1928).

The 1904 Agreement followed the Resolution set out by the International Bureau in 1899 to an extent. Importantly, it did not make provisions for the criminalization of procurement or create an offense of trafficking. Instead, the Agreement created some administrative measures and focused on repatriation of foreign women suspected of being prostitutes. The Agreement primarily made administrative provisions that aimed to enable cooperation between participating states by establishing central bureaus for the exchange of information and by sharing information regarding relevant domestic convictions.

The Agreement did little to create provisions for the protection of women but instead created a complete system for investigation and repatriation of foreign women suspected of prostitution. Under Article 2 of the Agreement, the member states were required to set up patrols at ports and railway stations to identify foreign women and girls who might be prostitutes. The port patrols focused their attention on foreign, working-class women and girls and interrogated them “judiciously to ascertain for what purpose they [have] come and where they intend staying” (Coote 1910).

Those who were identified as foreign prostitutes, or at risk of falling victim to white slavery, could be questioned under Article 3 to establish their identity and
nationality in order to provide for their repatriation to their country of origin. The provisions within the Agreement were enacted to target women and girls of a particular class and appearance in order to identify potential prostitutes at the entry points to the countries.

At the 1903 Conference on the Suppression of the White Slave Traffic, the NVA reported disappointment with the attempts to engage with, and repatriate, prostitutes and wrote that they did not have much luck in their operation in British ports. NVA officials said they had spoken to hundreds of foreign girls offering to “repatriate them, put them in touch with a lady in their respective countries, and to give them a’ fresh start in life, not one accepted our offer of help” (Vigilance Record 1903). The girls had instead, much to the disappointment of the patrols, “announced their intention of staying here until they are turned out” of the country (ibid.).

The level of cooperation with other organizations and implementation of the assistance provisions varied greatly between different countries. For instance, the Spanish National Committee reported having offered 20 asylum places to the more than 200 women they had stopped between the years of 1904 and 1906. The British National Committee made no such provision and instead allocated their funds to the repatriation of foreign prostitutes (International Congress 1906).

The International Convention for the Suppression of the White Slave Traffic 1910

The Agreement was followed in 1910 by the International Convention for the Suppression of the White Slave Traffic, ratified by the majority of European countries and which built on the existing Agreement (1910 Convention). In a notable divergence from the Agreement, the 1910 Convention created a basis for criminal prosecution for those suspected of being in breach of the Convention, thereby creating the first international definition for the offense of trafficking. Article 1 of the 1910 Convention states:

> Whoever, in order to gratify the passions of another person, has procured, enticed, or led away, even with the consent, a woman or girl under age, for immoral purposes, shall be punished, notwithstanding that the various acts constituting the offence may have been committed in different countries.

The complex definition under Article 1 of the 1910 Convention included the three elements of trafficking often identified today: the act, the means, and the purpose. Furthermore, it dispensed with the consent of the victim if an element of coercion or deceit was present even for women over the age of 21. Notably, in the absence of coercion or deceit, Article 1 only applied to girls of 21 years of age and younger as defined in an additional protocol. The Final Protocol defines the age limit with Articles 1–2 as 21 and below; however, it allows states to make their legislation on age limit and provisions against procuring women of any age, provided they be applied equally to all. The following Articles guided internal implementation and created provisions for the nation-states to create similar criminal offenses.
in domestic law. Article 3 obliges the member states to create an equivalent punishable offense in domestic law, and Articles 5–6 provide for extradition procedures. The International Abolitionist Federation argued against the age limit and for outlawing all forms of procurement but were defeated in their aims (Doezema 2010). The victim of white slavery was always represented as someone innocent, young, and naïve; the age limit of 21 can be seen as reflective of that representation.

De-racializing the White Slave Trade: The League of Nations’ Action on Trafficking

The concepts of nationality and race in all their complexities were constructed and utilized differently by various organizations in the field but were integral to the 1904 Agreement and the 1910 Convention. Women’s rights organizations advocated abolitionist policies across racial and national lines, stopped using the term “white slavery” at the start of the century in official correspondence, and instead adopted the term “traffic.” In 1910, the White Slavery Committee of the International Council of Women officially changed its name and terminology from white slavery into “traffic in women” (Abolitionist Federation, 3AMS/E/01-02). The International Bureau, however, resisted the name change from the “International Bureau for the Suppression of the White Slave Trade” into “Suppression of Trafficking.” There were numerous proposals “to include women of all races and colours” in the remit of their operation, but the International Bureau rejected these proposals and claimed the time was not right. Beyond the refusal to acknowledge the trade in nonwhite women, the nationalism ran deep within the organization.

Race was both explicit and implied in the white slavery discourse. In the legal context, biological and nationalistic aspects of “whiteness” were highlighted as the international white slavery accords did not apply in most colonies. Most countries had entered reservations on the agreements’ applicability in the colonies so women from colonies could not be “white slaves” for the law (Limoncelli 2010; Legg 2009, 2012b, 2013).

It would be wrong, however, to state that whiteness was only construed in biological and explicit terms in the discourse. The term “whiteness” was rooted beyond race, in class, nationality, and perceived purity. Many of the vigilance campaigners viewed prostitution as demeaning and de-whitening. For example, in campaigning materials such as the NVA book In the Grip of the White Slave Trader (1911), stories of English prostitutes who had nonwhite clients or boyfriends were told with particular horror and disdain. The whiteness in the white slavery discourse was more than a term of biology; it was a way to determine purity.

Officially, the term “white slavery” was replaced with racially neutral “traffic” in international law and in terms of the International Bureau’s action only in 1921, when the League of Nations took over the regulation and passed the 1921 International Convention to Combat the Traffic in Women and Children (International Bureau, 4/NVA S107-134).
According to Article 23(c) of the League of Nations Covenant, the League was to have “general supervision over the execution of all agreements with regard to the traffic in women and children,” but no general guidelines were issued as to how this consolidation was to take place or what the specific powers of the League of Nations were. The main function of the 1921 Convention was to amplify and strengthen the 1904 Agreement and the 1910 Convention discussed in the previous section (ibid). Replacing the loaded term “white slavery” with the more neutral term “traffic” marks a shift to a more nuanced understanding of trafficking, and as Stephen Legg has argued, the League of Nations thereby played a key role in “de-racializing the ‘white slave trade’ rhetoric” (Legg 2012b).

The League of Nations also established the Traffic in Women and Children Committee of League Nations (the Committee) (see Hengley 2010). The Committee conferences became the main forum for debating issues around trafficking in the international sphere. Although the Committee had no legislative power, it advised the League Assembly and was able to propose legislation and reforms to the Assembly (Pliley 2010). From the minutes of the Committee meetings and debates, it became evident that state parties were promoting their interests, often shaped by the postwar sentiment of nationalism.

The early years of the League of Nations’ work on trafficking were marred by oppressive proposals from the member states that were often aimed at controlling immigration of women suspected of prostitution. Limoncelli (2010) has argued that the era after the establishment of the League of Nations was marked by attempts to nationalize prostitution – in contrast to prewar white slavery agreements that aimed at international cooperation to curtail it. After the war, xenophobia had reached its peak, and this is also evident in the League of Nations’ action in the field of trafficking. Measures were taken at international level and, in member countries under the premise of “traffic in women,” were primarily aimed at restricting the movement of women rather than protecting women. Exploitation of female migrants, working in prostitution or not, was rarely addressed as anti-immigration agenda took center stage. There were moderate voices and women’s rights voices, but these organizations did not have the same platform that they did before the war. The International Abolitionist Federation (3AMS/E/05-06) was still calling for protection and putting forward resolutions for the abolition of state-regulated brothels, but these were refuted one by one.

While the Traffic in Women and Children Committee was established to tackle trafficking in women, from the beginning, prohibitionist and nationalistic voices dominated the Committee. Already in the second session of the Traffic in Women and Children Committee in 1923, Poland put forward a proposal for the prohibition of foreign-born women in state-regulated brothels (Traffic in Women Committee 1931). The proposal was heavily supported by the International Bureau and some Christian civil society organizations but opposed by France and women’s rights organizations. In the words of Avril de Sainte-Croix, “the proposal, which was so contrary to feminine dignity, had so many practical objections that it was worthless” (Limoncelli 2010, p. 80).

Paulina Luisi, Uruguay’s State Representative and pioneer for women’s rights in Uruguay, highlighted the irrationality of such a proposal as it would give powers of
deportation arising from an activity that is not a crime in the first place. She vigorously contested the proposal on the grounds that it was nothing more than “nationalizing prostitution” (Traffic in Women and Children Committee 1932). The much-debated proposal was, however, a way to push more restrictive policies into the agenda. The prohibition of foreign women in state-regulated brothels was approved, and, shortly afterward, a proposal was made for the compulsory expatriation of foreign prostitutes. This became another hotly debated issue and one that kept returning to the Committee, despite being defeated in the first debates.

The compulsory repatriation proposal had the backing of the International Bureau, who had a prominent position within the Committee. Although the proposal was again defeated, the International Bureau continued to advocate for the repatriation of foreign-born prostitutes in the years to come. Still, in the annual conference in 1930, it passed a resolution urging the governments not to delay “the repatriation of women who are leading a life of prostitution” and called for penalties for all women who return after repatriation (International Bureau 1930). The International Bureau (1930) furthermore advocated for more restrictive immigration policies and, in memoranda submitted to the Committee for discussion, included a proposal to ban entry of working-class foreign women to other member states:

considering that the importance of attainment and prevention of a high standard of morality overrides any objection to action being taken against any particular class of either sex.

The proposal was vigorously contested by many, including de Sainte-Croix, who argued that “illegal and exceptional measures cannot form the basis of a high standard of morality” (ibid). Luisi furthermore argued that not only would the Bureau’s proposal do nothing to fight traffic, but it would also seriously infringe the freedom of travel for all women (Traffic in Women and Children Committee 1932).

Jessica Pliley (2010) has argued that in the early years of the League of Nations, anti-regulation abolitionist feminists influenced the League of Nations’ agenda. However, after influential feminists such as Dame Rachel Crowdy resigned from their posts toward the end of the 1920s, feminist voices were muted, and policies became ever more paternalistic (Pliley 2010). Already in 1925, after the debate on compulsory repatriation of foreign-born prostitutes in the Traffic in Women and Children Committee, Paulina Luisi, critical of the direction of the Committee, “wondered whether the task of the Committee was to defend the society against prostitutes” (League of Nations 1925).

**International Law After 1921: Toward Abolitionism**

The 1921 League of Nations Convention was followed by further League of Nations anti-trafficking conventions in 1933 and 1937. These conventions pushed the international law in a more abolitionist direction by dispensing with consent, but they were not groundbreaking legal documents. The final international Convention in the field, until the Palermo Protocol, was the 1949 United Nations Convention for
the Suppression of the Traffic in Women and Exploitation of the Prostitution of Others. The 1949 Convention took an abolitionist position, in its preamble, stating:

trafficking and the accompanying evil of the traffic in persons for prostitution are incompatible with the dignity and worth of the human persons and endanger the welfare of the individual, the family, and the community.

Under Article 1, traffic is defined in the Convention as procuring, enticing, leading away, “for prostitution, another person, even with the consent of that person.” Subsequent Articles outlaw managing brothels and renting a property for prostitution. The 1949 Convention, therefore, construes trafficking far more broadly than the early documents and enshrines an abolitionist position.

The 1949 Convention was enacted in the aftermath of the Second World War and the abolitionism within must be viewed within this complex context. During the First World War, exceptional measures were adopted in countries such as Great Britain to deal with the perceived threat of prostitution, and associated venereal disease, that it posed to national security, the health of families, and the moral fiber of communities (Lammasniemi 2017a). Many of these measures were repeated during the Second World War; and the Convention must be viewed in the postwar, anti-prostitution climate (Doezema 2010, p. 112). While the 1949 Convention notes a radical departure from existing international law by a de facto requirement for signatories to criminalize prostitution in their domestic law, the Convention proved too controversial. Most countries never ratified the Convention, and so it had little impact (Limoncelli 2010, p. 11).

Conclusion

The international accords of 1904 and 1910 were paradoxical; they were passed under women’s rights rhetoric, yet no real provisions for the assistance of women were made. Furthermore, they were deeply conflicted concerning legal standards. While all the White Slave Traffic Agreements and Conventions focused on the recruitment and transportation of women for immoral purposes and the issue of prostitution, prostitution itself was considered a matter of national jurisdiction.

The white slavery accords are essential for some reasons. Firstly, they demonstrate the formalization of the role of the vigilance and charitable organizations. Secondly, they were necessary for creating measures to control the migration of women where none existed previously. The agreements created a complex administrative system that allowed the vigilance associations – in their new official function – to monitor points of entry into the country, to interrogate foreign women they suspected were prostitutes, and ultimately to deport them. The private lives of women who were suspected of prostitution were subjected to monitoring and surveillance, and many faced deportation from the countries they had emigrated to. The agreements can, therefore, be seen not only in the context of a rise in international law but also in the context of a rise in immigration regulation.

Traffic in Women and Children Committee: Repatriation of foreign prostitutes by Dr Paulina Luisi (1 April 1932) NA HO45/15041.
The trafficking of children has received extensive attention from both academic and political arenas in recent years, yet this growing phenomenon remains a relatively new area of international law (Gallagher, The international law of human trafficking, Cambridge University Press, 2010). Human trafficking has both a long legal and political history, distinguishing it from many contemporary international legal issues (Gallagher, The international law of human trafficking, Cambridge University Press, 2010). Despite this history the term “trafficking” was not defined by international law until the adoption of the Optional Protocol to the UN Convention against Transnational Organized Crime, the Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children in 2000.
This chapter will illustrate the origins of child trafficking within international law and identify an evolution in understanding of the phenomenon over the course of the last century. Through research in the League of Nations archives, Geneva, this chapter illustrates how a historical perspective enhances understanding of contemporary legal responses to child trafficking. The chapter undertakes a critical analysis of child trafficking within the context of international law, demonstrating the parallels with the White Slavery Conventions of the early twentieth century and the contemporary legal framework.

**Introduction**

The Optional Protocol to the UN Convention against Transnational Organized Crime, the Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children (hereafter, the Trafficking Protocol), established the first international legal definition of human trafficking through Article 3 (Gallagher 2010). However, human trafficking has both a long legal and political history, distinguishing it from many contemporary international legal issues (Gallagher 2010).

This chapter demonstrates the origins of what is today classed as child trafficking, specifically charting the development of the international legal regulation of child trafficking and the international legal architecture that has been implemented over the last century to tackle the phenomenon. The analysis examines the emergence of child trafficking within the legislative sphere of the League of Nations (LoN) through the twenty-first-century legislation of the United Nations (UN).

This chapter draws comparisons between the contemporary legal framework and their historical counterparts. While the ideological parallels between contemporary human trafficking and historical fears of “white slavery” of women and girls have been critiqued (Doezema 2010; Limoncelli 2010), this chapter charts the ideological, discursive, and legal developments, contextualized by a comprehensive overview and analysis of the legal origins of child trafficking within the international legal framework through the utilization of research within the League of Nations archives, Geneva (Lammasniemi 2017: 65).

To understand the legal structure implemented, the chapter will address the issues of what constitutes childhood and children’s rights, before the analysis divides into two distinct sections. The first section addresses the emergence of child trafficking in the early twentieth century and during the era of the League of Nations (1919–1946). The rise of awareness of child trafficking is identified through engagement with policy and regulation of the phenomenon through the “White Slavery Conventions” of the early twentieth century and the legislative sphere of the League of Nations. The analysis focuses primarily upon the International Convention to Suppress the
Traffic in Women and Children 1921 and references made in the Summary of Annual Reports 1927 and 1928.

The second section of the chapter addresses child trafficking and the United Nations (1945–present day) through a critique and comparison of the contemporary legal framework, that is, the Convention on the Rights of the Child 1989 (CRC), the Optional Protocol on the sale of children 2000 (OPSC), and the Trafficking Protocol 2000.

The chapter is thus not limited purely upon the legal regulation of child trafficking but engages with the ideological, discursive, legal, and policy developments to tackle the phenomenon over the course of a century.

**Childhood and Children’s Rights**

Preceding an analysis of the historical origins of the international law of child trafficking, it is essential to address the concepts of childhood and children’s rights. The concept of childhood is an interdisciplinary one, drawing upon historical, psychological, sociological, and social policy perspectives (Buck 2014, Chap. 1: Childhood and Children’s Rights, pp. 1–39). This chapter critiques the implementation of international law to eradicate child trafficking; therefore the overview provided will refer predominately to the international legal development of the child and childhood.

The definition of children is intrinsically linked with the development of the powerful protectionist discourse that continues to surround children today. Prior to the creation of the current international legal system, the League of Nations (1919–1946) was an integral feature of the international legal order in the early twentieth century. The League demonstrated an interest in children, particularly in protecting and providing welfare services for children (Buck 2014). The League created a Committee for the Protection of Children in 1919 and adopted the Declaration on the Rights of the Child in 1924. (The Geneva Declaration of the Rights of the Child was adopted 26 September 1924.) Although not legally binding, the Declaration exemplifies how the children were constructed as a passive object of concern, rather than as an active subject capable of asserting their own rights against others. The paternalistic nature of the Declaration is clear and provides a stark contrast to the central ethos of the Convention on the Rights of the Child 1989 (hereafter, the CRC) that sought to recognize children as autonomous.

It has been asserted that a critical source of vulnerability for children originates from their lack of agency, both in fact and under law (Gallagher 2010, 284). The legal definition of a child is enshrined by Article 1 of the CRC as “a child means every human being below the age of 18 years unless the law applicable to the child, majority is attained earlier.” The CRC filled a void, providing an international agreement upon the definition of childhood. However, the concept of childhood is contested by some, with the African Union recently explicitly enshrining a higher standard through the African Children’s Charter, within which childhood is extended to 18 without any references to the age of majority. (Article 2: Definition of the child. http://www.achpr.org/instruments/child/. Accessed May 2018.)
The Historical Origins of Child Trafficking

The significance of the “White Slave Traffic” is twofold; firstly, it provides the origins of both the societal perception of “human trafficking” and the contemporary legal definition (Allain 2017). Secondly, it provides an insight into how fears of the sexual slavery of women and children manifested in the adoption of several international agreements. This chapter will locate the origins of these fears, through the League of Nations archives, examining the ideological, discursive, and legal developments of child trafficking, rather than addressing the issues of their effects.

The Trafficking of Children: The Twentieth Century and the Era of the League of Nations

The International Legal Regulation of “White Slavery”

The chapter will focus primarily upon the Suppression of the Traffic in Women and Children 1921 and will not address the 1933 Convention as it excludes children from its parameters, focusing on “women of full age.” The 1921 Convention sought to intensify and reinforce the 1904 agreement and 1910 convention, after representatives of 34 nations met in Geneva to determine the extent of compliance with the 2 treaties (Knepper 2013). It is assumed that the “White Slave Traffic” Conventions of 1904 and 1910 were not developed with the intention of excluding children from their reach, but prima facie the primary issue was the traffic of “white slaves.” The explicit reference to “white slaves” limits the application to white children only, providing a clear distinction between those deemed worthy of protection and those
who are not. Both the 1904 and 1910 Conventions refer specifically within the Articles to girls, notably excluding men and boys from their reach. (1904 Convention term girl/s used eight times, 1910 Convention used seven times.) The 1904 Convention, for instance, references girl(s) on eight occasions, while the 1910 Convention makes seven references. The 1921 Convention, by comparison, provides no direct references to girls or boys but refers only to children. The 1921 Convention explicitly mentions children on five occasions through Articles 2, 6, and 7, reflecting a significant shift toward inclusiveness, capturing all children regardless of age, class, gender, race, and ethnicity.

The term “White Slave Traffic” is objectionable for several of reasons (Allain 2017), most notably for the implicit racism afforded through the exclusion of non-whites. However, the instruments remain crucial to understanding emerging fears of “the traffic” generally. Concerns about the “white slave trade” rested upon the fear or assumption that vulnerable and naive women and young girls were tricked or kidnapped to then be forced into prostitution. These “white slavery” narratives often involved the abduction of European women for prostitution in Africa, South America, or the “Orient” by “foreigners” (Kempadoo et al. 2012). Within the Summary of Annual Reports from member states, colonies, possessions, protectorates, and mandated territories on the “traffic in women and children” to the Secretariat of the League of Nations in 1927, explicit references to “European Children” by the Gilbert and Ellice Islands (British Protectorate) and the “traffic of European children” by Cochin China (French Colony) can be found. These references exemplify the implied focus upon the race of children identified as trafficked or exploited for immoral purposes. Moreover, this provides evidence to support the perspective that the issue of race was both explicit and implied in the “white slavery” narrative (Lammasniemi 2017). The 1921 Convention reflected a palpable shift from the racially motivated language of its predecessors and specifically identified “women and children” in its title rather than “white slaves.”

The Trafficking of Children and the League of Nations

International Conference on Traffic in Women and Children 1921

Into the League of Nations era, the International Conference on Traffic in Women and Children 1921 (hereafter, the Conference) had a specific agenda: to eradicate the traffic of women and children for the purposes of sexual exploitation. The Conference primarily focused upon administration and organization, through establishing the Rules of Procedure, the Appointment of Committee of Organization, and a report on the replies received to a Questionnaire that addressed the “traffic of women and children.” The Conference records illustrate that the phrase “white slaves” was replaced by references to “women,” with the delegate from Great Britain recommending that the word “white” should be omitted from the title of International Agreements. (Conference on Traffic in Women and Children, Daily Bulletin No III. July 2, 1923, third meeting 10 am. WIN_20180301_14_54_58_Pro.jpg.) This shift was justified as it was deemed more “exact and adequate,” providing
clarification that “it is, of course, only a change in form.” (League of Nations Records of the International Conference on Traffic in Women and Children (meetings held from June 30 to July 5, 1921), Geneva 11.) The phrase “traffic in women and children” was therefore adopted to replace “white slave traffic” within international documents (Knepper 2013). This shift was institutionalized by the publication of a worldwide trafficking study in 1927 commissioned by the League. This global inquiry into the traffic of women proved to be controversial, and the subsequent report contained significant distortions (Knepper 2013). Although an important enquiry, the Report of the Special Body of Experts on the Traffic in Women established the conceptual language for the study of international crime throughout the twentieth century (Knepper 2013). It falls outside of the scope of this chapter due to the focus of the inquiry upon women.

The Conference is noteworthy due to the explicit reference to the “Traffic in Children.” Whether this shift in language reflects a genuine departure in focus away from the dramatic narrative of “white slavery” (Doezema 2010) within legal, political, and societal arenas is subject to debate. The justification for the inclusion of “Traffic in Children” was that it was deemed necessary, in light of the “new and terrible facts” about the trafficking of children that were revealed by the Congresses held in Brussels, 1912, and London, 1913 (Ibid.). Furthermore, the conference proceedings stipulate that “in this respect, also, the time has come for protective action” (Ibid.). The Conference clearly demonstrates concerns and subsequent action that arose in response to the Congresses held in both Brussels and London, indicative of the Eurocentric focus and moral concerns fueling the development of instruments to address the exploitation of women and children for immoral purposes.

The Conference also raised a link between the traffic of women and children and the trade in indecent or obscene publications, through the identification of an intrinsic link between the two, with obscene publications perceived as a driving force behind trafficking of women and children (Ibid.: 28). This link is one of three identified linkages or explanations for the growth of child trafficking established by the activities of the League at the time. The second link is between the legal age of marriage and child trafficking, with the third attributing links between the traffic in opium and child trafficking. Each of these linkages will be addressed separately in the first part of this chapter, with the impact and legacy of these links to be explored in the second section that addresses contemporary child trafficking.

An outcome of the Conference was a meeting held to specifically address “child traffic” with international measures to control the traffic, especially within colonies and dependencies of states referred to (Ibid.: 1). The Vice President of the Committee asserted that child trafficking “is a very large and difficult question, perhaps more difficult than it would at first seem,” advocating the creation of a Committee to report back to the conference (Ibid.: 72). This demonstrates a shift away from the rhetoric of “white slavery” and falls into line with the League of Nations broader concerns of protecting children. This shift could be attributed to the realities of the world after the Great War, which led to a growing recognition of the perceived vulnerabilities and subsequent need to protect children. However, this growing desire to protect children was not inclusive enough to afford equal levels of protection to all children, regardless of their class, gender, and race.
The International Convention for the Suppression of Traffic in Women and Children 1921

The 1921 Convention was signed on September 20, 1920, in Geneva by 33 states, 22 of which did not belong to the League of Nations. (Albania, Australia, Austria, Belgium, Brazil, British Empire, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Estonia, Germany, Greece, Hungary, India, Italy, Japan, Latvia, Lithuania, Netherlands, New Zealand, Norway, Persia, Poland and Danzig, Portugal, Romania, Siam, Union of South Africa, Sweden and Switzerland. League of Nations (1922: 6).) Of the four conventions passed between 1904 and 1933, only the International Convention for the Suppression of the Traffic in Women and Children 1921 specifically mentioned children within the title. The significance of this is not purely superficial but reflective of the period. As demonstrated above, the 1921 Convention signaled a shift from the preambles of the 1904 and 1910 Conventions and can therefore be seen to provide a demarcation from the perception that trafficking only involves white women and girls. The impact that this conceptual shift had upon children will now be analyzed.

The significance of the 1921 Convention with regard to children is twofold. Firstly, Article 2 states that:

> The High Contracting Parties agree to take all measures to discover and prosecute persons who are engaged in the traffic in children of both sexes.

The Convention thus adopts a broad and inclusive approach to the “traffic in children,” acknowledging that any child can be trafficked, regardless of class, gender, and race. However, as will be detailed later in this chapter, these significant interwoven issues were largely absent in responses to questionnaires in the annual reports on the “traffic in women and children.” Secondly, Article 5 raised the age limit of protection from 20 to “21 completed years of age.” (Article 5 International Convention for the Suppression of the Traffic in Women and Children 1921.) This increase is explained by reference to the protection of the morality of young girls and fears of “wanton men” (Kempadoo et al. 2012). The anti-slavery accord had an age limit for seduction set at 21, implying that protection is strongest for girls than women. Despite this increase by Article 5, reservations were submitted by states such as Burma, India, the Italian Colonies, Iraq, and Thailand. All five submitted reservations only to Article 5, with both Burma and India stipulating that the age of 16 was preferable. Iraq and Thailand did not specify a different age within the context of Article 5, simply submitting a reservation. The reservations of both the Italian Colonies and Thailand explicitly stated that the reservation was only applicable to a specific section of society, namely, “native women” of the Italian Colonies and “nationals of Thailand.” These reservations based upon race and ethnicity provide an insight into how unequal levels of protection were afforded to nonwhite populations, indicating that “native” or “indigenous” populations were explicitly considered of lesser value. This rhetoric is a continuance of the “White Slavery” Conventions, and, regardless of the explicit move toward the inclusivity of all women and children by the 1921 Convention, the application of law and policy in certain states was determined by race.
The full extent of the impact of these reservations upon the ideology and policies adhered to within each of the identified state parties is yet to be uncovered. However, the Summary of Reports of 1927 Questionnaire responses, from Burma and Iraq, provide revealing insights. Burma advocated that “no system of adopting, pawning or bartering of children for immoral purposes exists,” while Iraq stipulated that “no special measures [are] considered necessary, police throughout country as part of normal functions protect children from exploitation” (League of Nations 1929).

The League of Nations identified a link between the legal age of marriage and the traffic of children (Committee 1928: 5). In 1928, the Traffic in Women and Children Committee and the Child Welfare Committee consulted the “experts’ report” and replies from governments and concluded that “fixing the age of consent and the age of marriage at too early an age is apt to encourage the traffic and to promote the corruption of the young” (Ibid.: 6). The morally laden, protectionist ideology is clear. However, even with good intentions, unintentional damage, such as unequal access to rights or protection based upon the race, class, and gender of children, can be a consequence.

The specific reference to marriage and trafficking demonstrates the wider concerns that trafficking did not manifest only as the “White Slave Conventions” would suggest. The Traffic in Women and Children Committee and the Child Welfare Committee both classified child trafficking within a broader conceptual framework than the legacy of the “White Slave Trade” allows. The Committees recognized the exclusiveness of the “white slavery” and adopted a more expansive umbrella of the “traffic in women and children.”

The wording of Article 6 implies that exploitation outside of the state of origin was considered more serious. Article 6 prescribes that the contracting parties have regulations “as are required to ensure the protection of women and children seeking employment in another country.” It is unclear why regulations to protect women and children are deemed more important when the employment is outside of their native state. Protective mechanisms should be deemed as important regardless of where a child or adolescent is seeking employment; however, there is a clear assumption that those who are perceived as vulnerable, such as children, should not migrate.

**The League of Nations Registry Files 1919–1927**
The League of Nations Registry files 1919–1927 (12/114/114 12/647/647 12/35389/647636) demonstrate that child trafficking was not a primary concern at the time and that the focus upon prostitution remained paramount. This is illustrated by the 1927 inquiry conducted by the League, which focused purely upon the traffic of women for prostitution, noting that “no complete figures [are] available, but reliable information obtained...justifies the belief that a traffic of considerable dimensions is being carried on” (confirm reference pp. 355–356). The inquiry was the first worldwide study (Material was gathered from 28 countries across Europe, the Mediterranean, the America but no Scandinavia. See further Paul Knepper (2013).) of human trafficking, distorted by the fact that researchers used a definition of “traffic in women” to suit the policy-making agenda of the era (Knepper 2013). That agenda embodied the eradication of prostitution and endorsed the idea of
protection and rescue. The focus remained primarily upon the “White Slave Traffic/Trade” (see further Knepper, P. International Crime in the 20th Century: The League of Nations Era, 1919–1939, 2011). The issue that arises is whether this observation differs from the reports afforded by the religious and charitable organizations that are presented to the Committee for Traffic in Women and Children.

Specific references to “child trafficking” within the Summary of Annual Reports upon the Traffic in Women and Children from 1927 and 1928 are entirely absent. This lack of specific references to child trafficking as a standalone issue demonstrates that considerations of child trafficking lacked a strong evidential base. This further highlights the interwoven nature of the phenomenon of trafficking with other issues of humanitarian concern. The below table demonstrates the lack of explicit references to child trafficking within the non-digitized League of Nations Registry Files (Table 1).

The primary focus is clearly upon “White Slave Traffic” or the “Traffic of women and children,” with the former references on 29 occasions and the latter 23. Moreover, 16 references to “White Slave Traffic/Trade” are identified in 1920 alone, with 8 in the following year, highlighting that the preoccupation with “white slavery” peaked in 1920. Prior to the adoption of the 1921 Convention, which moved away from the language of “white slaves” to focus upon the “traffic of women and children.” The overwhelming emphasis upon the traffic of women and girls for immoral purposes is indicative that fears of sexual slavery remained a constant companion to the development of trafficking as an international issue of concern. Merging women and children into a category of vulnerability infantilizes women and amplifies the idea that those who are classified as vulnerable should not migrate (Sanghera 2012).

The files further identify a link between the trafficking of women and children and the trafficking of opium, further evidencing that the phenomenon of child trafficking was, at the time of the “White Slavery Conventions,” not a primary issue of concern. As detailed above, the trafficking of women and children was often linked or attributed to three issues: the traffic in obscene publications, the legal age of marriage, and the traffic in opium, together forming a powerful conceptual paradigm of protectionism, morality, and criminality.

Traffic in Women and Children Summary of Annual Reports 1927 and 1928: State Responses to Question 8

The Summary of Annual Reports of 1927 and 1928 have been selected for focus here as 1927 marked the 5th year since the 1921 Convention entered into force and preceded the outcome of the League’s 1927 inquiry into trafficking. The reports contain several questions, with Question 8 alone explicitly addressing children:

In addition to any information given in reply to previous questions, please state whether any other measures have been taken to protect children from exploitation for immoral purposes, especially where any system of adopting, pawning or bartering of children exists.

The question focuses upon protecting children from exploitation for immoral purposes, explicitly referring to systems of adopting, pawning, or bartering of children. The question fails to articulate the sale of children, attempting to include this under the umbrella-like term “pawning or bartering.” The focus is upon immoral purposes, whether that be for prostitution or sexual exploitation through child pornography or “obscene publications.” The phrase “exploitation for immoral purposes” is indicative of the need to classify harms or identify specific types of exploitation that are worse than others.

There are several notable responses to Question 8, the most revealing being from the French Colony of Cochin China and the British state of Siam. Within the Summary of Annual Reports for 1927 prepared for the Secretariat, it was stated that within Cochin China (French Colony from 1862 to 1954), the traffic of European children is unknown within the colony; however there are Chinese organizations in operation that recruit native women, girls, and boys for clandestine shipping to China (League of Nations 1929: 23). The response further stipulated that the girls were sold for the purposes of prostitution, while boys on the other hand were sold to childless families (League of Nations 1929: 26). The language adopted draws a clear distinction between native women, girls, and boys and “European children,” with the latter afforded higher levels of protection by the international community.

Siam asserted that no additional measures were taken for the protection of children; however police discovered four separate cases in 1927 of four Chinese boys stolen in China and brought to Siam to be sold (League of Nations 1929: 25). The purpose for which those boys were to be sold is omitted from the report, and no further elaboration is provided. The reason why a child had been taken or the exploitation that was suffered appears to be less important than the issue of illegal movement across national borders. These two examples provide a revealing insight into what would later evolve to be known as “child trafficking.” Both examples identify children of both genders trafficked across national borders for distinct reasons. Both responses highlighted that the traffic of “European children” was not an issue, identifying scenarios of child trafficking that fell outside the traditional parameters of “white sexual slavery.” The responses indicate that the focus upon “white slave traffic” or the loss of innocence of adolescent girls deflected from recognition of boys who were trafficked not for the exploitation of immoral purposes. The primary focus remained on young, white girls trafficked to be morally
corrupted. Another significant inclusion is the specific reference to “Chinese organizations,” implying organized criminal activity and providing justification for increased criminal justice mechanisms such as increases in police, law, and involvement of the courts.

The Trafficking of Children and the United Nations

The issue of child trafficking has received increasing attention in recent years. This chapter has demonstrated the historical foundations of the issue through a critique of the policy and legal regulation adopted by the League of Nations. The focus of the second part of this chapter now considers child trafficking in the age of the United Nations (UN), identifying parallels between contemporary and historical responses.

The position of children within the current international legal framework can be located through instruments such as the UN Convention on the Rights of the Child and its three Optional Protocols: the Optional Protocol on Children in Armed Conflict (OPAC), the Optional Protocol on the Sale of Children (OPSC), and the Optional Protocol on a Communication Procedure. (Optional Protocol on Armed Conflict; State Party 167; Signatory 12; No Action 18; Optional Protocol Sale of Children State Party 174; Signatory 9; No Action 15 and the Optional Protocol on a communications procedure; State Party 37; Signatory 22; No Action; 139. http://indicators.ohchr.org/. Accessed 28 March 2018.) In addition to this legal framework that specifically exists to both empower and protect children sits the Optional Protocol to the UN Convention against Transnational Organized Crime, the Protocol to Prevent, Suppress and Punish Trafficking in Persons, especially Women and Children. (Signatories; 117; Parties; 173. https://treaties.un.org/Pages/ViewDetails.aspx?src=IND&mtdsg_no=IV-11&chapter=4&clang=en. Accessed 28 March 2018.) Together they form the contemporary legal framework to address child trafficking. (The focus of this chapter is upon the treaty-based responses to child trafficking and therefore will not address the non-treaty aspects of the international legal framework: customary law, jus cogens, soft law, or UN Special mechanisms such as Special Rapporteurs or the International Labour Organisation (ILO).)

The Convention on the Rights of the Child (CRC) 1989

recognizing the child as an active “subject” of international law who can not only be a holder of rights but also participate in crucial decision-making (Buck 2014). The CRC provides a stark contrast to the League of Nations’ Declaration of 1924 which failed to recognize the child as more than a passive object. The perspective of the 1924 shows the societal perception of children as lacking both agency and self-determination.

The age of majority has been enshrined in the contemporary world through Article 1 of the CRC at 18 years. The potential impact of the 3-year difference in age between the 1921 Traffic in Women and Children Convention and the CRC has often been overlooked. Theories of childhood do not adequately provide an explanation as to why the age limit was initially set at 20 and then increased to 21, while within the contemporary policy of the UN, “youth” are classified between 15 and 24.

The significance of the Convention with regard to trafficking is that it is the only contemporary international human rights treaty to refer explicitly to trafficking apart from the Convention on the elimination of discrimination against women (Article 6, CEDAW). The special rapporteur on trafficking indicates that the CRC is the main reference for the trafficking of children. (UN Human Rights. Office of the High Commissioner, International Standards Accessed March 2018.) Under Article 34:

States Parties undertake to protect the child from all forms of sexual exploitation and sexual abuse. For these purposes, States Parties shall in particular take all appropriate national, bilateral and multilateral measures to prevent:
- The inducement or coercion of a child to engage in any unlawful sexual activity;
- The exploitative use of children in prostitution or other unlawful sexual practices;
- The exploitative use of children in pornographic performances and materials.

The definition of Article 34 fails to explicitly reference the traffic of children, with the focus instead on unlawful sexual activity and exploitative practices. This focus echoes the League of Nations concerns of children exploited for immoral purposes, as demonstrated through the response to Question 8 in the 1927 and 1928 reports. The Article further provides a contemporary link between child trafficking and production of pornographic materials. The League expressed concerns about the connection between the traffic of children and the traffic in obscene publications, identifying them as drivers for each other. This perception appears to have consistently remained. Article 34 fails to provide any clarification as to how a state is supposed to protect children from sexual exploitation. This simply means that state parties undertake to protect children (regardless of class, gender, or race) from all forms of sexual exploitation and abuse.

Article 35 states that “States Parties shall establish all appropriate national, bilateral and multilateral measures to prevent the abduction of, the sale of or traffic in children for any purpose or in any form.” An importance of Article 35 is that it is the first international provision prohibiting the trafficking in children for the purposes of adoption, demonstrated earlier in the chapter to have been identified as an issue by the League.

The major flaw of the CRC is its failure to provide an authoritative definition of the terms “abduction,” “sale,” and “trafficking.” A consequence of this is that the
exact scope and applicability of Article 35 is brought into question, despite its relatively clear incorporation of the obligations upon state parties. These obligations go beyond requiring the states party to punish offenders after the trafficking has occurred but also to prevent trafficking from occurring, creating obligations with a horizontal effect (Humbert 2009).

The comprehensive framework provided by the CRC for the protection of the rights, dignity of children, and empowerment should be considered as a tool for understanding and responding to trafficking and related exploitation of children (Gallagher 2010). One of the major strengths of the CRC is its ability to be used as a framework for understanding and measuring child trafficking and related commercial sexual exploitation of children in the broadest possible context. (“Children and Prostitution: How can we measure the Commercial Sexual Exploitation of Children? A literature review and annotated bibliography” (UNICEF, 2nd Edition), 1996.) The issue that arises here is the perception that commercial sexual exploitation is synonymous with trafficking, adhering to the rhetoric of white sexual slavery from the early twentieth century and the focus of the League upon the traffic of women for prostitution through the 1927 inquiry.

The Committee on the Rights of the Child, established by the CRC, regularly raises the issue of trafficking. However, the Committee predominately focuses upon trafficking for the purposes of sexual exploitation, mirroring the activities of the Committee of Traffic in Women and Children 1921. Their historical counterpart focused upon trafficking for “immoral purposes” and ultimately the preservation of virtue and unwavering belief in the morally laden business of rescue. The Committee has often pronounced on trafficking-related issues in its concluding observations on state parties reports, stating that trafficking and child prostitution directly engage both Articles 34 and 35 of the CRC. The distinction drawn between the explicit references to “any exploitative practice” in the CRC is clear, as the 1921 Convention did not incorporate such an inclusive definition.

Through the preamble, the OPSC stated that the international community was:

The OPSC thus identified child trafficking for the sale of children, child prostitution, and child pornography as issues of pressing concern contrary to the move away from

**Optional Protocol to Prevent, Suppress and Punish Trafficking in Persons Especially Women and Children 2000**

Article 3 of the Optional Protocol (to the UN Convention against Transnational Organized Crime Convention) to Prevent, Suppress and Punish Trafficking in Persons especially Women and Children 2000 (hereafter, the Trafficking Protocol) defines human trafficking as:

(a) “Trafficking in persons” shall mean the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs;

(b) The consent of a victim of trafficking in persons to the intended exploitation set forth in subparagraph (a) of this article shall be irrelevant where any of the means set forth in subparagraph (a) have been used;

(c) The recruitment, transportation, transfer, harbouring or receipt of a child for the purpose of exploitation shall be considered “trafficking in persons” even if this does not involve any of the means set forth in subparagraph (a) of this article;

(d) “Child” shall mean any person under 18 years of age.

Article 3 (a) therefore establishes the three separate elements to the definition, (i) the action, (ii) the means, and (iii) the purpose or exploitation. The idea of “traffic for immoral purposes” from the League of Nations era resonates with the Trafficking Protocol, which explicitly refers to the “purpose of exploitation” prior to defining qualifying types of exploitation. The significance of this identification is that it sheds light upon the origins of contemporary responses to human trafficking generally, through illustrating the need to identify the worst forms of exploitation or “exploitation for immoral purposes.” The language has evolved, but the ideology behind it has not, and that is of vital importance when charting the development of child trafficking within international law. Moreover, while the Protocol asserts at length what is classified as exploitation, adoption and forced marriage are excluded. As has been demonstrated, the League of Nations identified links between lowering the legal age of marriage and an increase in child trafficking, while trafficking for the purposes of adoption was an issue specifically raised by some responses to e-questionnaires submitted to the Traffic in Women and Children Committee in 1927.
The defining characteristics of human trafficking are the act of transferring a person using threat, fraud, force, or coercion for exploitation. The focus upon “Traffic in Women and Children” from the League of Nations era has continued almost a century later through to the Trafficking Protocol. However, within the contemporary world, attempts to distinguish between women and children have been made. The phrase “especially women and children” in the Protocol accentuates the need for special protection; therefore, a clear link between the titles of the 1921 Convention and Trafficking Protocol can be established. The Protocol provides no specific section directly addressing children alone or clarification as to how children shall be specifically afforded additional protection due to their “vulnerability.” Whether this vulnerability is assumed, perceived, or essential for the child can only be discovered when the way the child has been constructed within the trafficking framework critiqued.

**Children and the Trafficking Protocol**

International law recognizes a distinction between children and adults. Within the context of human trafficking, this is reflected by the need for a different response (Gallagher 2010). The UN Trafficking Principles and Guidelines assert that:

> The particular physical, psychological and psychosocial harm suffered by trafficked children and their increased vulnerability to exploitation require that they be dealt with separately from adult trafficked persons in terms of laws, policies, programmes and interventions. The best interests of the child must be a primary consideration in all actions concerning trafficked children, whether undertaken by public or private social welfare institutions, courts of law, administrative authorities or legislative bodies. Child victims of trafficking should be provided with appropriate assistance and protection and full account should be taken of their special rights and needs. (UN Trafficking Principles and Guidelines. Guideline 8: Special measures for the protection and support of child victims of trafficking, Addendum to the report of the UN High Commissioner for Human Rights (E/2002/68/Add. 1), 10.)

This quote provides an insight into how the image of the “trafficked child” has been constructed. It further demonstrates the powerful protectionist discourse that dominates contemporary discussions about children. The discourse of human trafficking inadvertently strips children of their autonomy, justified by a powerful morally loaded and protectionist stance. The omission of the mean element is significant as it removes the agency of the child to make decisions about their own lives. The issue of consent and coercive or controlling behavior within the context of children has been the focus of legislative measures in recent years. The omission of the mean element through Article 3 of the Trafficking Protocol 2000 is illustrative of how all those under the age of 18 are classified as lacking agency. The issue of consent is not isolated to contemporary discussions of child trafficking but falls outside of the remit of this chapter (Samuel 2012).

The language used by the Trafficking Protocol illustrates direct links to the “White Slavery Conventions” of the early twentieth century. Terms such as “fraud,” “threats,” “abuse of authority,” and “violence” were initially adopted in the 1910 Convention (Allain 2017). Those terms coupled with the “method” and
“purpose” of the Convention constitute the three elements of contemporary trafficking. The ideology is clear from both historical and contemporary responses to human trafficking; those that do migrate ought to be prevented or rescued. The justification for this often involves reference to the concept of “in the child’s best interests.” The idea that they require protection abroad enforces the fear that the perpetrators of the exploitation were foreign. This serves as a deflection from the complicity of states allowing factors that drive migration to flourish and is mirrored through today’s response to human trafficking.

Article 3(c) states that children are considered victims “once they are recruited, transported, harboured or received for the purposes of exploitation.” Therefore, through the Protocol, only those children who undergo the “recruitment process” can be considered trafficking victims. The offense of child trafficking may be established irrespective of the use of coercion or deceit, usually required as elements of the crime when the victims are adults. (Article 3 (a) and (c) Trafficking Protocol 2000.) This gives weight to the perceived vulnerabilities of the child and provides an insight into the construction of the child within the human trafficking framework. In the case of children, no evidence or element of coercion is required for them to be identified as trafficking victims as they are perceived to be vulnerable and unable to offer informed consent to be trafficked.

**Conclusion**

The issue of protecting children is one that has a long history, which the League of Nations’ aspirations to protect and provide welfare services for children in the post Great War era are illustrative of. The vulnerability of children is a recurring issue throughout the period under review, with a source of vulnerability for children arising from their lack of full agency, both in reality and under law. The protectionist discourse is driven largely by moral concerns; however the contemporary legal responses to the trafficking of children have not significantly evolved in terms of how it is understood and recognized under international law.

Terms as morally and politically loaded as “modern slavery” or “child trafficking” invoke a powerful emotive response, and due to this power, they are offered a level of unquestioned supremacy. Numerous charities have been established and have joined forces to combat “modern slavery,” yet there is little agreement among any of these key players as to what constitutes the trafficking of children and what does not. Reflecting upon the legal responses to “White Slavery” at the beginning of the twentieth century illustrates not only the origins of what is classified as child trafficking today but provides an insight into how limited the developments have been over the past century.

This chapter has sought to chart and analyze the development of historical and contemporary legal responses to child trafficking. It has demonstrated that despite superficial changes in terminology, the parallels between historical and contemporary understanding of the phenomenon are striking and that the ideologically driven aspirations of selective protectionism remain constant. The continued focus of the
international community on young, white girls trafficked to be morally corrupted remains one of the most powerful images of the Western pantheon.

Abstract

The United Nations (UN) reconceptualization of human trafficking as a transnational organized crime of pressing urgency through the Trafficking Protocol (2000) provided an enormous boost to the urgency surrounding the issue of trafficking. In the domestic context, in Canada, however, the issue has become embedded with various pre-existing concerns, most notably child sexual exploitation and youth in the sex trade, which can be traced to the panics that emerged in the 1980s and 1990s around youth involvement in the sex trade, marked by the release of the Badgley Report in 1984. Since then, young people in the sex trade have been seen as victims to be protected rather than criminals to be punished (Bittle, From villain to victim: secure care and young women in prostitution. In: Balfour G, Comack E (eds) Criminalizing women: gender and (in)justice in neoliberal times. Fernwood Publishings, Halifax, p 195, 2006). This chapter focuses on the ways in which anti-trafficking discourses and frontline practices of criminal justice actors in Canada borrow from concerns over sexual exploitation of children and particularly the 1980s and 1990s panics over youth in the sex trade. In historically preceded ways, these concerns are used to target the sex trade under the guise of “saving the children” from sexual abuse and maintain a

targeted focus on young black men as “pimps” and exploiters. This adaptation of knowledge, tools, logics, and discourses of the 1980s and 1990s into the current anti-trafficking efforts has enabled the reconceptualization of previous procuring cases as human trafficking.

**Introduction**

Following Canada’s ratification of the UN *Trafficking Protocol* in 2002, significant efforts have been put forth to demonstrate Canada’s commitment to combating this issue (Millar et al. 2017; Millar and O’Doherty 2015; Kaye 2017; Kaye and Hastie 2015; Kaye et al. 2014; DeShalit and Roots 2016; Roots 2013). Among other things, these efforts include the establishment of anti-trafficking laws, which through various amendments have broadened the definition of trafficking to allow a wide range of criminal acts to be captured by the umbrella term “trafficking.” At the level of enforcement and prosecution, anti-trafficking efforts in Canada have been focused on targeting the sex trade. While prior to Canada’s ratification of the UN *Trafficking Protocol* (2000), sex work was seen as a fairly marginal social problem, the introduction of trafficking as a new and menacing form of child sexual exploitation and a threat to Canada’s young and vulnerable women and girls enabled renewed targeting of the sex trade under the guise of protectionism. Yet, concerns around the sexual exploitation of children are not new and among other examples have historical precedence in near identical campaigns to regulate the sexuality of young women at the turn of the twentieth century through the “white slavery” panics (Doezema 2000, 2001, 2010; Donovan 2006; Cordasco 1981; Lammasniemi 2017) and the 1980s and 1990s panics around youth engagement in the sex trade (Brock 1998, 103; Bittle 2006; Jeffrey and MacDonald 2006; Smith 2000). The current chapter explores the connections between the current anti-trafficking efforts and the pre-existing and historical issues and suggests that the meaning of human trafficking in Canada is shaped, at least in part through these linkages. The first part of the chapter explores the ways in which constructions of youth in the sex trade as “exploited” victims – a key focus during the 1980s and 1990s youth sex work panics and “white slavery” panics at the turn of the twentieth century – have been taken up in similar ways during current anti-trafficking efforts. The second part of the chapter investigates how the police strategy of targeting young, racialized men as “pimps” and exploiters of youth in the sex trade during the 1980s and 1990s has similarly been employed in ongoing anti-trafficking efforts.

The themes of this chapter arise out of an empirical study on contemporary anti-trafficking criminal justice and legal efforts in Canada. (The research was collected for my doctoral dissertation, see (Roots 2018).) The study included an analysis of
123 court informations/indictments from the province of Ontario in Canada; sentencing decisions in trafficking cases across Canada; 8 full and 3 partial trafficking trial transcripts and/or audio recordings; 15 interviews with municipal police, provincial Crown and defense attorneys, and judges; detailed analysis of Canada’s quickly evolving laws; Parliament of Canada debates on bills related to human trafficking laws and efforts; and media coverage of the issue of trafficking between 2005 and June 2016. The empirical data from this research is placed in the context of and made sense of through the work of scholars looking at historically relevant issues of “white slavery” and child sexual exploitation and specifically the panics over youth involvement in sex work panics that took hold in Canada during the 1980s and 1990s.

Historical Predecessors: “White Slavery” and Concerns over Youth in Sex Work

Contemporary anti-trafficking efforts can be traced back to the turn of the twentieth-century concerns over “white slavery” (Doezema 2000, 2001, 2010; Gallagher 2010; Walkowitz 1980; Bullough and Bullough 1987; Lammasniemi 2017). “White slavery” panics emerged at the end of the nineteenth century in England over concerns that white women and girls are being forced to work in brothels across Europe against their will. While evidence to support these panics was scant, they have had an enormous and continued impact, partly through the establishment of international “white slavery” laws beginning with The International Agreement for the Suppression of the White Slave Trade in 1904 (Doezema 1998, 2000, 2001, 2010; Gallagher 2010; Cordasco 1981; McLaren 1990; Valverde 2008; Donovan 2006; Bullough and Bullough 1987; Walkowitz 1980). Since then, there have been five other international conventions targeting “white slavery,” later named “human trafficking,” including the current Trafficking Protocol (2000). (These include The International Convention for the Suppression of the White Slave Traffic in 1910; International Convention for the Suppression of the Traffic in Women and Children in 1921; The International Convention for the Suppression of the Traffic in Women of Full Age in 1933; and The Convention for the Suppression of Traffic in Persons and the Exploitation of the Prostitution of Others in 1949.)

In addition to the influence of “white slavery” discourses, the issue of domestic trafficking in Canada has also developed within the framework of child sexual exploitation and particularly in relation to the sex trade, where the age of the labelled victim often becomes the central focus. (According to Canadian law, a person must be at least 16 years old in order to consent to sexual activity. Sexual activity is considered to be exploitative if it takes place between a person who is 16 or 17 years old and a partner who is either: (a) in a position of authority over them, (b) is relied on by the young person for care or support, or (c) if the relationship between the young person and the partner is exploitative (Department of Justice 2017). Youth sex work is also categorized as child sexual exploitation.) This focus on the youth of the trafficking victim is a part of the continuation of, what Bumiller calls, “the child abuse revolution,” dating back to the 1980s (2008, 8). In Canada, this “child abuse
revolution” was notably marked by the establishment of the Special Committee on Sexual Offences Against Children and Youths, also known as the Badgley Committee, which formed in 1981. The committee was tasked by the Canadian government to look into the issue of sexual offenses against children and youths and provide recommendations “for the protection of young persons from sexual abuse and exploitation” (Brock 1998, 102; Bittle 2013). Among other things, the Badgley Report (1984) put in motion a shift toward the reconceptualization of youth engagement in sex work as a form of sexual exploitation. In this way, youth involvement in sex trade went from a marginal social problem to “a central manifestation of the sexual abuse of children” [emphasis original] (Brock 1998, 102). With it, the Badgley Report (1984) led to the “growing perception that young prostitutes should be treated as victims in need of assistance and ‘distinct from being treated as offenders’” (Bittle 2006, 195). While the intended focus of panics over youth involvement in the sex trade was the protection of exploited youth and children forced into the sex trade against their will, these panics gave law enforcement the green light to increase the policing and criminalization of the sex trade (Jeffrey and MacDonald 2006; Smith 2000; Brock 1998).

These very same paternalistic discourses, which formed as a part of a larger concern over child sexuality in the 1980s and 1990s and during the “white slavery” campaigns at the turn of the twentieth century, are also at work in the contemporary anti-trafficking strategies. The prevalence of concerns over child sexual exploitation and sex work are evident in legislative debates, police interviews, and media coverage on trafficking. For instance, in one parliamentary debate, one Member of Parliament (MP) claimed: “we must not forget that almost 50% of victims [of trafficking] are minors” (House of Commons, Nov 26, 2013, Bill C-452). This generous estimate is brought even higher by an interviewed anti-trafficking police officer who noted that “the girls that we deal with, first, most of them are very young” and further that “I can honestly say that 60–70% of the girls we deal with are under the age of eighteen.” These estimates are also frequently accompanied by categorization of young people as minors or children, which, as Deborah Brock points out, collapses important distinctions between children and young people.

Indeed, as scholars have noted, western definitions of childhood have often been criticized for neglecting to take into account variances cross-culturally, generationally, but also based on gender and variations between children and youths of different ages, in effect allowing for the capacity of 18-year-olds to be equated with that of 12-year-olds (Brock 1998, 103; Buck 2014; Dauda 2010). The result, according to Claudia Dauda, “is an essentialized concept of childhood that encompasses a variety of experiences from infancy to adolescence, or youth, and is often universalized and globalized; at the same time, it marginalizes and silences the actual experience of childhood” (2010, 228). Sexuality, in this context is seen as exclusively an adult terrain. Therefore, if it is awakened in children, it is always through external sources and seen as quite dangerous (Dauda 2010). And so, as Dauda explains, “childhood sexuality is not only endangered, needing protection against external harm, but also dangerous, posing a threat to the broader social order and in need of control” (Dauda 2010, 229). The control and protection of childhood
sexuality in the context of fears around human trafficking is entrusted in the hands of specialized anti-trafficking police units that have formed within municipal police forces across Canada.

**Policing Trafficking**

At the time of writing in 2018, there are specialized anti-trafficking teams in Toronto, Peel Region, York Region, Durham Region, Ottawa, Winnipeg, Calgary, and London, while other municipal police forces, such as Vancouver and Edmonton, house them in their Vice Units.

These local policing units play an important role in anti-trafficking efforts, as they have been responsible for the vast majority of trafficking charges in Canada (Roots 2018). As one defense attorney I interviewed contends:

now that they have specialized police departments or teams for police forces who are only investigating human trafficking...you’re going to see more human trafficking charges. That’s the biggest reason that you weren’t seeing it before. It’s cause the police weren’t looking for it.

Similarly, in response to a question about why there might be an increase in human trafficking arrests in recent years, one Crown attorney attributes it to, “the establishment of a squad, not only in Toronto and the GTA [Greater Toronto Area], like they’re in York Region and other regions...the advent of that is helpful.”

In addition to increasing the numbers of trafficking charges, these local police units also play an important role in shaping the meaning of human trafficking and understandings around who is a trafficker and who is a victim. As Richard Ericson observes, the police are at the forefront of producing definitions of crime. In carrying out their obligations, Ericson notes that the police make events into crime and individuals into criminals (9) and “are given organizational capacity to produce particular levels of crime and to produce particular types of crime to the relative exclusion of others” (1983, 7). This was captured by officers’ comments regarding lack of knowledge on trafficking when the specialized anti-trafficking units were initially formed. According to one member of anti-trafficking policing unit interviewed for the study, when he was initially joined, “there was nothing [in terms of knowledge on the offence]. I was like, this is fucking terrible, no one knows what’s going on here. We’ve come a long way.” There was also “no formal training on human trafficking. There was none.” To learn about the issue, this member of anti-trafficking police read “reports, studies, blogs, internet stuff. Everything I could. ‘Pimping’ books, breaking down hip hop culture, listening to lyrics, understanding what they’re saying. Realizing that it’s [knowledge on human trafficking] embedded in popular culture today.” He went on to note:

I didn’t know nothing about it [human trafficking]. So I read a book...”Somebody’s Daughter”...that book takes place in the early 90s, late 80s. It’s basically about the Toronto,
Halifax pimping ring back then...I read that book that he [referring to his superior] read, and thought, holy, this stuff is happening from back then and we’re not doing anything about it? So, I went almost immediately, and we started changing the way we did things. [emphasis added]

As such, the knowledge gap that existed at the outset was filled with historical “knowledge” from 1980s and 1990s “pimping” issues and stereotyped understandings of “pimping” circulating in popular culture. *Somebody’s Daughter: Inside the Toronto/Halifax Pimping Ring*(1996), the book used by the anti-trafficking policing unit to learn about human trafficking, was written by journalist Phonse Jessome. As Jeffrey and MacDonald describe it:

the book highlights the violence of the pimps by fictionalizing parts of the story and creating some characters to make the storyline more readable (and dramatic). Fact blends with fiction throughout to create a melodramatic story of innocent victims and evil predators. (2006, 160)

According to one sex worker interviewed by Jeffrey and MacDonald, the book “presented a lopsided view of prostitution and, in the end, such an approach fails to address the real issues” (2006, 160). And so, rather than learning about trafficking from evidence-based research, police knowledge around trafficking stems, at least in part, from a sensationalist and partly fictionalized portrayal of historical concerns over sex work. Yet, despite the troubling source, police formation of knowledge on human trafficking from a book on 1980s and 1990s panics over youth involvement in the sex trade provides strong evidence to suggest that knowledge on human trafficking in Canada as well as police tactics, strategies, and tools employed are simply resurgences of historical concerns over youth in the sex trade. Due to the impact of Jessome’s book in shaping police “knowledge” on human trafficking and while acknowledging the problems with it, the arguments made in this paper will nonetheless rely on it. This is to demonstrate the information that exists on the 1980s and 1990s panics and to explore the ways in which it compares to current domestic understandings of human trafficking.

The development of anti-trafficking policing units in itself is preceded by the specialized task forces that emerged in 1990 in Halifax, Montréal, and Toronto in order to “assess the extent of juvenile prostitution in their cities and to devise programs that would encourage young prostitutes to abandon the sex trade” (Government of Canada 2003: City Task Forces and By-Laws). As Jeffrey and MacDonald write, despite disagreement by sex workers, it was police insistence that “pimping” was a significant issue and so led to the creation of a specialized task force aimed at dealing with the issue (2006, 117). Analogous to the current anti-trafficking efforts (DeShalit et al. 2014), generous funding was allocated to the operation of these specialized police teams and led to many more patrol officers being hired to police sex workers (Brock 1998, 94). According to Deborah Brock, in 1988 alone the city of Toronto spent $6.3 million on policing sex work under the guise of protectionism (1998, 94). Many more arrests of sex workers, clients, and “pimps” took place than in previous years, and specialized squads conducted street sweeps resulting in the arrest of hundreds of people in one night. As Brock notes, a
three-night sweep in November of 1987 led to the arrest of 442 sex worker customers (1998, 90). While this was one notable example of targeted enforcement by police, these tactics were common during this time and were justified largely through the perceived need to protect young people from sex work.

**Protection and Criminalization**

Despite the evolution of tactics, police in anti-trafficking units maintain that their strategies, tactics, and tools are novel. One of the ways they carve out this position is by pointing to their shifted approach from criminalization to protectionism as a new way of dealing with the sex work, “pimping,” and trafficking. Take, for instance, the comment of a member of anti-trafficking policing unit: “at the end of the day, people still think a hooker is a hooker. They do!...and that’s why we need experts to tell them.” The comments suggest that sex workers should not be criminalized per se, but rather protected. This is seen as a new approach that now also requires the input of expert police officers. Similar views were conveyed by another member of the anti-trafficking policing unit, who noted: “I needed them [police officers] to see, not look at a girl that’s a prostitute but look at her as a potential victim. Not look at charging her, but look at who is responsible for controlling her.” As the police officer explained, the decision to hire officers to work in the specialized squads was dependent on their ability to see youth in the sex trade as victims, rather than offenders. Yet, this paternalistic position around sex work is not new and is given particular urgency through a focus on the youth of the potential or labelled victim. As Jessome writes in the context of the 1980s and 1990s concerns over youth in the sex trade: “the key to their growing success was a dramatic change of attitude...the new approach had police targeting the pimping rings instead of their youthful victims” (1996, 7). As such, local anti-trafficking police, just as anti-“pimping” task forces had in the 1980s and 1990s, are framing their efforts as a part of “a new and approved approach.”

In an effort to rescue and protect victims, police have turned their attention to targeting traffickers. In contrast with internationally prevalent understandings of traffickers as being a part of Eastern European and Asian transnational criminal organizations, the primary target in Canada has become the prototypical black “pimp” – a figure easily resurrected and redeployed as part of Canada’s anti-trafficking efforts (Roots 2018; Bernstein 2012). This is made possible by the combined effect of Canada’s trafficking laws, which focus the definition of trafficking on the term “exploitation,” thus enabling its conflation with the offence of procuring (s. 212(1) of CCC) (Roots 2013, 2018; see also Chuang 2014). It is further supported by the fluid understanding of the stereotyped term “pimp,” which enables the construction of various scenarios as “pimping” (Jeffrey and MacDonald 2006, 117). Thus, as Jeffrey and MacDonald contend, if evidence for one scenario is absent, other scenarios are employed to justify continued targeting of the sex trade (2006, 118). The “pimp,” according to Anita Kalunta-Crumpton, is a racialized, classed, and gendered image that reinforces the stereotypical popular mythology of
black men in connection with black sexuality and crime (1998, 567, see also Jeffrey and MacDonald 2006). As Patricia Hill Collins observes, “the controlling image of Black men as criminals or as deviant beings encapsulates this perception of Black men as inherently violent and/or hypersexual” (2004, 158).

This focus on young black men in anti-trafficking efforts is seen most notably through the visual portrayal of accused in trafficking cases reported on by the media. Many individuals charged with human trafficking offenses are paraded in newspapers with screaming titles, such as “Taylor Dagg, 23, wanted for human trafficking in Ottawa” (CBC News 2014b) and “Toronto police arrest 4 men in human trafficking probe involving teen victims” (The Canadian Press 2018). These news reports, which bring together race, class and gender based fears of (white) young women being victimized by black men, declare accused as “human traffickers” through visual portrayals – often in the form of a mug shot – and accompanied by an unverified description of the terrible things they have done. As Finn points out, a police mug shot, which permeates people’s daily lives through newspapers, “is an image that is taken to indicate criminality” (2009, 1). Therefore, publishing a mug shot of an accused confirms their guilt even before the charges are substantiated (Finn 2009, xviii). This is particularly noteworthy since pictures, in contrast with other forms of visual representation, are taken to be more objective, despite the fact that they are as cultural as they are natural (Finn 2009, xii). Consequently, the visual portrayal of the accused through mug shots contributes to the confirmation of the accused as “human trafficker,” despite the fact that the charges, at that point, have not been proven in court.

The targeting of young black men via the anti-trafficking agenda was also confirmed by criminal justice actors interviewed for my study. For instance, as one Crown attorney contends, traffickers are “youngish, they are in their 20s generally, some are involved in gangs, the majority of the people, if not all. There’s ones who’s not – they’re black – young black males has been – from my experience” [sic]. Similarly, a defense attorney asserts:

my understanding when I first read about the anticipated legislations dealing with human trafficking was basically to help people who are being moved into our country and tricked and manipulated and coerced into the sex industry whether it would be dancing to escort to prostitution. But what I really find is minority males who break off with dancers. Those are the ones I find end up being charged all the time. [emphasis added]

In the 1980s and 1990s, panics over youth involvement in the sex trade led to similar targeting of young black men as “pimps” (Brock 1998; Jeffrey and MacDonald 2006; Smith 2000). As a task force representative from Tanya Smith’s study revealed, while the decisions of police were not racially motivated, “it was true that black men were mostly arrested because of their involvement in the Toronto prostitution ring” (2000, 58). Deborah Brock provides additional examples of this racialized criminalization from the 1980s and 90s, such as for instance, a 1987 Toronto Sun article entitled “Teen Hookers ‘White Slaves’. Cops Report Runaways Tortured” (1998, 123). These same references to “white slavery” picked up by the
newspaper were also made by a member of the Metro Police Juvenile Task Force (ibid.). A few days prior to the publication of this article, the now former Toronto Deputy Chief William McCormack was also recorded saying that “the real culprits behind this [youth involvement in the sex trade] are the ‘white slavers’ and those are the people we would like to see completely eradicated” (as cited in Brock 1998, 123). As Brock writes, the reference to “white slavery” by the Deputy Chief created a direct link between the crisis over youth involvement in the sex trade and the racialized scenarios disseminated during the “white slavery” panics at the turn of the twentieth century where narratives of white women preyed upon by racialized men were used to create a moralized panic (1998, 123; see also Doezema 2010; Lammasniemi 2017). Jeffrey and MacDonald explain that, “the story of evil pimping rings and innocent children was much more interesting to the public than was the earlier, careful Children’s Aid Society Reporting, which linked youth prostitution to abusive parents, runaways and homelessness” (2006, 158).

As such, the prevalent narrative of domestic human trafficking in Canada follows the now very familiar storyline of a young, white girl or woman being victimized by a black “pimp.” This has been seen during the “white slavery” panics at the turn of the twentieth century (Doezema 2010; Valverde 2008; Donovan 2006; Lammasniemi 2017) and the panics over youth involvement in the sex trade of the 1980s and 1990s in Canada (Jeffrey and MacDonald 2006; Brock 1998). The storyline gains further emotive power through emphasis on the violent behavior of young black men labelled as “pimps” and “traffickers” toward the victims. Women and girls’ victimization at the hands of “pimps” draw on a particularly disturbing image of violence and brutality exhibited against the innocent and vulnerable (see also Doezema 2010; Bumiller 2008; Valverde 2008). As Kristin Bumiller observes, the anti-sexual violence agenda, which anti-trafficking efforts are a continuation of, is reinforced through stories of “sadistic violence” exhibited against women and sensationalized by the media (2008, 8). This is demonstrated in what was called a “sex-trafficking series” published by the Toronto Star in 2015. The series describes victims as “beaten, branded with their pimp’s name, and bought and sold across Ontario,” having “a grisly red scar wrapping around her right ankle from an attack last year that severed her Achilles tendon and left her foot ‘just hanging there,’” being burned with cigarettes, “beaten black and blue, starved” until they service a certain number of men and having guns put against their heads or shoved inside their mouths (Toronto Star 2015b). According to a different article from the same series in the Toronto Star, “some of the girls are beaten by pimps, whipped with coat hangers heated up on a stove, punched, choked, burned and forced to sleep naked at the foot of the bed like dogs” [emphasis added] (Toronto Star 2015c).

A reading of these news stories on sex trafficking, alongside an analysis of media coverage of the 1980s and 1990s panics over youth involvement in the sex trade by Jeffrey and MacDonald (2006) and Brock (1998), reveals undeniable parallels. Stories of youth involvement in the sex trade from the 1980s and 1990s include sensationalized headlines such as “Former prostitute has scars all over,” “Yarmouth warned about pimps,” “Threats, abuse forced girls into prostitution,” and “Young
women were sex slaves,” which as she notes “allow us to be privy to tales of recruitment, coat-hanger beatings and physical and emotional scars that will never heal, all because of the evil activity of the pimps in Nova Scotia” (Smith 2000, 55). Notably, Jeffrey and MacDonald discuss a newspaper article from 1992 where a police officer describes the “hanger beatings,” noting that “the hanger is placed on a stove burner and then applied to various parts of the girls’ bodies” [emphasis added] (2006, 159). The nearly identical descriptions of the heated coat hanger scenario described in the 2015 Toronto Star article on sex trafficking above and the 1992 article on “pimping” rings in Halifax, Nova Scotia, captures the parallels in the media focus almost too well.

At the same time as the violence of the accused against the victim is seen as a defining feature of human trafficking, offenders are also constructed as employing subtle approaches to lure and manipulate their victims – one of these is the “Romeo tactics.” As one police officer described it:

Pimps...will approach a girl and the way they do it, how they will shower her with gifts, that’s the process of procurement. ....and all of a sudden, boom! Now you’re going to work for me. It goes from that starting point of, I’m going to be your boyfriend, I’m going to shower you with gifts, and it ends when they say, now you’re going to work for me. So it’s not just the act of you’re going to work for me, it starts way before that.

Another police officer noted that the “Romeo tactics” is, “where they get the girls to fall in love with them and from that position they exploit their affection to transition them to working in the sex industry.” That such romancing is a form of manipulation is explained by a third officer as follows: “he doesn’t have to tell you he’s going to kick your ass or beat you, he just has to romance you, do whatever, manipulate you.” Relying on this grooming tactic allows Crowns and police to make the argument that the complainant was lured and forced into their situation, not physically, but through false promises of love, thus turning otherwise mundane behaviors into recruitment tactics.

The dangers of the “Romeo tactics” are also disseminated in the media. For instance, a Toronto Star article which covers an interview with an accused human trafficker describes it as follows:

'lt begins with the boyfriend stage, he says, where pimps prey on vulnerable girls and pretend to be in love. .....But, he added, it's an illusion because 'there's no love in the sex trade'. The next stage is the 'sale' where the pimp starts to manipulate the girl into thinking prostitution is an easy way for them to make fast money so they can start to build a future together... 'and, she'll do it. Why? Cause you just sold her a dream'. (Toronto Star 2015c)

This recruitment tactic is once again depicted as a new development in the “pimping” world. This is seen in a Toronto Star article on human trafficking, where a mother whose daughter was forced into the sex trade by her boyfriend is quoted as saying, “we never knew about boyfriend pimps” (Toronto Star 2015b). Yet, similar depictions of boyfriend “pimps” as a new development can also be evidenced during the 1980s and 1990s panics over youth involvement in the sex trade when the
police focus remained on Nova Scotia and, in particular, the “street gang” North Preston’s Finest. This shift from violence to more subtle tactics is also captured in the writing of Phonse Jessome:

Violence had been touted as the key to pimp’s success. Today it is seen as a weakness. The Game is played for money and the players adjust to rule changes quickly. If beating girls means going to jail, then beating girls is not a smart man’s way to play. One jailed pimp recently joked about this trend, saying his colleagues now had to buy ice-cream cones for their girls to keep them happy. (1996, 14)

Contemporary police depictions of traffickers’ recruitment tactics as new and more dangerous due to their subtlety, while borrowing from strategies used during the 1980s and 1990s panics over youth involvement in the sex trade, is one way in which human trafficking is being reconceptualized at the national level to take on a more commonplace and mundane meaning.

These narratives are made even more terrifying through the association of human trafficking with organized crime. As Anne Gallagher (2010) notes, international anti-trafficking efforts have shifted from a human rights framework emphasizing the protection of women and children to a focus on challenging organized crime. This was achieved by making the *Trafficking Protocol (2000)* a part of the *Convention against Transnational Organized Crime (2000)*, which explicitly links organized crime and human trafficking at the international level. According to John Ferguson, the *Trafficking Protocol (2000)*, which is governed by *The Convention against Transnational Organized Crime*:

was presented to the international community as a new tool, an internationally sanctioned instrument for governments to use in their fight against the threat of rapidly expanding transnational organized crime groups that were believed to be profiting from the formed movement of, and abusive exploitation of, enslaved people across national boundaries. (2012, 68)

Indeed, some police officers within anti-trafficking units interviewed for my study went to great lengths to demonstrate the connection of organized crime to human trafficking. As one such police officer explained:

My background was heavily organized crime based at the time, so bringing that into these types of investigations...At the time the vice guys were taking down massage parlours, bawdy houses, and all the girls were being charged. They were charging the girls working in the massage parlours, girls were being charged with prostitution offences and they weren’t having any success arresting convicting pimps, they hadn’t laid a single human trafficking charge. So, I came and started seeing how they did things and applied my experience and realized that intelligence wise we were lacking intelligence to what was really happening.

The officer’s suggestion that his experience with organized crime enabled him to make the necessary changes in the organization’s anti-trafficking efforts to successfully identify, arrest, and charge suspected human traffickers shows the extent to which organized crime is seen as an important component of trafficking by police.
officers. The extent of this belief was captured by the comments of another officer who estimated the extent of organized crime involvement in trafficking activities to be at 85–90%, noting that:

You have the one offs. Guys that are entrepreneurs, who think they can make money doing it. The majority of the guys that we deal with are gang members.

While this position rests upon and promotes a view of human trafficking and organized crime as closely and dangerously linked, the connection is not as well established as these representations suggest (see Kapur 2005; Kempadoo 2005; Bruckert and Parent 2004; Roots 2013; Aradau 2008; Millar and O’Doherty 2015). As summed up by Jyoti Sanghera in her study of trafficking discourses, “in view of the overall paucity of evidence on the issue of trafficking globally, it is nearly impossible to make a claim that trafficking is entirely or even largely a problem of organized crime” (2005, 15). And yet, the lack of empirical support does not erase organized crime from the equation. Instead, as Anna Pratt (2014) explains, organized crime has become loosely defined and includes violent street crimes, gun crimes, and sex work by smaller, decentralized criminal groups.

This fluid understanding of organized crime has, in Canada, led to the adaptation of the word “street gang,” alongside or in place of the term “organized crime.” In effect, threats posed by “street gangs,” who may or may not be well organized, are seen as existing on a continuum of organized crime. This is captured by a comment of one Crown attorney who describes those involved in trafficking activities as:

either officially gang related or there’s a group, like, they’re passed [women] on from one to another sometimes. Even though it may not be like the Crips or the Bloods, in some cases it is, but a group of individuals who are involved in it together and passing girls among each other, so officially and unofficially gangs, I guess.

The overriding efforts to connect organized crime with human trafficking are also seen through reference to “street gangs” at the level of law enforcement. For instance, according to information provided by Criminal Intelligence Service Canada (CISC) to the Standing Committee of Justice and Human Rights, “trafficking is done through organized crime networks. …street gangs facilitate the recruitment, control, movement and exploitation of Canadian-born females in the domestic sex trade” (Canada’s House of Commons 2012, 11). The link between small-scale criminality and transnational organized crime syndicates is further drawn by Canada’s federal policing agency, the Royal Canadian Mounted Police (RCMP), which states that:

The involvement of transnational organized crime groups in human trafficking is part of a growing global trend. Human trafficking generates huge profits for criminal organizations, which often have operations extending from the source to the destination countries. These transnational crime networks also utilize smaller, decentralized criminal groups that may specialize in recruiting, transporting or harbouring victims. [emphasis added] (RCMP 2014)
Thus the RCMP views “street gangs” as the middle man between victims and transnational organized crime groups.

Parliamentarians are also unclear in their understanding of the relationship between organized crime and “street gangs.” For instance, in debates over Bill C-452, which proposed consecutive sentencing for human trafficking convictions and the removal of proceeds of crime from the accused, one Member of Parliament argued that “street gangs” have become central in human trafficking efforts in Canada. Yet, the MP later diminishes the role of “street gangs” suggesting that “there’s a lot of talk about street gangs, but transnational criminal organizations are very involved in human trafficking, whether it be international or national” (House of Commons, April 29, 2013, Bill C-452). The fluid and interchangeable uses of the terms “street gang” and organized crime demonstrate the continuation of organized crime in loosely defined ways, enabling it to take on new forms.

Similar efforts to construct links to organized crime through the use of the term “street gang” can be traced to the 1980s and 1990s panics over youth involvement in the sex trade. During this time, the police maintained that organized crime was controlling the sex trade, therefore conflating sex trade with drug trafficking and other criminal activities (Brock 1998, 52). In particular, as Brock observes, the danger to young sex workers in the 1980s and 1990s was traced to “gangs” of black “pimps” operating out of Dartmouth, a small town in Nova Scotia (1998, 125). According to Smith, stories of disappeared women and girls were used by the media at that time to suggest that “a gang of North Preston’s black men had developed an elaborate network within which vicious means were being used to maintain these girls in positions of fear subservience and danger” (2000, 75). Evidence to the continuation of this within current anti-trafficking efforts is captured by newspaper titles such as Notoriously violent N.S. gang recruiting women, girls and pimping them out in Ontario: police (National Post 2016), North Preston’s Fine gang funnels girls to Ontario for prostitution (CBC News 2014a), and North Preston’s Finest: sex trafficking from Halifax to Toronto (CBC News 2015), all of which describe the lengthy and violent history of North Preston’s Finest in running sex work operations across Canada. In effect then, drawing out these parallels enables us to see the ways in which contemporary conceptualizations of human trafficking have been shaped through historical precedence, rather than constituting a new emerging threats.

Conclusion

This chapter has explored the ways in which anti-trafficking efforts in Canada have been shaped by historical precedence set by the “white slavery” panics that took place at the turn of the twentieth century and more notably by the 1980s and 1990s panics over youth involvement in sex trade in Canada. The paper drew out numerous existing parallels between the two historical concerns and the contemporary anti-trafficking efforts including the protectionist approach toward victims of trafficking, focus on youth of the victim, narratives of grooming and violence, as well as constructions of organized rings of black “pimps” as exploiting the innocence
and vulnerability of young, white children in Canada. By doing so, the paper demonstrated that contemporary understandings of human trafficking, its key components and actors, and efforts to combat it are shaped by the deployment of this historical precedence by local law enforcement, legal, and lawmaking actors. These troublingly close parallels challenge assertions that human trafficking is a new threat emerging in response to a globalized world and point to a need to pay closer attention to the quality of and process of making criminal cases into human trafficking (Gallagher and Surtees 2012).

Abstract

Despite its relatively small territory and the stability of its borders since the thirteenth century, the Portuguese State has never been able to fully appropriate the “monopoly of the legitimate means of movement” and did not possess the infrastructural power (in Michael Mann’s formulation) – compliant agents and efficient instruments – to control the mobility of the population. As a consequence, many Portuguese emigrated illegally. Among the four million Portuguese who left their country between 1822 and 1974, many of them did it illegally, without any passport, with a fake passport or by lying about their age or employment. The aim of this chapter is to analyze both discourse and practices related to human trafficking in Portugal in the modern era, from 1822 and the independence of Brazil up to today. We will first see why the Portuguese elite presented, since the 1830s, emigration to Brazil as a white slave traffic. Then we

will analyze the different ambiguities of the clandestine emigration during the dictatorship of the New State (1933–1974). Finally, in epilogue, we will see the mutations of irregular migrations in a country transformed by democratization and Europeanization.

Despite its relatively small territory and the stability of its borders since the thirteenth century, the Portuguese State has never been able to fully appropriate the “monopoly of the legitimate means of movement” (Torpey 2000, 1–2) and did not possess the infrastructural power (in Michael Mann’s formulation) – compliant agents and efficient instruments – to control the mobility of the population (Mann 1984). As a consequence, many Portuguese emigrated illegally. Among the four million Portuguese who left their country between 1822 and 1974, many of them did it illegally, without any passport, with a fake passport or by lying about their age or employment. From 1855 to 1910, Maria Ioannis Baganha (1991) estimates that, depending on the time periods, between 5% and 15% of all emigration were illegal. In some regions, such as the Azores islands (Amorim 1993), irregular emigration seemed to be much more important, but, by definition, historians can hardly measure precisely the flows that tried to escape from States’ control. Numbers were higher during the New State dictatorship (1933–1974) which tried to prevent the popular classes from leaving the country. Almost 2/3 of the 900,000 Portuguese who emigrated to France between 1957 and 1974 did it irregularly (Pereira 2012).

As early as the nineteenth century, illegal emigration was constructed as a “public problem” by some of the Portuguese elites who wanted to control the mobility of the population (Pereira 2013). Newspapers and politicians blurred the lines between “human trafficking” and “human smuggling.” Illegal emigration was often defined as “human trafficking.” Migrants were always represented as gullible, devoid of critical sense, and ready to chase after the false promises of recruiters, traffickers, emigration agents, or unscrupulous smugglers who, motivated by profit alone, artificially spawned emigration. These middlemen – operating either legally or illegally – were turned into convenient scapegoats. They were to blame for emigration in order to hide the many factors that could explain the massive levels of departures: misery, social inequality, lack of freedom, and rigid social hierarchies. Depicting migrants’ future employers as potential exploiters, by denouncing the “white slave traffic,” Portuguese leaders sought to legitimize government initiatives that restricted departures.

In this chapter, my aim is to analyze both discourse and practices related to human trafficking in Portugal in the modern era, from 1822 and the independence of Brazil up to today. For this period, it is essential to keep in mind three factors. First, up to the 1980s, Portugal was mainly a country of departure. So, discourse and practices related to human trafficking mainly concerned Portuguese migrants abroad. In the 1980s, Portugal became a country of immigration (despite the persistence of emigration, which in fact never abated), and human traffic also affected foreigners in this country. Secondly, up to 1975, Portugal was an Empire in which human traffic and forced labor were pivotal elements (Clarence-Smith 1979; Cleveland 2015; Jerónimo 2015). Portugal was the first European kingdom to enslave or to trade directly slaves in sub-Saharan Africa in 1441, short-circuiting North African slave traders (Mendes 2008). Portugal was also the main European power to be involved
in the Atlantic slave trade between the sixteenth century and the nineteenth century. Brazil, the main Portuguese colony, received four million African slaves, the third of all the Atlantic slave trade (Dorigny and Gainot 2006). It should be noted that the Portuguese government prohibited the entry of new slaves in the mainland in 1761. In 1773 a free birth law allowed the children of a female slave to be free. Nevertheless, the enforcement of this law was difficult and many slave owners ended up keeping their slaves (Caldeira 2017). In addition, Portugal was one of the last colonial power to abolish the slave trade (1836) and slavery (1878) in its Empire. Furthermore, the main purpose of these bans was to please Great Britain, which had diplomatic and economic power over Portugal and championed the abolition of the slave trade and, afterward, of slavery.

In practice, the slave trade followed, irregularly, until the 1860s, and covert slavery remained in the Portuguese Empire until the 1960s. Consequently, although we are going to focus on the metropolitan case, we cannot understand speeches on human trafficking, a so-called white slavery held since the 1830s in Portugal, without taking into account the existence of slavery in the Portuguese Empire and the conflicts that this phenomenon provoked between Lisbon and London. Denouncing an alleged white slavery, the Portuguese elites wanted to hide their role in the slave trade and the maintenance of slavery practices in its African territories. It was also a way to save the “national honor [that] was at stake” (Marques 2006, 181) because of the slave trade. Portuguese elites wanted to express that Portugal was a European country, while the other European powers considered it as archaic and against the Enlightenment values.

Finally, it is necessary to recall that democracy and the right to come and go freely have not really been guaranteed in Portugal before 1974. Until then, the various regimes have tried to reduce the departures, which has caused the existence of an important illegal migratory flow. It is therefore necessary to be cautious about public discourse and the legislation that has blurred the distinction between illegal immigration and human trafficking in order to justify the measures which prevented Portuguese to move abroad. This was particularly the case for women whose rights have been greatly reduced in order to, allegedly, protect them from prostitution networks.

We will proceed in a chronological order. We will first see why the Portuguese elite presented, since the 1830s, emigration to Brazil as a white slave traffic. Then we will analyze the different ambiguities of the clandestine emigration during the dictatorship of the New State (1933–1974). Finally, in epilogue, we will see the mutations of irregular migrations in a country transformed by democratization and Europeanization.

How the Denunciation of Human Trafficking Legitimated Colonialism and Restrictions to Freedom of Movement

A Rhetoric of Reaction and Colonial Project

The independence of Brazil in 1822 did not cut off the migratory flow linking the metropolis and its ex-colony that existed since the seventeenth century (Godinho 1978; Rowland 1998). Portuguese emigration, up until the 1950s, was mostly to
Brazil, with networks linking the Portuguese countryside, particularly in the north of the country, and the former colony. Emigration was part of the peasants’ strategies to maintain their properties, to give opportunities to some of their children, and to obtain some capital thanks to remittances. Emigration was a key factor for the reproduction of the central and northern Portuguese rural society composed by small and medium landowners (Silva 1998).

Even if this migratory flow had positive effects in a backward rural country, part of the elites tried to refrain it. Employers – large- and medium-sized agricultural landowners – and a segment of the political leadership deplored the departures and believed there was not enough labor force in Portugal (Pereira 1981). Mercantilist viewpoints were still dominant among employers and the political elite: authorities wanted to retain an abundant workforce in order to maintain wages low (Foucault 2004, 70–71). Emigration was described as catastrophic: allegedly, young men fled the countryside where only the women, children, and elder people remained. Emigration was also depicted as both an illusion and a mistake, a trap which only the naïve would ever step into. However, this reactionary rhetoric – in the sense given to this term by Albert Hirschman (1991) – grounded on the notions of the perverse, futile, and risky nature of emigration, elided the misery prevalent in Portugal at the time, misery caused, in part, by an excess of population that the elites wanted to maintain.

Furthermore, after the independence of Brazil, Portuguese governments entertained the project of creating “new Brazils” in Africa (Alexandre 2000). Thus, wherever labor force excess existed in the mainland, people should head toward colonies (mainly Angola and Mozambique) rather than Brazil. Hence emigration to countries outside of the Empire was considered as undermining it, diverting settlers from colonizing Portuguese territories, developing their economies, “civilizing the indigenous,” and defending national sovereignty. These statements were repeated over and over between the 1830s and 1974 (Castelo 2007).

To support this thesis, numerous – and often hyperbolic – statements suggested that the Portuguese in Brazil were nothing but a replacement of African slaves, reduced to the status of “white slaves,” thus disgracing the home country and its international reputation. In the 1830s, even if the departures were reduced – there is no reliable data on the waves in the 1830s, but an inquiry on emigration made in 1843 showed that the phenomenon was far from being massive (Sousa 1999) – some public discourses define emigration as disastrous and equate it to “white slavery.” During the nineteenth century, the parliamentary debates, the press, and the few books dedicated to emigration show a succession of dramas linked to emigration. A multitude of misfortunes would await those who headed toward Brazil, British Guiana, or the West Indies. According to these narratives, most often based on secondhand materials, migrants traveled in deplorable conditions, worse than in slave trade boats: piled up, malnourished, without any comfort, and sometimes constrained to work during the journey. The Portuguese (and Brazilian) press regularly mentions overloaded boats landing in Brazil or migrants who had died during the trip, sometimes thrown overboard.

Once in Brazil, the Portuguese who had not paid for their trip were negotiated by certain captains. These migrants had to work for a number of years to settle their
debts. They were sometimes employed in agriculture, working with slaves and also being abused. Based on Portuguese official reports, Caroline Brettell wrote that “those who went to the Brazilian fazendas (plantations) were badly fed, treated like slaves and punished like dogs” (Brettell 2003, 12). Throughout the nineteenth century, Portuguese consuls in Brazil warned Lisbon, occasionally doing so in hyperbolic terms, that Portuguese migrants were sometimes reduced to slaves by “service contracts” (Alves 1993), forms of indentured labor (Stanziani 2014), that stipulated that they had to work a certain number of years to pay back their trip.

Although they are one of the main sources for historians, descriptions of emigration by diplomats should not be taken literally. Full of miserabilism, these actors use expressions and rhetoric that often tend to obscure rather than describe reality. These descriptions most often hide the capacity of migrants to act, their strategies, and the migratory chains that structure their mobility (Borges 2009). While it is true that many migrants suffered various dominations and abuses during their journeys and in the countries they joined, they were more likely to emigrate within a migratory chain based on family links.

**White Slave Trade Against Black Slave Trade?**

João Pedro Marques points out that “mid-nineteenth-century Portugal has always written more about white slavery than about the trafficking of African slaves” (Marques 1999, 342). In fact, on the one hand, Portuguese elites wanted to hide the survival of the slave trade and slavery, and on the other hand they wanted to refrain emigration. Consequently, political discourse on Portuguese in America generalized the abuses suffered by a minority to all emigrants.

Furthermore, the accusation of white slavery practiced in Brazil hides the relations of domination that existed in Portugal. With very few exceptions, regarding the fate of soldiers or fishermen subject to ship owners, the expression of white slavery is not used for workers who remained in Portugal. While in the industrializing countries, the term “slavery” and the comparison between proletarians and slaves were used to highlight the deterioration of the living and working conditions of workers subjected to exhausting workloads and discipline (Grenouilleau 2014), in Portugal this argument can rarely be seen in parliamentary debates. It is true that industrialization was still marginal at that time in Portugal, but “social panics” do not really depend on the magnitude of a phenomenon to exist. Emigration to Brazil was deplored and considered massive in the 1830s when departures were still reduced and only reached its magnitude in the 1910s (Newitt 2015).

The sale of children or the subjugation imposed on domestic servants by their employers, denounced in the Brazilian context, existed at the time in Portugal (Sousa 1999; Brasão 2013).

We cannot understand the frequent early use of the expression “white slave” in Portugal without taking into account the conflicts between Lisbon and London around the slave trade. Since 1807, Britain had repeatedly tried to coerce Portugal to abolish the slave trade. Through the Palmerston Bill (1839), the British
government arrogated itself the right to intercept Portuguese ships suspected of carrying slaves and to judge their captains. This decision, considered an attack against national sovereignty, profoundly influenced the Portuguese elite (Marques 2006). It revealed the diminished power of the country and suggested that Portugal, refusing to effectively ban the “infamous traffic,” was a nation that refused the values of the Enlightenment, progress, and civilization, by protecting the barbaric slave trade. The Palmerston Bill flamed hostility against Britain, already strong since the 1810s and British intervention during the Napoleonic Wars. In 1842, to restore its honor, Portugal signed an agreement with Great Britain to effectively repress the slave trade. In spite of this, the slave trade continued until the 1860s and, in a disguised way, between the territories of the Portuguese Empire until the 1960s.

The denunciation of white slavery allowed Portuguese political elites to place the country on the side of those who fight against what appears from now on as an intolerable phenomenon.

One of the first denunciations of white slavery in the Chamber of Deputies was made in April 1839 by Almeida Garrett, a writer and liberal politician. He is the author, accredited by Portuguese historians, of the preamble to the 1836 decree which seemingly banned the slave trade while presenting African colonies as a new Eldorado that would allow Portugal to be prosperous again. Almeida Garrett denounced emigration as “the first evil that castigates the Azores” and equates it to “white slavery trade.” Then, he invented the history of an alleged fight against the slave trade in Portugal and said that:

and here [the Parliament], where voices have risen so high against the black slavery, we will not consent to the protection of this other so scandalous slavery which, if it is different from the other slavery, is none the less more abominable, because it deals with beings more civilized than the others [Africans]. (Speech of Almeida Garrett at the Chamber of Deputies, Session of March 24, 1839, 215)

In his book called The Sounds of Silence, João Pedro Marques stressed that very few voices criticized slavery and slave trade in Portugal. Abolitionism was mainly the consequence of London’s pressure in the nineteenth century. In consequence, Almeida Garrett strongly exaggerated when he stated the voices that rose against the black slavery. In the case of the Azorean islands, slave trade was banned in 1832 (Caldeira 2017) – only 7 years before Almeida Garrett’s speech. Garret’s discourse implies a racist hierarchy that was used by the colonial powers at the end of the nineteenth century to legitimize their domination: Europeans have the burden to civilize the allegedly non-civilized.

Almeida Garrett’s rhetoric was repeated during the following decades. The denunciation of white slavery makes it possible to construct the illusion of a Portugal having abolished, out of its own free will, the slave trade, to certify the European belonging of Portugal (while certain Europeans leaders doubted it) and to affirm the inferiority of the Africans whom the Portuguese must govern in order to civilize them.
Protect Emigrants or Curtail the Right of Movement?

Overstating irregular emigration and the abuses suffered by emigrants had another objective: legitimizing a legislation that tried to refrain what became a right of all citizens, the right to freely leave one’s country. After the Liberal Revolution of 1820 and after the definitive break with absolutism in 1834, Portuguese rulers had to deal with a major contradiction. In 1834, the liberal principles seemed to have prevailed in Portugal. The 1826 Constitutional Charter, in effect from 1826 to 1828, from 1834 to 1836, and, finally, from 1842 to 1910, was granted by Dom Pedro IV (also Dom Pedro I in Brazil), the heir to the Portuguese crown and Emperor of Brazil. The Charter established the right to emigration: § 5 of article 145 guarantees that “anyone can remain in, or leave, the Kingdom, as they see fit, taking their possessions with them; as long as the due police procedures are followed, and no harm is caused to others.” This article was part of the liberal ideas, one natural right proclaimed during the “exit revolution,” as Aristide Zolberg (2007) called it. However, Dom Pedro did not really pretend to allow the Portuguese to leave their country freely. In fact, this article was only the translation of one article of the Constitution of the Brazilian Empire of 1824. The Emperor Dom Pedro wanted to encourage the arrival of white immigrants in Brazil and thus put forward this liberal principle, which was supposed to favor the arrival of European settlers.

Although the right to emigrate was included in the constitutional text of 1826, the majority of the Portuguese political class did not intend to respect Dom Pedro’s constitutional legacy and let the population circulate as it wished, preferring to keep an abundant workforce and to promote the colonization of African territories.

As Alan Dowty asserted, governments that do not want to respect the right of movement of their population argue “that controls on movement are in the best interest of the individuals themselves, whatever their own opinion of the matter” (Dowty 1987, 9). In Portugal, during the nineteenth century, several laws on passports, on the activities of emigration agents, or on ships transporting emigrants were published (Pereira 2013). Unlike many European countries (Torpey 2000), the passport was not abolished in Portugal, and all emigrants were required to have one. Governments presented the passport not as an obstacle to emigration – which it was – but rather as a guarantee for emigrants, subject as they were to various forms of exploitation. Emigration should be restricted – by way of legislation, regulatory devices, or administrative practices – for the emigrants’ own good. For the political elites, emigrants could not defend themselves alone, and, sometimes, they were even ready to voluntarily enslave themselves, accepting forms of indentured labor. Moreover, the idea that the Portuguese were ready to enslave themselves legitimated the restrictions on citizenship that were imposed throughout the nineteenth century. Only free men could be citizens, and, as a result, individuals willing to lose their freedom could not be citizens and vote (Ramos 2007).

The rhetoric of protection enabled the government to bypass constitutional limits. For the government, it was not a case of curtailing the right to emigration. It was, instead, a way of safeguarding the well-being of emigrants and, more generally, of
the population as a whole. While it is true that nineteenth-century emigrants were the victims of various forms of exploitation, the chief goal of the State’s actions was not their protection. Even the Commissioner of the Special Emigration police – organization created in 1896 for the purpose of fighting against illegal departures – recognized the contradiction of the Portuguese emigration policy:

the passport, a document that should serve as a protection and guarantee for all the country’s subjects abroad, has become a pretext for the exacting of an extremely burdensome tax, all the more revolting since it mostly falls on destitute individuals, as emigrants tend to be. Suffice it to recall that in no country in Europe, regardless of the regime to which the departure of national citizens is placed under, do the fiscal demands on this matter amount to even half of what is asked in Portugal. (Report of the General Commissioner of Emigration Police sent to the Secretary General of the Home office, 16 August 1905, Arquivo Nacional da Torre do Tombo, Ministério do Reino/Direcção-Geral da Administração Política e Civil, lot 5405, box 13).

Paradoxically, Portuguese authorities fueled a phenomenon – irregular and clandestine emigration – they pretended to fight, maintaining a legislation and regulation that contributed to boost departures without passports or with fake passports.

**Dictatorship, Clandestine Emigrants, and Smugglers**

**Emigration as a Threat**

In 1926, a military coup leads to the instauration of a dictatorship, the New State (Estado Novo) which is institutionalized in 1933. The New State is the regime, from 1834 onward, in which the right to emigration is least respected and in which legislation and practice concerning emigration movements are the most restrictive ones (Pereira 2013). In what constitutes a clear sign of the restrictions on the freedom of emigration, matters related to international mobility are gradually passed onto the hands of the political police forces (Ribeiro 1995). The issue of mobility is tied to that of subversion. Those who wish to leave Portugal or enter its territory are perceived as potential threats to order.

This animus toward emigration, however, did not prevent its numbers from reaching their highest point toward the end of the 1960s and in the early 1970s – 1970 being the peak year, with 183,205 people leaving, mainly illegally, the country.

In the beginning of the 1960s, France became the main destination and attracted more and more emigrants. This migration flow constituted a real problem for the dictatorship. Between 1957 and 1974, 900,000 Portuguese emigrated to France, about 10% of the population. Among them, 550,000 emigrated irregularly.

The dictatorship led by António de Oliveira Salazar considered Portuguese emigration to France as a political, economic, and military threat. The regime was scared that the Portuguese living in France would gain a political consciousness and would become communists. The only time Salazar mentioned publicly emigration to France, he stressed his fear. In 1964, the dictator confessed to a French newspaper
that “our great concern is that, especially in the Parisian suburbs where they are very badly accommodated, the Portuguese workers are handled by the Communist Party. The communists are the only ones taking care of them, facilitating their hiring and the formalities that their legal stay entails. They publish newspapers in Portuguese language. Thus a dreadful communist infiltration takes place” (L’Aurore, 9 October 1964, 11).

Also, according to the regime, emigration was a political problem because middle and large landowners wanted the State to prevent departures. Yet, these landowners represented an important support for the regime, in a country where 40% of the population still worked in agriculture in 1960. Finally, emigration was also a threat toward the Portuguese Empire in Africa. In 1961, colonial wars began in Africa. All young Portuguese males were called up for this colonial war. So, according to the dictatorship, emigration was hindering this military mobilization.

**The Paths of Clandestine Emigration**

For the Portuguese who wished to go to France, the best way was to leave the country illegally. Illegal emigration was often faster, safer, and cheaper than legal emigration. Emigration was not entirely prohibited, but a plethora of decrees and regulations had been enacted in order to restrict legal departures (Pereira 2012) and the administration was kafkaesque. Indeed, to apply for an emigration passport involved lengthy administrative procedures and many forms to fill. It could also be expensive because it was often necessary to pay bribes to bureaucrats. Sometimes passports were not given before more than a year of procedure. The legal emigration was often humiliating because the applicant had to ask for the support of a patron: the administrative process of passports’ concession was based on patronage, like many administrative matters in Portuguese rural society (Cutileiro 1971).

On the contrary, illegal migration was faster and less intimidating and did not require to fill dozens of forms. The oral contract proposed by recruiters and smugglers was easier to understand. Smugglers offered a clear commitment: a sum of money for the journey from one village to a specific place in France. These procedures reduced the uncertainties of emigration. It was part of a network of acquaintanceship and trust. Many migrants left to join their relatives abroad, relatives who welcomed them, accommodated them, and helped them in their first steps into an unknown country. Illegal immigration put the migrant in the center of a migration chain, while legal emigration, through employment contracts, often reduced migrants to a mere workforce, isolating them from their families and their relationships.

However, the relationship between candidates for illegal emigration and smugglers came with ambiguities and power relations. Authorities and newspapers, censured and controlled by the dictatorship, presented smugglers as scapegoats, and their action was assimilated to that of modern slavers. Authorities repeated that smugglers were only guided by profit without any scruple and that they abandoned their “clients” in the middle of the mountains, after robbing all their goods. Clandestine migrants were erected as victims and not as actors because it
allowed the dictatorship to hide their agency and the political dimension of their departure. Again, as in the nineteenth century, illegal emigration and human trafficking were blurred. This migration wave was often defined as “a new modality of white slavery.” This rhetoric allowed the State to claim the duty to protect emigrants from smugglers, but the smugglers were not all tricksters as the propaganda of the dictatorship claimed. They were no heroes either (Pereira 2010). Their main purpose was not to release Portuguese from dictatorship and poverty, unlike what some of them claimed (Morais 2007). The smugglers were paid for the service they delivered and they took advantage of the contradictions of the emigration policy.

Despite the dictatorship’s will to reduce them to victims, the migrants were not as weak as the authorities claimed. To reduce the risks linked to the clandestine journey, a contract was often made between smugglers and illegal immigrants. If the migrants were arrested and if they did not denounce the smugglers to the police, the next time smugglers would not charge them, and they would provide them their services for free. A system had been established and achieved what Adam Seligman (2001) calls the “confidence”: a relation based “on the ability to impose sanctions and the knowledge that one’s partner to an interaction also knows that sanctions will be imposed if he or she fails to live up to the terms of an agreement” (Seligman 2001, 39). Before leaving, the emigrants only paid half the cost of the trip. They used to give to their families half of a picture: their own portrait. And they kept the other half with them, during their travel. If they succeeded and made it to France, they would send to their families half of the picture they kept. Receiving the piece of the picture, their family knew they had to pay what was left of the smuggler’s retribution. Migrants had other means to be sure that smugglers would not cheat them: they could denounce them to the police or they could deter other would-be emigrants to employ their services. The “reputation” was an essential capital for smugglers. Those considered unreliable would lose opportunities. The smuggler who would deceive migrants would not be able to stay in this business for a long time: he would surely get himself denounced to the political police by the deceived migrants or even by other smugglers who wanted to protect their reputation (Pereira 2014).

Smoke and Mirrors

If 550,000 Portuguese left illegally, it was not only the result of a failure of the Portuguese State, unable to control its borders. Illegal emigration was a central point in a strategy whose goal was to conciliate economic development and the support of the declining rural and conservative elites. As we have seen, traditionally, landowners and other notables asked the State to stop emigration. In order to maintain their support, the government enacted a plethora of decrees and regulations to restrict legal and illegal departures (Pereira 2012). A few months after the Angolan’s revolt, in February 1961, a decree-law told that clandestine emigration was henceforth a crime and not a simple offense any more. The authorities also championed various press campaigns against smugglers, presenting them as evil and ensuring the will of the political police to jail them.
But inside the dictatorship, some individuals defended that the economy should be opened up to Western Europe and liberalized (Andresen 2007). For some of these reformists, economic growth was a way to legitimate the dictatorship. Emigration was a piece of the modernist strategy. The exit of low or unskilled workers permitted the increase of the productivity and the mechanization of the economic structures. The emigration also channeled foreign capital through remittances, remittances essential for the modernization of the economy and also for buying weapons (mainly from France and from Germany) for the colonial wars.

If Salazar had several reformists in his governments, until the end of the 1960s, he kept prudent economy policies that did not cause trouble with the conservative currents (Rosas 2012). The emigration policy of Salazar’s government was a game of “smoke and mirrors” (Massey et al. 2003). To use Michel Foucault’s expression, the dictatorship led a “differential management of illegalities” (Foucault 1975): “to perpetuate itself,” the dictatorship tolerated “spaces where the law can be ignored or violated” (Fischer and Spire 2009, 8).

The Salazarist government only tried to avoid the problems that emigration could carry and to get as many benefits (political, economical, etc.) as it could take. Illegal migration minimized the political risks of the migration in France and slowed down the separation between the emigrants and Portugal. Illegal migration selected and weakened the migrants. The goal of the emigration’s legislation and of the low supervising of the borders was not to stop all illegal emigration. Above all, it was to force the migrants to contract the services offered by recruiters and smugglers and to endure a physically hard trip. This modality of migration consequently restricted the departures to the healthy men. Until the mid-1960s, illegal migrants had to endure a long and dangerous trip: they had to cross the Portugal-Spain border and then the whole of Spain; they had to hide in trucks or in cars, to walk at night, and then, finally, to cross the border between Spain and France, often in the mountainous area of the Pyrenees (Goienetxe 2017). Few women or children could complete the illegal journey toward France. This caused family separations, which was one of the main goals of the authorities. The government wanted to separate the families for two reasons. First, in France, the migrants were men, alone, who emigrated in order to send money to their families and to invest in Portugal. The separation of the families was a key for the dictatorship to continue channeling remittance flow. Secondly, migrants feared that they could not return back home to visit their relatives and friends if they were denounced as communists. Many migrants thought that the Portuguese political police was present in France and had a powerful network of informers. Therefore, the majority of migrants stayed far from trade unions, political parties, or any protest.

Nevertheless, this strategy was not always efficient and was disrupted in 1964–1965. In April 1964, the French government decided that Portuguese who enter France illegally could be, later, regularized. It was an encouragement for many Portuguese who knew they could find an employment even if they had entered France illegally. Then, in 1965, Spanish authorities also decided to tolerate the transit of Portuguese illegal immigrants and did not chase them anymore. In fact, until 1965, the Portuguese political police mainly relied on the action of the Spanish
police who chased Portuguese illegal migrants who had no passport, put them in jail, judged them, and expelled them to Portugal (Pereira 2008). Until 1965, the whole Spaniard territory was a border for Portuguese illegal migrants. This surveillance, even if it were not very efficient because Spanish policemen were often lazy and corrupted, perfectly suited the Portuguese dictatorship that handed responsibilities over his neighboring country, without warning him. Firstly, the Spanish police was doing the task that the Portuguese police should have done: arrest illegal migrants. In consequence, the political police did not need to send more policemen to the borders and continued to fight against its main targets: the opposition and anticolonial militants. Secondly, the Spanish police was making it difficult for the Portuguese peasants to emigrate. Therefore, only men could emigrate and they ran into debts to pay the smugglers networks.

After 1965, illegal emigration became less dangerous and cheaper. At the end of the 1960s, the emigration flow to France increased considerably, and the proportion of women and children became larger.

In 1968, the successor of Salazar, Marcelo Caetano, changed the emigration policy that was now connected with the modernization policy and liberalized. Illegal emigration was no longer a crime and amnesties for the illegal migrants were granted. Nevertheless, as a consequence of the continuation of the colonial wars, the emigration was not liberalized as in the democracies. If Portugal did not need its peasants anymore, it needed soldiers. Illegal migration continued in a large proportion, but migrants did not need to risk their lives anymore to enter France.

Epilogue: Human Trafficking, Democracy, and Europeanization

With the Carnation Revolution in 1974, for the first time, all Portuguese could emigrate as they wished. The leaders of the Portuguese democracy promise to build a country where it will not be necessary to leave. Emigration becomes linked with dictatorship and the colonial wars and seems to belong in the past. Nevertheless, after 1974, the migratory flow did not dry up. Nor did illegality because many immigration countries closed their border in 1973–1974, after the economic crisis (Laurens 2009). Migratory flows also were more diversified: France did not receive the majority of emigrants as between 1961 and 1974. The Portuguese went also to Luxembourg, Switzerland, Great Britain, or Spain.

In the 1980 and early 1990s, many Portuguese worked abroad illegally, but not as victims of human trafficking. Before Portugal’s entry into the CEE (1986), the end of the transition period for the free circulation (1992) and later when it became part of the Schengen space (1995), many Portuguese worked illegally in France and other European countries.

This illegal work is part of the uncertainties linked to the European construction and the establishment of the free movement of workers as well as the freedom to provide services in the European Union. One of the first cases concerning the debate – which is still very keen today within the European Union – on posted workers thus involved a Portuguese company, subcontractor of French companies working on the construction of a railway line in France. The French authorities considered that it was
an illegal introduction of immigrant workers. These workers entered France as tourists but established a salaried activity there, without obtaining the necessary authorizations. In addition, they were paid according to Portuguese standards, well below the French minimum wage. The Portuguese company – *Rush Portuguesa* – considered that its activity was legal, acting within the freedom to provide services. The European Court of Justice, seized by the Portuguese company, sided with *Rush Portuguesa* (Blanpain 2008, 350). However, the vagueness around the situation of the Portuguese posted workers still persisted for some years. In 1996, the European directive on posted workers (96/71/EC) subsequently established a legal framework, setting in particular the obligation to respect the minimum wage established in the country of establishment.

Despite this directive, some Portuguese workers have been abused while working abroad: non-respect of working conditions, hours working well above those fixed by law, salaries lower than the minimum wage of the country where they worked, exaggerated cost of a sometimes precarious accommodation, etc. The media – mainly Portuguese – have repeatedly reported situations of human trafficking: in 2007, 2011, or 2016, Portuguese newspapers referred that several Portuguese workers engaged in Spain, in agriculture mainly, were forced to work long hours and were not free of their movement.

But, as for the nineteenth century, these cases – sometimes presented as “new slavery” by the press or trade unions – seem rather isolated and should not be exaggerated. In 2015, Portuguese authorities have identified ten Portuguese victims of human trafficking abroad (Observatório do Tráfico de Seres Humanos/Ministério da Administração Interna 2017, 18). In fact, Portuguese emigrants often join relatives who help them to find housing and work. Although the construction sector and the opacity of subcontracting favor certain abuses, workers who go to work as posted workers benefit from better pay conditions than if they stayed in Portugal (Monteiro and Queirós 2016).

The democratization, the Europeanization, and the economic growth of Portugal has also favored the development of immigration in the country, a transition that is also observed in Spain and Italy. In 2009, Portugal had about 450,000 foreigners. A large proportion of immigrants come first from former African colonies (Cape Verde primarily) and then, since the 1990s, from Brazil (Marques et al. 2005). Inserted into the former imperial migration area (Cahen and Morier-Genoud 2012), these migrations are very rarely part of human trafficking networks. For example, several agreements signed between Brazil and Portugal since the 1970s allow Brazilians to come to Portugal without any travel visa. So, most of the migrants from the former colony came legally in Portugal. But most of them remained illegally ( overstayers), until a regularization process led by Portuguese authorities (as in 1992, 1996, and 2001, for instance).

For other migration waves from Eastern Europe (especially in the 1990s and 2000s), the Indian Peninsula, or China, some studies mention human trafficking (Peixoto 2009) but do not always separate clearly smuggling and human trafficking. Peixoto showed that in Eastern European countries, migrants, many of them with high level of education, bought “migration package” including a short-term tourist visa, travel arrangements, and a contact person in Portugal. But “smuggling” cases very often became ‘trafficking’ ones, since elements of the networks operating in
well-defined areas on the territory were responsible for extorting immigrants” (Peixoto 2009, 193). Nevertheless, these illegal migrants benefited from the tolerance of the Portuguese authorities, especially in the 1990s and early 2000s, in a period of strong economic growth, low unemployment, and construction of many infrastructures (Lisbon World Exposition in 1998, etc.).

The various international reports concerning human trafficking do not consider Portugal to be particularly concerned. For example, the statistical data published by Eurostat only mention 20 registered victims coming into contact with the authorities between 2010 and 2012. A lot less than Spain with 1964 cases in the same period. The percentage of identified and presumed victims of human trafficking is only 0.2 per 100,000 inhabitants, one of the lowest in Europe (Eurostat 2013). Portuguese reports also indicate that human trafficking is far from being a massive phenomenon in the country. In 2015, there were 108 victims of human trafficking in Portugal.

One might think that these reduced data are the consequence of the weak commitment of the Portuguese authorities in the fight against the human trafficking. But that does not seem to be the case. Indeed, like other Western countries, Portugal has undertaken fight against human trafficking. Portugal adopted the Palermo Protocol in 2004 and clarified its human trafficking legislation with two laws dating from 2007. A national plan to prevent and combat trafficking in human beings was launched in 2007 (until 2010), and an Observatory on Trafficking in Human Beings (Observatório do Tráfico de Seres Humanos), under the authority of the Ministry of the Interior (Home office), was created in 2008. The goal of this observatory was “to fight the opacity which characterizes the trafficking in human beings phenomenon and thus, through a better understanding” (http://www.otsh.mai.gov.pt/en/InPortugal/Pages/default.aspx). Two other national plans against trafficking in human beings were adopted (2011–2013, 2014–2017).

Unlike other Southern European countries (Spain, Italy, Greece), currently, Portugal is only marginally a transit country for irregular migration from Africa or Asia. Its seacoasts are not turned toward these continents from where populations try to flee wars or dictatorships or seek to get a better life. Nevertheless, Portugal is sometimes a place of passage for South American, African, or Asian populations seeking to live in Europe. After the regularization of their administrative situation in Portugal, some of these migrants go to another European country. Portugal only represents for part of these migrants a gateway to the Schengen area. Moreover, the economic crisis that has affected the country since 2008 has reduced the attractiveness of Portugal and has led to the departure of some migrants (Brazilians returning to their country, migrants trying their luck in another European country). And because of the significant rise in unemployment, thousands of Portuguese have also chosen to emigrate. Portugal thus remains both a country of emigration and immigration, a singularity that attests its “semi-peripheral” position in the world system (Santos 1993). This “semi-peripheral” position is a singularity that we have seen in the field of human trafficking. Until the nineteenth century (and even the twentieth century), the Portuguese authorities were responsible for massive human trafficking, mainly in Africa. And, in the same time, a considerable part of the Portuguese who left the country did it illegally, in search of a better life elsewhere.

Abstract
The aim of this chapter is to clarify the contours of the definition of slavery. Special attention is placed in understanding the blurred lines between the international legal definitions of slavery and of other exploitative practices, including the practices labeled as similar to slavery, as well as servitude and forced labor, and their relationship with trafficking in persons. A distinction is subsequently made between the international legal definition contained in the 1926 Slavery Convention adopted by the League of Nations and sociological ones developed by various scholars such as K. Bales, O. Patterson, and A. Honoré. Elements included in these definitions are analyzed and discussed in light of the 1926 definition of slavery. In this respect, the recent reorientation of international attention toward (forms of) contemporary, modern, or modern-day slavery is discussed, thus concluding that it offers a way to avoid careful scrutiny on whether exploitative practices fit the 1926 legal definition of slavery.

The International Law on Slavery

While prohibitions of slavery have been introduced by every country in the world in the last three centuries, this social phenomenon in all its multiple manifestations has been practiced for thousands of years in the majority of the civilizations in human history (Hellie 2018), with major differences existing among the various systems of slavery (Quirk 2008). However, the abolitionist ideal that gained momentum in the eighteenth century and that shaped the international efforts aimed at eliminating the practice was initially aimed at – and, therefore, shaped on – eliminating the brutality of the Transatlantic Slave Trade that flourished from the sixteenth to the nineteenth century and involved between 10 and 12 million enslaved Africans that were transported to the Americas.

A Declaration on the slave trade adopted during the Congress of Vienna of 1815 represents the first international condemnation in this field. It was only a century later, however, that reference to the suppression of both slavery and the slave trade was made by the 1919 Treaty of St-Germain-en-Laye. Then, after World War I, the League of Nations promoted the adoption on 25 September 1926 of the Slavery Convention, the treaty that contains the first and only international definition of slavery in international treaty law. Well before the affirmation of the international protection of human rights – a concept that only emerged after the end of World War II – the fight against slavery and the slave trade propagated the idea of equal dignity and the intolerability of different individual statuses or treatments based on law or customs.

However, the prohibition of slavery was also to be subsequently included in international human rights; humanitarian, criminal, and human trafficking law instruments; as well as the international law of the sea. Article 4 of the 1948 Universal Declaration of Human Rights contains the first reference to slavery in international human rights law, which was, however, to be followed by an inclusion in treaties adopted both at the universal and regional and subregional level. The former include Article 8 of the 1966 International Covenant on Civil and Political Rights (ICCPR) and Article 11 of the 1990 International Convention on the Protection of the Rights of all Migrant Workers and Members of their Families (ICMW); and among the latter ones, there are Article 4 of the 1950 European Convention on Human Rights (ECHR), Article 5 of the 2000 Charter of Fundamental Rights of the European Union, Article 5 of the 1981 Banjul African Charter on Human and People’s Rights, Article 6 of the 1969 American Convention on Human Rights, and Article 10 of the 2004 Arab Charter on Human Rights.

As regards international humanitarian law, the prohibition of slavery was firstly introduced in the 1863 Lieber Code. In the context of non-international armed conflicts, Art. 4.(2). (f) of the 1977 Additional Protocol II to the 1949 Geneva
Conventions of 12 August 1949 on the Protection of Victims of Non-International Armed Conflicts prohibits slavery and the slave trade in all their forms against persons who do not take a direct part or who have ceased to take part in hostilities. Curiously, the Geneva Conventions and Protocol I on international armed conflicts do not contain a prohibition of slavery and the slave trade. However, the recent study on customary international humanitarian law drafted by the International Committee of the Red Cross (ICRC) includes a reference to slavery and the slave trade in all their forms in its Rule 94.

In addition to this, slavery figures among the forms of exploitation specified in the definition of trafficking in persons provided by Article 3. (a) of the 2000 Protocol to Prevent, Suppress, and Punish Trafficking in Persons, Especially Women and Children supplementing the United Nations Convention against Transnational Organized Crime (CTOC), Article 4 of the 2005 Council of Europe Convention on Action against Trafficking in Human Beings, and Article 2.(3) of Directive 2011/36/EU of the European Parliament and of the Council on preventing and combating trafficking in human beings and protecting its victims. The connection between the concepts of slavery and the one of human trafficking has certainly reinvigorated the interest in clarifying the contours of the definition of the former practice. In addition to this, the most important treaty in the field of the law of the sea, namely, the 1982 United Nations Convention on the Law of the Sea (UNCLOS), prohibits at Article 99 the transportation of slaves on board any ship flying the flag of a State Party and claims that slaves taking refuge on board any ship are ipso facto freed and at Article 110 guarantees a right of hot visit on the high seas when there is “reasonable ground for suspecting that [...] the ship is engaged in the slave trade.”

While the term “slavery” is generally used in international slavery and human trafficking law, as well as in international human rights, in humanitarian law, and in the law of the sea, the concept of “enslavement” is instead used in international criminal law. According to Article 7 of the Rome Statute of the International Criminal Court (ICC), if enslavement is committed as part of an intentional widespread or systematic attack directed against the civilian population, it constitutes a crime against humanity. The latter provision also defines enslavement in the same way in which slavery is defined in the 1926 Slavery Convention, with the inclusion of a reference to trafficking as the process that might lead toward enslavement. The latter practice is also specifically included among the acts constituting crimes against humanity in the statutes of some ad hoc tribunals, such as the 1945 Charter of the International Military Tribunal of Nuremberg (Article 6.c), the 1946 Charter of the International Military Tribunal for the Far East (Article 5.c), and the 1993 and 1994 Statutes of the International Criminal Tribunal for Ex-Yugoslavia and Rwanda (Articles 5.c and 3.c), the 2000 Statute of the Special Court for Sierra Leone (Article 2.c) and the 2003 UN-Cambodia Agreement Concerning the Prosecution of Crimes Committed During the Period of Democratic Kampuchea (Article 9).

Overall, the prohibitions of slavery and the slave trade in times of both peace and war are unanimously considered to be customary rules of international law, and they have also attained the level of peremptory norms of international law (jus cogens rules), as recognized by international bodies (Human Rights Committee 1994; International
Law Commission (1963) and scholars (Bassiouni 1991, 1999; Cassese 2005; Lenzerini 2000; Scarpa 2008). Moreover, the International Court of Justice (ICJ) in the 1970 Barcelona Traction Case considered the prohibition of slavery as an obligation erga omnes. No attempt has been made so far “to investigate whether or not the 1926 slavery definition fundamentally corresponds and is applicable to the jus cogens rule of international law that prohibits slavery. The contours of such a peremptory norm prohibiting slavery are in fact determined by two elements, that have so far not been accurately investigated: the diuturnitas and the opinio iuris sive necessitatis. The second controversial issue pertains to understanding whether or not the interpretation of slavery’s legal definition under both treaty law and jus cogens law fully overlap and if not, clarifying the eventual differences” (Scarpa 2018: 18).

Despite all these achievements, the international law on slavery still faces many challenges, including those related to the interpretation of the definition of slavery included in the 1926 Slavery Convention: the blurred lines between slavery and other exploitative practices, including the practices similar to slavery, servitude, and forced labor, and its relationship with trafficking in persons. In this respect, the reorientation of international attention toward (forms of) contemporary, modern, or modern-day slavery has to a great extent avoided a deeper look at the definitional boundaries of the practice of slavery and has allowed dealing with serious exploitative practices without carefully verifying whether they fit the 1926 definition of slavery (Scarpa 2018).

The Legal Definition of Slavery Included in the 1926 Slavery Convention

According to Article 1.(1) of the 1926 Slavery Convention slavery is: “[T]he status or condition of a person over whom any or all the powers attaching to the right of ownership are exercised.” This definition was considered as being “accurate” and “adequate” by the 1951 Report of the ad hoc Committee on Slavery of the United Nations (1951:59), and, for this reason, it was also subsequently included in Article 1 (1) of the 1926 Slavery Convention as amended by the 1953 Protocol and in Article 7. (a) of the 1956 United Nations Supplementary Convention on the Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery.

However, a controversial issue with reference to slavery concerns the way in which the 1926 definition is to be interpreted. Scholars generally agree that the definition of slavery included in Article 1.(1) of the 1926 Slavery Convention applies not only to de jure slavery but also to the de facto one, thus justifying the reference in the text to both statuses and conditions of individuals (Lenzerini 2000; Allain 2009a). However, disagreement exists on whether such definition of slavery covers all or only some of the contemporary exploitative practices that exist today in the world. In this respect, it is worth emphasizing first of all that Article 2 requires States Parties to progressively abolish slavery “in all its forms” and that the first Report of the Temporary Slavery Commission appointed by the Council of the League of
Nations to study the matter included many de facto practices, considered as “analogous to slavery” (Scarpa 2008).

The core element of the definition is the reference to the “powers attaching to the right of ownership.” In this respect, Lenzerini (2000) claims that:

The right to ownership is traditionally composed of two powers that the owner is entitled to exercise over his/her property: 1) the power to dispose (which include the right to alienate) and 2) the power to enjoy (which includes the right to exclude others from enjoying). Thus when Article 1 of the 1926 Convention indicates “the powers attaching to the right of ownership” this is a clear reference to these powers. In addition, the locution “any or all of the [se] powers”, implies that the definition in point covers not only situations where a perfect right of ownership exists, but also those human relationships characterised by the exercise by one person over another of only one of the two powers that compose the right of ownership itself.

The concept of property that rests at the basis of the 1926 definition of slavery can then be interpreted by making reference to the Code Napoléon, which constitutes the legal basis of many modern civil codes. Therefore, according to Lenzerini (2000) as long as any of the two abovementioned powers attaching to the right of ownership are exercised over an individual, the definition of slavery contained in the 1926 Slavery Convention is broad enough to cover contemporary practices such as serfdom, forced labor, bonded labor/debt bondage, the exploitation of migrant workers, trafficking in persons, forced prostitution and sexual slavery, forced marriages and the sale of wives, child labor and child servitude, apartheid, colonialism, trafficking in human organs, and incest. All these exploitative practices had been taken into consideration during its 30 years of activity by the United Nations Working Group on Contemporary Forms of Slavery (UNWGCFS) – a group appointed in 1974 within the Sub-Commission on Prevention of Discrimination and Protection of Minorities (from 1999 known as the Sub-Commission on Promotion and Protection of Human Rights) that ceased to exist in 2006, when the Human Rights Council decided to substitute it with a Special Rapporteur on Contemporary Forms of Slavery. Their consideration by the UNWGCFS had, however, generated considerable debate among academics in this field.

The 1926 definition of slavery is also analyzed in the important report entitled “Abolishing Slavery and its Contemporary Forms” commissioned by the UNWGCFS to Weissbrodt and Anti-Slavery International (2002). While recognizing that the definition of slavery had caused great “controversy since the beginning of the abolition process,” the Weissbrodt and Anti-Slavery International’s Report recognizes that a broad interpretation of the definition of slavery, including “all social injustices or human rights violations” would be meaningless and affect the effectiveness of the fight against slavery. Therefore, the Report indicates three criteria that should inform the analysis of the practices, so as to be able to assess whether they constitute slavery or not. These three criteria are:

i. The degree of restriction of the individual’s inherent right to freedom of movement

ii. The degree of control of the individual’s personal belongings
iii. The existence of informed consent and a full understanding of the nature of the relationship between the parties

On these premises, the Weissbrodt and Anti-Slavery International’s Report concludes that some practices taken into consideration by the UNWGCFS do not fall within the category of slavery: this is, for instance, the case of incest, considered as a serious violation of children’s rights but not a form of slavery, or of the phenomenon of mail-order brides that, nonetheless, has to be scrutinized to avoid the possibility of severe forms of exploitation or abuse of women who might find themselves in a situation of vulnerability. As regards apartheid and colonialism, the Report underlines that they “may not fall within the ambit of the international conventions abolishing slavery.”

Allain (2009a) criticizes the conclusions reached by the Weissbrodt and Anti-Slavery International’s Report affirming that the Report contains “an interpretation of the term” slavery “as being so all-encompassing as to render it meaningless in law.” While Lenzerini makes reference to the Napoleon Code, Allain – as well as, previously, Lassen (1988) – uses the Roman law concept of *dominica potestas* and takes into consideration a 1953 Memorandum of the United Nations Secretary-General, enumerating the following six different characteristics:

i. The individual of servile status may be made the object of a purchase.

ii. The master may use the individual of servile status, and in particular his capacity to work, in an absolute manner, without any restriction other than that which might be expressly provided by law.

iii. The products of labor of the individual of servile status become the property of the master without any compensation commensurate to the value of the labor.

iv. The ownership of the individual of servile status can be transferred to another person.

v. The servile status is permanent, that is to say, it cannot be terminated by the will of the individual subject to it.

vi. The servile status is transmitted ipso facto to descendants of the individual having such status (Secretary General of the United Nations 1953).

Such characteristics do not have to be cumulatively fulfilled, but when one or more of them are to be found in a relationship among individuals, the indicia of slavery are manifested (Allain 2009a). While Allain dedicated much of his work to studying the Slavery Convention’s drafting history, his methodology fails when he refers only to Articles 31–32 on the interpretation of treaties included in the 1969 Vienna Convention on the Law of Treaties. According to Article 4 of the Vienna Convention, the treaty and its rules cannot be interpreted retroactively and they bind only its States Parties (Scarpa 2018).

International courts have also recently contributed to the debate on the interpretation of the 1926 definition of slavery. The first fundamental analysis of the 1926 definition of slavery was conducted in 2001 by the International Criminal Tribunal for Ex-Yugoslavia (ICTY) in the *Kuranac* case, followed in 2008 by the Court of
Justice of the Economic Community of West African States (ECOWAS) with *Hadijatou Mani Koroua v. Niger*. The European Court of Human Rights (ECtHR) has, however, been the most productive tribunal with a series of judgments, including *Siliadin v. France* of 2005, in which the Court interprets restrictively the concept of slavery, making reference to legal ownership and *M. and Others v. Italy and Bulgaria* of 2012, in which it revisited and broadened its initial approach.

Finally, it is worth mentioning the 2012 *Bellagio-Harvard Guidelines on the Legal Parameters of Slavery* that were unanimously adopted by some renowned experts in this field as a way to offer guidance on the interpretation of the 1926 definition of slavery. The Guidelines offer some hints aimed at reducing the vagueness of the 1926 slavery definition, including the reference to control, a final aim of exploitation for the offense, and the deprivation of liberty (Guideline 2) and the indeterminate duration of the practice in the eyes of person subjected to it (Guideline 3). While some of the mentioned elements had already been taken into consideration by the Weissbrodt and Anti-Slavery International’s Report, the fact that the offense of subjection to slavery is connected with the intent of exploitation raises doubts since this reading of the 1926 slavery definition adds an element that is not included in the original text of the 1926 definition (Scarpa 2014).

Therefore, while various attempts have been made in clarifying the *contours* of the nebulous definition of slavery included in the 1926 Slavery Convention, a certain inconsistency in the approach adopted by scholars and international tribunals is visible, with also some attempts aimed at proposing very broad interpretations of the concept. In this respect, the fact that the concept of slavery relies on the idea of property rights borrowed from civil law transferred into criminal law contributes to these interpretative problems and issues. However, the risk of dilution of the concept of slavery is also to be taken into consideration, keeping in mind that there is a need for a well-defined and strictly interpreted offense of slavery under penal law (Decaux 2009).

---

**The Blurred Boundaries Between the Legal Definitions of Slavery, the Practices Similar to Slavery, Servitude, and Forced Labor**

In 1956, the United Nations adopted a Supplementary Convention on the Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery. According to Article 1 of the Supplementary Convention, States Parties shall adopt measures aimed at abolishing “progressively and as soon as possible” the statuses or conditions of debt bondage, servitude, and some institutions and practices affecting women and children. Debt bondage – or bonded labor, as it is known in Asian countries – is defined by that provision as “the status or condition arising from a pledge by a debtor of his personal services or of those of a person under his control as security for a debt, if the value of those services as reasonably assessed is not applied towards the liquidation of the debt or the length and nature of those services are not respectively limited and defined.” In practice, persons in debt bondage repay a loan with services, whose length, value, and nature have not been specified, performed by the debtor or by another person. Serfdom is instead defined as
“the condition or status of a tenant who is by law, custom or agreement bound to live and labor on land belonging to another person and to render some determinate service to such other person, whether for reward or not, and is not free to change his status.” Finally, Article 1. (c) and (d) of the 1956 Supplementary Convention is aimed at abolishing:

(c) Any institution or practice whereby: (i) A woman, without the right to refuse, is promised or given in marriage payment of a consideration in money or in kind to her parents, guardian, family or any other person or group; or (ii) The husband of a woman, his family, or his clan, has the right to transfer her to another person for value received or otherwise; or (iii) A woman on the death of her husband is liable to be inherited by another person.

(d) Any institution or practice whereby a child or young person under the age of 18 years, is delivered by either or both of his natural parents or by his guardian to another person, whether for reward or not, with a view to the exploitation of the child or young person or of his labour.

The prohibition of the two statuses and conditions similar to slavery – namely, debt bondage and serfdom – and of the two institutions and practices similar to slavery affecting women and children included in the 1956 Supplementary Convention is to be considered as an addition to the ones included in the 1926 Slavery Convention (Scarpa 2008). However, no clarification is included in the text of the treaty detailing the legal boundaries existing among these various legal concepts and the one of slavery. Article 1 of the 1956 Supplementary Convention only clarifies that they are to be abolished “whether or not they are covered by the definition of slavery contained in article 1 of the Slavery Convention,” thus confirming that they overlap, without describing the contours of these additional statuses, conditions, institutions, and practices.

The term servitude and its relationship with the concept of slavery also deserve a careful look. While in fact the Preamble of the 1956 Supplementary Convention mentions the prohibitions of slavery and servitude included in Article 4 of the Universal Declaration of Human Rights (UDHR), Article 7. (b) of the same treaty only defines the concept of the “servile status” of a person, making reference to debt bondage, serfdom, and the institutions and practices affecting women and children. Moreover, no international treaty defines the term “servitude,” even if the latter is widely used in international human rights conventions, including, at the universal level, Article 8.2 ICCPR and Article 11.1 ICMW and, at the regional level, Article 4.1 ECHR, Article 5.1 of the Charter of Fundamental Rights of the European Union, Article 6 of the 1969 American Convention on Human Rights – only prohibiting involuntary servitude though – and Article 10.1 of the 2004 Arab Charter on Human Rights. It is interesting to note that during the drafting process of the Universal Declaration of Human Rights, the Commission on Human Rights had recommended the addition of the adjective involuntary as a way to better qualify the term servitude. However, this proposal was not accepted by the third Committee of the General Assembly of the United Nations, as it was believed that it was necessary to eliminate servitude whether it was voluntary or not and to avoid offering to masters the possibility of arguing that their victims had accepted such a condition in a voluntary way.
However, the contours of such a concept and its relationship with the one of slavery remain vague. For instance, Nowak (2005) concludes that the Travaux Préparatoires of the ICCPR clarify that slavery has to be intended in its traditional sense, as implying the “destruction of one’s juridical personality,” while servitude had to be associated with “dominance and degradation.” Allain (2009b) argues instead that the absence of a clear reference to servitude in the 1956 Supplementary Convention is due to the unwillingness of negotiating States to “go as far as the Universal Declaration of Human Rights” in prohibiting servitude and that the latter concept only corresponds with the four institutions and practices prohibited by the 1956 Supplementary Convention. Finally, a jurisprudential interpretation comes from the European Court of Human Rights that in Siliadin v. France defined servitude as being “an obligation to provide one’s services that is imposed by the use of coercion, and is to be linked with the concept of ‘slavery’,” thus determining a gradation between the two practices.

Another complex relationship is the one between the concepts of slavery and forced or compulsory labor. Forced or compulsory labor, as defined by Article 2.(1) of the International Labour Organization (ILO) Convention n. 29 concerning Forced or Compulsory Labour adopted in 1930 and Article 1.(3) of the Forced Labour Protocol adopted in 2014, is “all work or service which is exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily.” The original main aim of the ILO Convention n. 29 was to fight against forced or compulsory labor imposed by States, and in that respect, the reference to a “penalty” was more easily understandable; however, Article 4.(1) adds that States Parties shall not permit the imposition of forced or compulsory labor “for the benefit of private individuals, companies or associations.”

The ILO further clarifies that this definition of forced or compulsory labor contains two main elements, namely, the menace of a penalty and the involuntariness. The interpretation provided by the ILO of these two elements has recently seen an evolution and a better specification. The menace of a penalty was originally associated by this international organization with psychological or physical coercion and the involuntariness with the idea that individuals “perform some work that they would otherwise not have accepted to perform at the prevailing conditions” (Belser et al. 2005). More recently, the ILO proposed to interpret the terms menace of a penalty as including:

penal sanctions and various forms of direct or indirect coercion, such as physical violence psychological threats or the non-payment of wages. The “penalty” may also consist of a loss of rights or privileges (such as promotion, transfer, or access to new employment). (ILO 2016)

Moreover, in interpreting the term involuntariness, the ILO (2016) currently focuses on the freedom of workers to enter into a working relationship with “free and informed consent” and the associated right to freely decide to leave that employment whenever they feel it is appropriate.

As clarified supra, in its jurisprudence, the European Court of Human Rights has proposed a gradation approach to explain the relationship existing within Article 4
ECHR between slavery and servitude and it has extended it to forced or compulsory labour too. Therefore, forced or compulsory labor is the entry point for violations of such provision, servitude implies an obligation to provide services under a situation of coercion – thus positioning it in between forced or compulsory labor and slavery – and the latter is the most abusive practice among the three.

The Sociological Definitions of Slavery

Paralleling the legal debate on the 1926 definition of slavery, sociologists and anthropologists have examined the issue of contemporary, modern, or modern-day slavery and have proposed multiple definitions based on the characteristics of the practices identified through their fieldwork. Among the scholars that dedicated much work to studying and defining slavery in its contemporary forms, Kevin Bales figures prominently. He adopted a first definition of slavery in 1999, and he, subsequently, amended it in 2012 (Bales 2012). The first definition proposed by Bales stated that “Slavery is the total control of one person by another for the purpose of economic exploitation” and a slave is “a person held by violence or the threat of violence for economic exploitation” (2012). The reference to total control in the definition is misleading, since one could speculate on the situation of those slaves who maintain, at least partial agency. Moreover, the concept of violence is vague, since no explanation is provided on whether physical, psychological, sexual, or other forms of violence are also included. Finally, the recognition that slavery is only connected with economic exploitation leaves out of the definition all those cases in which the slaveholder has other aims.

Therefore, Bales amended this first definition in 2012 to better clarify some of these elements, so that slavery is:

the control of one person (the slave) by another (the slaveholder or slaveholders). This control transfers agency, freedom of movement, access to the body, and labor and its product and benefits to the slaveholder. The control is supported and exercised through violence and its threat. The aim of this control is primarily economic exploitation, but may include sexual use or psychological benefit.

This definition broadens the scope of the concept of slavery while keeping a fundamental connection between the practice and violence (or its threat) and an important – albeit not absolute – focus on economic exploitation. If compared with the 1926 legal definition of slavery, it looks interesting to note how Bales substitutes the concept of ownership (and associated rights) with the one of control, thus avoiding the (legal) discussions based on the boundaries of the civil law concept of property and on its associated rights, its use in the framework of a relationship between individuals, and the distinction between de jure and de facto situations. Nonetheless, the concepts of violence and of its threat remain undefined and it is unclear whether cases meeting all the other definitional requirements but lacking any or all of these two ones would still meet the minimum threshold for being
labelling as slavery by Bales. Moreover, the concept of psychological benefit would have also required further explanation.

However, there are also other sociological definitions of slavery that focus on other characteristics. For instance, in his book entitled Slavery as Social Death: A Comparative Study, Orlando Patterson defines slavery as “the permanent, violent domination of natally alienated and generally dishonoured persons” (1982). This definition would apply well to many societies of the past in which slaves were born into a condition of slavery and who would have a lesser status within the society. Moreover, Bales and Patterson agree that violence might play a central role in the relationship between masters and slaves. The concept of dishonor used by Patterson remained, however, hardly explained.

Patterson subsequently amended its definition stating that slavery is the “violent, corporeal possession of socially isolated and parasitically degraded persons” (2012). In referring to possession, Patterson relies on a concept that is very similar to the one of ownership (and associated rights) included in the 1926 legal definition but, as Bales, avoids the legal implications of property rights. The reference to isolation and degradation included into this latter definition are then further clarifying the condition in which the slaves are, according to Patterson, held.

Finally, Anthony Honoré defines a slave as a “person who, in fact, though not in law, is subordinate to an unlimited extent to another person or groups of persons [. . .] and who lacks access to state or other institutions that can remedy his or her inferior status” (2012). This definition is centered on the factual inferiority of the victim, even if in making reference to an unlimited subordination, it would raise the same concerns already manifested before for the reference to total control by Bales. Moreover, it also includes a reference to the lack of access to remedy. The latter element would, however, be hardly reconcilable with the existence of law enforcement and judicial institutions to which victims can generally refer their situations.

The concepts of contemporary forms of slavery, contemporary slavery, modern slavery, and, finally, modern-day slavery are positioned in a grey area between the legal and sociological definitions and they are nowadays frequently used by many relevant global governance actors. These include, inter alia, international organizations (IOs), states, sui generis entities such as the Holy See, non-governmental organizations (NGOs), informal groups and networks, as well as scholars and media agencies. However, the concept of contemporary forms of slavery – as well as similar ones – remains undefined in international law; as stated elsewhere, “the issue is relevant not only in semantic terms, but also from a legal and a political perspective” (Scarpa 2018: 9). However, reference to (forms of) contemporary, modern, or modern-day slavery as umbrella concepts, allow to avoid careful scrutiny of the uncertain legal boundaries under international law of the exploitative practices mentioned in this study, as well as to transcend considerations about the eventual inclusion of these exploitative practices into the concept of slavery, as defined in the 1926 Slavery Convention (Scarpa 2018). Some scholars; international organizations, including in particular the United Nations; States – such as inter alia the United States and the United Kingdom – and other global governance actors use them exactly in this way (Scarpa 2018). A better understanding of the contours of the
concept of contemporary forms of slavery and of similar ones and the promotion of a coherent shared legal and policy framework is, therefore, of paramount importance.

**Conclusion**

The various interpretations of the legal definition of slavery included in the 1926 Slavery Convention, the blurred boundaries between the legal concept of slavery and the ones of the practices similar to slavery, servitude and forced or compulsory labour, the sociological frameworks developed by some leading scholars and the re-orientation of the debate by global governance actors in terms of contemporary (forms of) slavery show the complexity of the issues discussed in this study. It is fully believed that the way forward in this field includes as a preliminary first step a re-consideration of the interpretation of the international legal definition of slavery through a much-needed analysis of the two elements that constitute customary rules of international law, namely the existence of a consistent and coherent practice (*diuturnitas*) shared by most States in the world and the corresponding *opinio iuris sive necessitatis*. Unfortunately, the only commendable study in this area that consistently followed such a path dates back to the 1990s. Its author, A. Yasmine Rassam (1998–1999) recognized that the evidence of *opinio iuris* and States’ practice that emerged from an analysis of their behavior led to contradicting conclusions as to the boundaries of slavery’s definition in customary international law. Accordingly, she resolved this ambiguity by employing principles of non-discrimination on the basis of gender and increased participation by traditionally disadvantaged groups to the benefit of international legal discourse. For this reason, according to Rassam, the customary rule of international law prohibiting slavery should be evolved so as to include sex trafficking, forced prostitution, debt bondage, forced labour and the exploitation of immigrant domestic workers. Rassam recognised, though, that such an inclusion should not be considered as a “panacea for these looming global problems”; these should instead primarily be fought by enacting (and we believe, properly implementing) relevant domestic legislation, providing another chance to generate respect for the human rights of individuals belonging to these vulnerable categories (Scarpa 2018). In a more recent study, Anne T. Gallagher (2010: 190-191) concludes that the customary prohibition of slavery has undergone changes, which might according to the author “potentially include contemporary forms of exploitation such as debt bondage and trafficking.” However, as stated elsewhere, “Gallagher not clarify whether or not she took into consideration the relevant elements of customary rules of international law (namely *diuturnitas* and *opinio iuris sive necessitatis* of States) in reaching this conclusion” (Scarpa 2018: 19–20). Therefore, it is believed that “a new study on the interpretation of the *jus cogens* rule of international law prohibiting slavery is needed, at least for two reasons: firstly, there have been major legal developments since the 1990s (in particular, adoption of the UN Trafficking Protocol, the ICC Statute and the ILO Convention on the Worst Forms of Child Labour) and secondly, the conclusions from Rassam’s study were not only descriptive of the legal standards eventually
existing at that time, but also prescriptive in detailing what the law ought to be” (Scarpa 2018: 20). Moreover, since research on the blurred boundaries among the international legal concepts of slavery, the practices similar to slavery – namely debt bondage, serfdom, and the institutions and practices affecting women and children – servitude, forced labour, child labour, the worst forms of child labour and trafficking in persons is limited, the new study should also bring light into these areas. Finally, a conceptual clarification on the use of the concept of contemporary (forms of) slavery – or similar ones – by global governance actors is necessary as a way to guarantee a much needed concerted global action.

Explanations and Methods of Inquiry
Interest in measuring the extent of human trafficking victimization has grown as the public has become more concerned about the problem. In the wake of legislation criminalizing human trafficking acts, mandating government responses, and allocating funding to anti-trafficking efforts, evidence about the nature and scale of the problem is needed to guide such efforts. Despite attempts to develop robust methodologies to study human trafficking, few reliable measures exist. This chapter examines the strengths and limitations of methodologies that have been employed to measure the scope and nature of human trafficking victimization globally and locally.

**Keywords**
Human trafficking · Measurement · Methodology · Multiple system estimation · Capture-recapture · Estimation
Despite dramatic increases in public attention and responses from governmental and nongovernmental organizations to the problem of human trafficking in the past two decades, it has proven difficult to reliably measure the nature or scale of trafficking in persons locally, nationally, or globally (Merry 2016; Zhang 2012). Estimates of the prevalence of human trafficking suffer from numerous definitional, operational, and methodological limitations that undermine their utility and result in wide-ranging estimates of the problem (Tyldum and Brunoiskis 2005). Estimation efforts have variously utilized non-systematic and incomplete data taken from open-source information (e.g., news reports), police and court records, and victim service case files. Most estimates focus on measuring the number of victims as opposed to measuring the phenomenon of trafficking in persons including perpetrators, networks, or cases. At best, these data represent responses to human trafficking as opposed to the phenomenon itself. Despite the limitations of existing measures, reliable and valid estimates of the prevalence of human trafficking are critical to helping us understand the magnitude of the problem, who is at risk for trafficking, and the types of social conditions that breed trafficking crimes (David 2017). Additionally, we must be able to measure the number of human trafficking victims and prevalence of human trafficking operations in order to design adequate service programs and assess the efficacy of efforts to interdict or prevent the problem.

In this chapter we discuss the challenges of measuring trafficking in persons and explore four broad approaches to estimating the prevalence of human trafficking. These include (1) capture-recapture methodologies using open-source information, (2) multiple system estimation procedures utilizing administrative records, (3) field-based research utilizing chain referral sampling methodologies to identify victims in local communities, and (4) the use of online domain data and network approaches. For each methodology, we describe the basic principles of the approach and provide examples of its use. We conclude with some summary comments on the future of measuring trafficking in persons. Understanding the challenges of measuring human trafficking and the strengths and limitations of various approaches will inform service providers, policymakers, and other stakeholders as they develop the most appropriate responses to human trafficking problems and monitor the effectiveness of these efforts.

Challenges to Measuring Trafficking in Persons

There are a number of reasons why it has proven difficult to measure the extent and nature of trafficking in persons. First, the definition of the acts that constitute trafficking in persons is not universally agreed upon. The basic parameters of trafficking laid out by the United Nations and adopted by over 150 countries (United Nations Office on Drugs and Crime 2016) are generally premised on a definition of trafficking that includes commercial sex or labor propagated through force, fraud, or coercion. However, individual countries and states within countries have adopted different definitions of the scope of activities that constitute trafficking in persons crimes. For example, some US states define nearly all commercial sex that involves
third-party facilitation as human trafficking (e.g., Massachusetts, Minnesota), while most others necessitate clear evidence of force, fraud, or coercion despite third-party facilitation (National Conference of State Legislatures nd). The range of activities that are counted as human trafficking also varies across context. Some counties include organ trafficking, child pornography, debt bondage, or forced marriage in their definitions of trafficking in persons, but others do not (Bales 2017). It is also difficult to distinguish trafficking in persons from conditions that do not result from trafficking operations (e.g., exploitative labor circumstances where there was not a clear recruitment/transportation by means of force, fraud, and coercion), yet there was an “act of treating someone with substantial unfairness in order to benefit from their work” (see Campana and Varese 2016: 93; see also Munro 2008). Different interpretations of what constitutes trafficking, exploitation, or both make consistent measurement difficult (Bales 2017). The lack of clarity in law and policy about the definition of trafficking in persons undermines efforts to measure the phenomenon because measurement necessitates precision in identifying the objects that are to be counted. Therefore, efforts to estimate the scope of trafficking in persons do not align when researchers begin with different definitions of the problem. A working definition of trafficking in persons among scholars and government officials is critical, because without it, attempts to measure the problem may be critiqued and dismissed.

Second, trafficking in persons is also difficult to measure because victims of this crime are often hidden and do not come to the attention of officials who might be expected to record and classify their experiences. Although the problem of measuring undetected victims of crime is not new to criminologists, human trafficking presents particular challenges because perpetrators purposefully hide victims from official detection among groups of workers who may not be exploited. Additionally, identification is challenging because victims commonly do not seek help for a variety of reasons. They may not self-identify as victims, fear the police, and/or are suffering from the effects of prolonged trauma that make outreaching to service providers or law enforcement more difficult (Hopper 2004). As a result, the entities that we traditionally depend upon to count crimes and crime victims (e.g., police, social service agencies, victim service providers) may not encounter a large number of persons who would be classified as victims of human trafficking.

Even when officials do come into contact with human trafficking victims, they may not be recognized. Reasons for under-identification are numerous. For example, research on police identification of human trafficking confirms that law enforcement officials have limited knowledge about human trafficking crimes (Farrell et al. 2010; Newton et al. 2008; Wilson et al. 2006). Therefore, law enforcement faces significant challenges identifying human trafficking and distinguishing it from other crimes (Farrell et al. 2014, 2016; Owens et al. 2014) and lacks procedures necessary to ensure effective investigations (Farrell and Pfeffer 2014; Gallagher and Holmes 2008; Verhoeven and Van Gestel 2011; Van der Watt and van der Westhuizens 2017). Similarly, victim service providers lack validated screening tools, training, and guidance necessary to help guide their identification of human trafficking victims among clients they serve (Macy and Graham 2012).
When law enforcement, victim service, or other government or nongovernmental organizations do not come into contact with and fail to successfully identify victims of human trafficking, there is good reason to believe that human trafficking cases are misrepresented in official data sources. For example, in the USA, human trafficking offenses were only added to the national crime reporting program in 2013 (FBI 2014), and state compliance with reporting of these crimes has been uneven and slow (Farrell and Reichert 2017). Many social service providers do not have the capacity to keep records on victims they serve, or the record-keeping systems that do exist do not include fields that accurately capture human trafficking victimization. Even when information that identifies human trafficking victims is included in official record-keeping systems, there are often challenges accessing that information due to concerns about confidentiality and a lack of agreement about standards for data sharing (Clawson et al. 2006).

Finally, victims of human trafficking commonly do not self-identify as such. The public lacks information about the nature of sex and labor trafficking victimization, and as a result, people who experience these crimes often do not recognize themselves as trafficked persons (Owens et al. 2014). Methodologies of measurement that seek to identify underreported victimization such as self-reported victimization surveys (e.g., US National Crime Victimization Survey) depend on victims to self-identify and may be undermined by the inability of people to recognize their experiences as constituting human trafficking victimization.

**Estimation Strategies Using Open-Source Information and Capture-Recapture Principles**

Capture-recapture approaches have been widely used to estimate the prevalence of trafficking in persons globally and within countries (e.g., see Belser et al. 2005). Primarily used in wildlife research where it is impossible to observe all members of a population (e.g., fish in a pond), capture-recapture methods seek to derive populations by taking independent samples of a population and identifying how likely it is that a member of the population will be reidentified upon additional sampling. The capture-recapture approach has been used by social scientists interested in studying hidden people or groups of people by using independent records or recording systems, for example, in relation to domestic violence, immigrant populations, or forecasting disease studies (see, e.g., Bishop et al. 2007; Chao et al. 2001; Van der Heijden et al. 2012). By linking individuals who are identified in each of the lists (or by two independent recorders), researchers can estimate the number of individuals that are never identified or do not appear in either register or list. Capture-recapture approaches to estimation are based on a number of important assumptions. First, the population being studied cannot change during measurement. In the example of fish in a pond, no fish can leave the pond or die, and no new fish can be born. Subjects must have an equal chance of being captured each time (or appearing on each list), and researchers must be able to accurately match subjects caught in each catching attempt. Finally, the likelihood of being caught each time
must be independent of the likelihood of being caught at other times (being on one list does not affect your chance of being on another list). While some of these assumptions are flexible or could be addressed with variations on the method, many of the assumptions are particularly hard to meet in the context of human trafficking. For example, a closed population is unlikely considering the rotation of victims in many trafficking operations, and an equal chance of being captured each time is questionable when agencies have distinct priority setting and focus on a different group of victims (see, for a discussion of these challenges, Van der Heijden et al. 2015).

Capture-recapture approaches have been used by researchers to estimate the likelihood of subjects appearing in open-source information as recorded by two independent observers. For example, early estimates of human trafficking in the USA were developed by teams of researchers who coded open-source information to provide a number of different estimates on the scope of human trafficking. One of the first estimates produced by Richard (1999) was developed by independent teams of recorders coding information cases of human trafficking (or individual human trafficking victims) in intelligence reports, law enforcement data, and news clippings about trafficking cases in the USA and internationally. The Richard report suggested over 50,000 people were trafficked in the USA and 800,000–900,000 people were estimated to be trafficked across borders globally each year (for a detailed description of the methodology, see Kutnick et al. 2007). Numerous methodological problems and a lack of transparency about the way estimates were derived raised questions about the reliability of these early open-source estimates. The US and global prevalence estimates were revised numerous times, subject to significant critique, and eventually the US government stopped using estimates of human trafficking prevalence in its official publications (see GAO 2006).

Other organizations and scholars developed global estimates of prevalence by using capture-recapture approaches with open-source information. For example, the ILO has produced a number of global estimates of forced labor (including sex and labor trafficking) (ILO 2012, 2016). In 2016 the ILO estimated that roughly 40 million people globally were victims of human trafficking including 25 million victims of forced labor (including sex and labor trafficking) and 15 million victims of forced marriage. The 2016 ILO methodology included multiple methodologies including survey data from respondents in 48 countries and data from IOM on assisted human trafficking victim (ILO 2016). The use of multiple methods reflects limitations identified in earlier ILO prevalence estimation procedures, most notably a capture-recapture methodology for identifying victims of human trafficking that appears in open-source information. In the 2012 ILO report, 5491 reported cases of forced labor were found in the capture-recapture exercise; 4069 were found only once; and 1422 were found multiple times, resulting in a global estimate of nearly 21 million victims. In the most recent 2016 report, the ILO suggests that the earlier 2012 estimate based on capture-recapture methods underestimated the number of

1The principle of capture-recapture is not, however, to have two independent observers but to have two independent chances to be included in the population samples.
forced labor victims because cases of forced labor often did not appear in open-source information (ILO 2016).

Estimates that project victimization based on limited publicly available information have been criticized for relying newspaper accounts or reports from agencies that have identified victims of trafficking (see Gallagher 2017). Data quality issues and definitional challenges, discussed earlier in the chapter, are exacerbated when researchers attempt to use open-source data about identified victims, since the recognition of victims depends on the definitions applied by practitioners in the field and identified victims may have very different characteristics and experiences than victims who are not identified in open-source information. In addition, identifying information about individuals is required to make correct linkages across the different captures, yet this may be difficult to obtain for hidden or hard-to-reach populations (see Van der Heijden et al. 2015).

### Multiple System Estimation

Multiple system estimation (MSE) is a methodology building on capture-recapture approaches that has received recent attention by scholars and government officials seeking better estimates of human trafficking (Cruyff et al. 2017). MSE applies core principles of capture-recapture methods to administrative data from multiple sources to predict population sizes. The basic assumption of MSE is that concurrent lists of persons in a hidden population taken from multiple sources in a community can be compared to identify how often particular persons are identified across more than one list. MSE methods are used to estimate an unknown population based on the probability of an individual being included on any one set of lists or a combination of lists, including not being captured on any of the available lists. Unlike capture-recapture approaches utilizing open-source information, MSE methods rely on traditionally closed administrative records, believed to be more reliably representing agency “catches” of individuals being studied. MSE has been utilized by researchers attempting to measure the prevalence of other human rights violations (Lum, Price, Guberek, and Ball 2010) and deaths in conflict (Ball et al. 2003; Manrique-Vallier et al. 2013). Recently MSE methods have been utilized by researchers in the UK (Bales et al. 2015) and the Netherlands (Cruyff et al. 2017) to estimate human trafficking victimization in each a county.

A preliminary step in MSE is stratifying lists and pooling individuals across stratified lists. MSE relies on the analysis of inclusion patterns to estimate the probability of an individual not being on any of the lists. Poisson log-linear models are fitted to the data to identify the number of cases occurring on any particular combination of lists. The resulting analyses provide an overall estimate of the size of the total population of human trafficking victims along with a measure of the error and confidence intervals for that population.

While MSE is a promising methodology, there are limitations to this approach. First, like capture-recapture, MSE assumes that victims or perpetrators would have equal probability of being captured on any of the potential lists, though the use of
multiple lists makes the assumption of non-independence more flexible. Additionally, the capture must be independent, that is, being captured on one list does not change the probability of being captured on another list. Since these assumptions may be violated in the case of human trafficking victims and perpetrators, additional care must be taken to account for list dependence and unequal catchability. Researchers in the Netherlands determined that it was critical to include covariates such as age and type of exploitation in the MSE models as this information allowed researchers to control for differences in the likelihood of being captured on different lists and produced different estimates than models without covariate information (Cruyff et al. 2017). In addition to potential measurement problems, reliable data to support MSE may not exist in many communities. Primarily, officials who keep administrative records (e.g., law enforcement, social service agencies) may not accurately report information on those human trafficking victims they do identify through traditional case management or records management systems. Finally, even when agencies identify and accurately report information about human trafficking victims, they may be unwilling to share list information with researchers due to confidentiality concerns. MSE analysis in the UK and the Netherlands was based on data collected through National Referral Mechanism sources. MSE methodologies may also be utilized in contexts where information about victims that is to be compared is housed in separate, disconnected record-keeping systems such as victim service records, police reports, or social service agency case files. In these situations, researchers must develop mechanisms to ensure confidentiality of victim information for the purposes of list comparison.

Local Surveys or Field Observations

Due to the limitations of open-source and official data in estimating hidden or hard to reach populations, some scholars have employed field observations or country and/or region surveys to identify the prevalence of victimization among populations’ sources. Local surveys have the benefit of capturing information directly from people who may be affected by human trafficking, but they are time and resource intensive and often are limited to smaller geographic areas.

One of the simplest forms of local surveys is the integration of questions about human trafficking victimization (or vulnerability to victimization) into large-scale national public surveys. The Walk Free Foundation partnered with the Gallup World Poll to ask members of the public about the degree to which they have been personally affected by human trafficking (e.g., they were trafficked, or members of their immediate family were or are trafficked). To date, Walk Free and Gallup have surveyed respondents in 25 countries about human trafficking victimization (Global Slavery Index 2016). The Gallup survey data has been used by Walk Free researchers to inform county-level prevalence estimates. In their most recent version of the index, Walk Free estimates that there are 45.8 million people in some form of modern slavery worldwide (Global Slavery Index 2016). Data for the Walk Free estimate come from the general population surveys in 25 countries. Because survey
data are not available for most countries, researchers at the Walk Free Foundation extrapolated the prevalence of human trafficking for countries without surveys. Extrapolation was based on matching countries without surveys similarity to countries with survey data across 24 measures representing social health and economic rights, personal security, and refugee populations and conflict (Global Slavery Index 2016).

Although the Global Slavery Index attempts to creatively utilize local survey data to inform global estimates, standard national survey sample sizes of a 1–2000 respondents in a single county are generally too small to meaningfully detect rare events such as human trafficking. This problem is exacerbated in countries where human trafficking is rare. The result is that prevalence estimates utilizing survey data include large margins of error and do not allow researchers to draw reliable conclusions about the prevalence of victimization in a county or to compare prevalence across counties (Gallagher 2017). Additionally, survey household methodologies are often limited to populations of victims who have been “freed” and are less likely to access individuals who are currently in a situation where they are victimized.

Other researchers have utilized targeted surveys in a particular locality to collect information from people selected for inclusion in the survey based on their personal risk factors or on a recommendation by someone in their social network who is a known victim. Local surveys allow researchers to reach victims in their “natural environment” and gain access to hard-to-reach, hidden populations. For example, in 2011, Steinfatt and Baker hired moto-cycle drivers to help researchers identify thousands of commercial sex venues in Cambodia. By working with deeply embedded informants, researchers were able to gain access to individuals selling sex who operated in a variety of known and lesser known commercial sex venues. Steinfatt and Baker then interviewed commercial sex operators and those selling sex about the nature of their experiences, including vulnerability to human trafficking to estimate the prevalence of sex trafficking in Cambodia. They estimated the number of actual sex trafficking victims to be close to 3000 – a degree of prevalence substantially lower than those reported by nongovernment and government organizations in Cambodia (Steinfatt and Baker 2011).

Chain referral sampling methods or respondent-driven sampling has been used to identify human trafficking victims in a number of defined geographic areas. This method is a variation of snowball sampling, designed to overcome the limitations of volunteerism, biased referral methods, and homophily among the referred sample. Originally developed by Heckathorn (1997, 2002) to study injection drug users, respondent-driven sampling (RDS) utilizes a series of statistical parameters to inform the chain referral sampling methods. RDS methods rely on identifying “seeds” within a hidden population. Seeds represent people who have particular experiences and networks that facilitates connecting researchers to individuals who have experienced the phenomenon under study. Respondents receive an incentive to participate in an interview and receive further compensation for each referral that successfully completes an interview. Referrals from each seed are limited, and weights are applied to each respondent on the basis of the size and reach of his or her social network. The statistical parameters that guide the chain referral sampling
within RDS allow researchers to derive estimates back to the population. Researchers have used respondent-driven sampling methods to study other hidden populations, such as women and children in street prostitution (Tyldum and Brunovskis 2005; Curtis et al. 2008), drug users (Heckathorn 1997), and the homeless (Williams and Cheal 2002). Utilizing chain referral methods, Zhang et al. (2014) surveyed over 800 undocumented migrant workers in San Diego, California, and estimated that roughly 30% of the undocumented migrant workers in San Diego were victims of labor trafficking. Zhang’s research also shed light on the nature of labor trafficking in San Diego, where the highest rates of labor trafficking occurred in construction and janitorial services and that undocumented immigration status was the most important variable in a person’s risk for trafficking.

However, like all research methods, respondent-driven sampling and other chain referral approaches have limitations. Even when researchers are able to locate traditionally hidden populations, participants may not be in a position to disclose victimization. Victims of human trafficking may be under the control of another person, and admitting to exploitation and victimization could lead to retaliation from their trafficker (Brunovskis and Surtees 2015). Fear, shame, or financial necessity may also prevent participants from revealing victimization and may skew data toward a more conservative estimate. Furthermore, even with the support of “insider informants” or “seeds” who are trusted within their social network, it is likely that hidden populations exist that are unknown to researchers and the subject community. For example, given the social stigma around child abuse and exploitation, some informants may be reluctant to refer researchers to subjects working in brothels where very young girls are being exploited. Similarly, subjects may avoid referring others in their social network when they fear this gets them into trouble. In this way informants may selectively choose which sites they bring outsiders to or who gets referred. Due to the resources needed to saturate communities being studied, RDS samples are limited and may not be generalizable. For instance, farmworkers in San Diego may be able to provide researchers with valuable information about trafficking in the local agriculture industry, but their experiences may differ from exploited agricultural workers in other parts of the country or victims of other forms of labor exploitation, domestic service, hospitality, or restaurants or construction industries. Finally, RDS methodologies limit estimates to relatively small geographic units and must be replicated across multiple locations to develop national or global estimates of human trafficking prevalence (Zhang 2012).

**Using Online Domain Data and Network Information to Measure Human Trafficking**

The Internet has become an essential part of most people’s daily routines, yet online domains can also serve as platforms for emerging cybercrimes and can facilitate crimes that occur in physical space like human trafficking. It may seem tempting to believe that Internet-facilitated crimes are even more difficult to detect than crimes occurring in physical space. The multijurisdictional context of the Internet
complicates the prosecution of perpetrators (Levi and Wall 2004; Newman and Clarke 2003; Wall 2007; Yar 2005), and these online interactions give criminals an informational advantage in addition to access to a potential new field of distanced victims, clients, and other offenders (Wall 2007). The Internet simultaneously offers a wide array of possibilities to detect crimes, especially when the crime in question depends on a broad public engagement and is therefore more likely to be facilitated with publicly accessible online domains rather than the dark web, as seems to be the case with sex trafficking. Considering the difficulties of accessing reliable information about human trafficking victimization through publicly available sources, government records and key stakeholders, research that engages buyers, facilitators, and other community members who are connected to human trafficking and have information about the problem is of great potential value (Zhang 2009). The use of online domain data and network information are two innovative mechanisms to access such information.

The Internet facilitates human trafficking through the online recruitment of victims and promotion of labor or sexual services (Latonero et al. 2011; Mendel and Sharapov 2016). Additionally, open-access online domains make illicit behaviors accessible to a broad range of individuals that may facilitate crime while not explicitly taking part in the coordination of illicit acts. For example, recent work has elucidated how sexually oriented forums and review boards engage clients across a wide geographic span in commercial sex and sex trafficking (Blevins and Holt 2009; Holt et al. 2008; Holt 2010). Research has also alluded to a potential problem of labor exploitation in emerging online markets like driving apps, online shopping, or on-demand online labor services where there is a limited monitoring and where consumers seek for the best products against lowest prices (Sundararajan 2016).

With the Internet being of central importance to human trafficking activities (Latonero et al. 2011; Mendel and Sharapov 2016), an affordable and valuable source of data to detect and systematically measure the problem presents itself. Scholars have begun to call for the use of machine learning techniques, data mining, information retrieval, information integration, and natural language technologies to automatically compile and correlate information from open Internet sources with the aim to discern human trafficking patterns (Konrad et al. 2017). A recent study by Dubrawski et al. (2015) compares the merits of various analytical techniques to identify sex trafficking in online domain data. The study points to the relevance of automated text extraction that searches for keywords indicative of sex trafficking as provided by law enforcement or other experts, combined with classification algorithms that extract other structural text features from the advertisements and can isolate the most likely trafficking ads. Other studies, too, have applied automated text analyses to identify commercial sex and sex trafficking across a large number of online classifieds (e.g., Ibanez and Suthers 2014; Portnoff et al. 2017).

Online domain data have also proven to be helpful to estimate demand for sexual services. For example, Bouche and Crotty (2017) utilized data from an online review board about erotic massage businesses combined with a physical camera monitoring of massage establishments to estimate a total demand for commercial sex in these venues in Houston, Texas.
Furthermore, studies utilizing online domain data have also begun to measure the online networks underlying human trafficking. Examining online networks is important because “technology is reconfiguring many of the networks that underpin many aspects of human trafficking” (Thakor and Boyd 2013: 280). Through applying network analytical techniques to online domain data, a few studies expose how trafficking operations are connected to each other through shared ownership of brothels, multiple sex providers, or shared clientele networks when clients are “shopping around” at different places and are recommended places through online classifieds and review boards (Ibanez 2015).

Examining the networks underlying human trafficking promotes a more comprehensive understanding of the nature and scale of the problem for three reasons. First, through network analysis, the structure of the relationships and interactions between all trafficking actors can be measured, and the flow of goods, money, or information through these connections can be exposed (Konrad et al. 2017). Examining the structures of networks can also point to the most critical trafficking actors that need to be addressed with appropriate criminal justice or anti-trafficking responses (see, e.g., Campana 2015).

Second, network techniques can be utilized to expose individuals that have not formally been identified as victims or offenders but may be at increased risk to be involved in trafficking operations due to a similarity with or social proximity to existing victims or offenders. Utilizing so-called link-prediction techniques, the probability that a tie between individuals exists as a function of network characteristics (e.g., social proximity) and individual-level attributes can be predicted. As shown in prior research on different crime types, these techniques help obtain a more complete picture of criminal networks based on partial knowledge of offenders and known co-offending networks (Berlusconi et al. 2016; Liben-Nowell and Kleinberg 2007). Recent work by Konrad et al. (2017) points to link-prediction techniques as holding great promise to measure the nature and scale of human trafficking that has proven to be difficult to address with traditional estimation methods.

Third, networks comprised of both criminal and noncriminal participants can give insight into the nesting of human trafficking in larger social and economic contexts. As was mentioned in another chapter of this edition, individuals and businesses in a legitimate context may be connected to human trafficking activity through regular social and economic ties and, as such, can maintain a market or social structure that allows for human trafficking to persist (De Vries, Jose, and Farrell, this edition). Researchers have quantified networks comprised of criminals and noncriminals to create an understanding of the nesting of crime in a broader legitimate surrounding for other crimes such as organized crime or gang violence (Smith and Papachristos 2016; Malm et al. 2010).

The Way Forward in Measuring Human Trafficking?

There have been significant advances in the methodologies employed to understand the scope and nature of human trafficking. Researchers have offered sound and meaningful critique of many of the early efforts to simplistically utilize publicly
available information about victims and cases to develop national or global estimates. Efforts to characterize human trafficking victimization based on thin and unreliable sources of information have similarly been met with pushback from scholars (see Weitzer 2014 for review of critiques). Researchers are developing innovative techniques to analyze existing data, and efforts are underway to developed new sources of data. There are a number of important steps that can improve our ability to measure the nature and scope of human trafficking in the future.

First, government officials and agencies serving human trafficking victims in a variety of capacities must commit to improving administrative data. This includes integration of human trafficking into existing records management systems and the development of standardized definitions of human trafficking to guide identification and reporting. The potential promise of multiple system estimation techniques to provide regularized local or regional human trafficking estimates depends on high-quality administrative data.

Second, funding is needed to support labor- and time-intensive studies utilizing local surveys and chain referral sampling within targeted populations. These efforts will likely provide the richest information about the nature and characteristics of human trafficking victimization across specific venues and contexts. Most importantly, it requires a shift in our focus from solely relying on official data and traditional methods to including new data and methods, such as information from digital domains. These local studies not only provide baseline information about how and under what conditions people experience sex and labor trafficking, but they could be triangulated with information from administrative records or digital domains to learn about areas of under-identification.

Third, new sources of data should be continually explored as the nature of trafficking in persons crimes evolves. The shift toward new data and methods can address some of the difficulties associated with existing official data and helps to discern human trafficking trends at scale. Nonetheless, these types of data and associated techniques do not come without challenges. For example, not all trafficking may be represented online, data can be sparse or inaccurate, and missing information on individuals and organizations in networks poses challenges to understand the structure of trafficking operations (see, for more challenges, Campana 2015; Dubrawski et al. 2015; Konrad et al. 2017). Therefore, future research should explore how online domain and network data can be corroborated with information obtained from other sources.

Finally, collaboration is key to advancing our understanding about human trafficking. Collaborative efforts among researchers to share methodological techniques without ego is needed and will ensure we learn from each other’s missteps. Willingness to share information is also needed from practitioners in the field. Collaboration has been central to efforts to combat human trafficking through task forces and joint investigations. Researchers need mechanisms to access traditionally confidential information in order to test models, identify potential RDS seeds, and measure the degree of under-identification that may exist in official records. Such collaboration requires long-term commitment from researchers to partner with public and private entities that interface with human trafficking victims, the
negotiation of data sharing and confidentiality protocols, and the willingness of researchers to, where possible and appropriate, provide information that will inform and advance the mission of anti-trafficking practice.

The UNODC *Global Report* on Trafficking in Persons: An Aspirational Tool with Great Potential

Vanessa Bouché and Madeleine Bailey

**Abstract**

The Global Report on Trafficking in Persons, published by the United Nations Office on Drugs and Crime (UNODC), is an assessment of the patterns and flows of trafficking in persons, based on country-level data from about 130 countries across the world. This chapter will examine the Global Report’s methodology and discuss the advantages and disadvantages of analyzing trafficking crime by using likely cases of human trafficking and victims as the units of analysis. It will also look at the results presented in the past editions of the report, as well as how the quality and quantity of the data available has changed over time. The question of the global magnitude of the trafficking crime and possible ways of estimating the number of trafficking victims will also be examined.

Introduction

The United Nations Office on Drugs and Crime (UNODC) publishes periodic reports to assess the human trafficking problem globally. Four official (and one unofficial) reports have been published, each based on survey data collected by UNODC from about 130 countries. This data is compiled into an exhaustive report that contains both cross-country and regional analyses of human trafficking. Given its data-driven approach, the Global Report has potential to provide accurate insight into the scope of the human trafficking problem. The Global Report has already uncovered some important information about human trafficking criminalization worldwide and has attempted to identify other patterns in human trafficking with limited success (Gallager 2011). In this chapter, we analyze the report’s methodology and provide recommendations to enhance data quality and impact.

Background on UNODC Global Report on Human Trafficking

In 2006, the UNODC conducted its first study on the global response to the crime of human trafficking. The study was based on content analysis of open-source information collected from 113 sources reporting trafficking cases from 1996 to 2003. Data sources included international organizations (32%), governmental institutions (27%), research institutes (18%), national governmental organizations (18%), and media (5%). The study’s “Foreword” acknowledges the limitations of the data set, recognizes that the report does not provide a “reliable global overview,” and aspires to “present more and better information in the future.” The 2006 report was a precursor to future reports, which take a very different methodological approach.

The 2009 Global Report was based on data collected from a survey distributed to 155 countries and territories, as well as open-source information. The survey used for the 2009 Global Report consisted of 50 questions, few of which yielded data appropriate for cross-country analysis because of the significant item nonresponse rate given the lack of detailed data kept by most countries on human trafficking patterns. Ten researchers assigned to different UNODC field offices collected the data for the countries in their geographic region. Data collection was divided into three main categories: (1) state anti-trafficking legislation; (2) criminal justice data on investigations, arrests, prosecutions, and convictions; and (3) victim services information. The Introduction and methodological note recognize that the report provides merely a “preliminary snapshot” with “potential to become much more.” The 2009 Global Report begins with an overview that provides analysis of global trafficking flows, national legislation, and criminal justice responses. This is followed by a section on country profiles with more detailed information on each country.
The 2012 *Global Report* was the first to be published in response to the 2010 United Nations Global Plan of Action to Combat Trafficking in Persons (A/RES/64/293 2010). This action plan stressed the importance of obtaining more research, data, and analysis about global human trafficking. Both the 2012 and 2014 reports were very similar to the 2009 report, beginning with a global overview and then delving into country profiles. The major difference is that the research team significantly revised the questionnaire, decreasing the number of questions and the level of specificity. In 2016, the fourth *Global Report* was published, and it offers a similar analysis of global trends in trafficking based on survey data and open-source information. The survey retained the same basic format as that used for data collection in the 2014 report, but added a question to disaggregate the type of human trafficking by sex of the victim.

The next report will be released in 2018 and will be organized similar to previous reports. However, the research team continues to improve the questionnaire with each iteration. The survey for this report added an additional question regarding age of the victim and will provide analysis examining victim age by the type of human trafficking. It also removed a question in the 2016 survey that asked about the value of assets seized by human traffickers since it did not yield reliable results.

The UNODC *Global Report on Trafficking in Persons* is a platform that has generated some important insights into global trafficking patterns (Gallager 2011). The following analysis discusses methodological strengths and weaknesses of the most recent report and potential changes to the report that would yield a more integrated and effective data set for analysis.

### 2016 UNODC *Global Report* Methodology

#### Strengths

The 2016 *Global Report* successfully obtained survey data from 136 countries, which is no small feat. Perhaps the strongest aspect of the report, however, is the analysis of state legislative responses to human trafficking. Since legislative tracking is available in the public domain, this data is valid and reliable (UNODC Global Report 2016a). Also, in addition to legislative tracking in the public domain, the questionnaire asks what section of the country’s criminal code addresses human trafficking. Cross-referencing the survey results regarding legislative responses with the legislative tracking yields highly reliable results with significant policy implications.

One implication is that the report provides a UN-administered metric to gauge compliance with international law on human trafficking, a metric notably missing from the current international regime (King 2008). One of the binding provisions for signatories of the Palermo Protocol is the requirement to criminalize human trafficking, and the 2016 *Global Report* reveals that compliance is on the rise. The number of countries criminalizing trafficking as defined by the Palermo Protocol increased from 33 in 2003 (18%) to 158 in 2016 (88%). A second implication is that
the report allows for a definitional analysis of human trafficking, examining the extent to which country definitions of the crime comport with the definition of human trafficking set forth in the Palermo Protocol. The 2016 Global Report finds that about 90% of countries have adopted the Palermo Protocol definition of human trafficking.

Another strength of the 2016 Global Report is that it provides useful insight into movement patterns – generally identifying source, destination, and transit countries. This is a good starting point for UN member states to shape policy initiatives that address trafficking effectively in light of their countries’ placement in the human supply chain. This information is also generally available in the public domain, so it is not subject to considerable self-reporting bias.

Although the Global Report has elevated the quality and scope of information available on global human trafficking, there are a few areas the report can improve (Gallager 2011). These are discussed in detail in the following section.

**Weaknesses**

The 2016 Global Report is transparent about the limitations of the data collection (UNODC Global Report 2016a). In a brief methodological note near the beginning of the report, the authors explain that data on detected cases cannot adequately estimate the scope of human trafficking because of the problems inherent in observing and accurately recording illicit activity. Below, we provide a more detailed analysis of the limitations of this type of data.

**Detected Cases as a Unit of Analysis**

The UNODC Global Report’s analysis is based on detected cases of human trafficking. This is problematic for a few reasons (UNODC Global Report 2016a). First, different countries have different capacities to assess human trafficking within their borders (King 2008). For example, countries with mostly rural populations or underfunded or underdeveloped law enforcement infrastructure are likely to detect and report less cases of human trafficking on average than states with sophisticated criminal justice systems. Additionally, reporting incentives change from country to country, and in some states incentive structures may create an environment that impedes accurate reporting on human trafficking. Finally, definitions of human trafficking in the criminal code may differ from country to country, and even those countries with similar definitions or those with definitions consistent with the Palermo Protocol may use these definitions differently. This can result in widely varying numbers of detected human trafficking cases from country to country.

However, given the time, personnel, and budgetary constraints, detected cases of human trafficking may be the most viable unit of analysis for current research on human trafficking (UNODC 2016a). The analysis below highlights some of the issues with survey research on detected cases of trafficking and provides suggestions for mitigating these threats to maximize data quality. It also explores some alternative or supplementary data collection methods.
Self-Reporting Bias
The data used for the UNODC Global Report is collected from a questionnaire distributed to governments and from open-source information. Questionnaire self-reporting is subject to self-reporting bias, which may harm the quality of the data (Rosenman et al. 2011). The 2016 Global Report recognizes this in its “Annex” section on Methodology and Data Coverage. It also highlights precautionary measures taken to standardize the data set for measures used in cross-country comparisons. Nevertheless, self-reporting bias is a serious issue that may arise at three stages of the data collection process: (1) the actor/event stage, (2) the observer/agent stage, and (3) the state/principal stage (Ling 2014). Each of these represents stages of data transfer that trace the movement of data from beginning to its final destination, the Global Report. At each point, a new actor has an opportunity to perceive the data incorrectly or infuse it with his or her own personal bias. This section follows the data from its point of capture at the instance of trafficking to the collection by an observer to its reporting and analyzes the factors that may harm data quality along the way with an eye toward developing mitigation techniques to improve future reports.

The first stage is the actor/event stage. In this stage, the actor (the trafficker) causes the events that violate international law. Here, bias arises based on the observability of the event by law enforcement or other relevant first responders (Ling 2014). Observability of an event can vary, but small-scale events may be less likely to be detected than large-scale ones. Applied to examination of human trafficking cases, this can mean a variety of trafficking cases slip through the cracks (King 2011). For example, small-scale, highly unsophisticated human trafficking (like a family member selling a child out of the household for drugs) may go undetected more often than human trafficking that occurs in a well-established brothel. And on the alternate end of the spectrum, criminal syndicates may perpetrate trafficking crimes that go virtually undetected because of their sophisticated trade-craft. Other things that may impact observability are victim and observer characteristics (Ling 2014). For example, victims often do not self-identify out of fear of retaliation from their traffickers or out of unwillingness to relive painful experiences through court testimony or a detailed victim account. Additionally, observers, such as law enforcement, may be influenced by cultural and social mores, perhaps viewing certain instances of trafficking as benign because of their prevalence and acceptance in the community.

This means that within a country, bias in stage 1 may impact the ability of the data set to depict the reality of trafficking crimes perpetrated. Countries with higher rates of easily observable human trafficking appear to have higher rates of human trafficking overall, which may not be the case. This makes it extremely difficult to conduct accurate cross-country comparisons using self-reported data. Because of socioeconomic factors and infrastructural differences that make certain states more disposed to certain types of crime than others, this form of bias cannot be eliminated from a cross-country data set of detected human trafficking cases. However, with the proper cautionary notes in the reported data, a consumer can at least be aware of the potential for this form of bias and the likelihood that a certain country or region is especially susceptible to it.
The second stage is the **observer/agent stage**. In this stage, an observer aware of an event evaluates whether an event meets the reporting criteria, decides whether to report, and then submits the report (Ling 2014). The quality of data in this stage is impacted by (a) agent reporting incentives, (b) clarity of the reporting criteria, (c) effectiveness of the reporting channels, and (d) agent perception of the principal’s ability to detect an inaccurate report.

First, agent reporting incentives can either explicitly or implicitly inform an agent’s ability to accurately report data. An agent’s understanding of and knowledge about human trafficking influences whether or not she/he views a case as reportable. But other reporting incentives also come into play (King 2011). For example, a law enforcement agent may have an overreporting incentive to demonstrate his or her agency is tough on crime. Or a nonprofit may have an underreporting incentive to demonstrate to potential donors the positive impact the organization is making in the community. Bribery, corruption, and complicity may also impact the willingness of a law enforcement official to report a trafficking instance. In other words, there are countless ways agent reporting incentives may bias data at the observer/agent stage (Tyldum 2005).

The second potential self-reporting bias at the observer/agent stage is clarity on what to report as a human trafficking case, especially given the multiple definitions of human trafficking that are utilized by international bodies, nongovernmental organizations, and states. For example, some countries do not differentiate between human trafficking and smuggling – thereby encompassing in trafficking estimates the number of individuals who use services of smugglers to migrate (Jahic 2005). When different definitions of trafficking are used by different agencies, counts of human trafficking cases and victims will be inconsistent. Some may be based only on known cases receiving certain types of assistance (e.g., persons in voluntary assisted return programs or those that enter trafficking victim shelters), while others may be based on victims testifying in criminal cases. Additionally, what justifies a report may vary by country or even by reporting agent.

Third, the effectiveness of reporting channels may also vary significantly and bias the data at this stage (Ling 2014, 11). Countries with more sophisticated data reporting infrastructure, including digitized record keeping and computerized data portals, ease the burden of reporting. This may result in more crimes being reported relative to less technologically sophisticated countries or localities, once again biasing the reported data. Finally, agent perception of the principal’s ability to detect an inaccurate report may impact data collection accuracy at this stage. This means an agent may suppress or inflate event counts due to what he believes the principal needs to understand the data set.

In the third stage, the **state/principal stage**, the state (or principal) receives reports submitted by agents, evaluates these reports, and decides what reports to submit to the data-collecting body (the UNODC). The causes of reporting bias at the state level are essentially similar to the observer/agent level: reporting incentives, ability to detect inaccurate reporting by the agent, clarity of criteria, and reporting effectiveness. However, the reporting incentives here are different. The state may
wish to underreport the crime so as to not deter foreign investment, tourism, or otherwise jeopardize its international image. On the other hand, the state may report numbers that signal they are tough on the crime so as to deter other criminals and gain positive reputational benefits from the international community.

In sum, although there are countless ways bias can enter the survey data utilized by the UNODC, an understanding of precisely where data quality is harmed can inform effective changes to the survey (Biemer 2003). Despite budget and time constraints, there are questions and commentary that can be added to the existing survey, and disclaimers that can be added to the published report, that will allow the reader to more accurately interpret the results. The following analysis discusses potential amendments.

Potential Amendments

Minimizing the Effects of Self-Reporting Bias

Despite the limitations of self-reported data, it is imperative to “mitigate its effects when possible, and to assess its impact when mitigation is not possible” (Ling 2014, 22). The following section examines options to mitigate the effects of self-reporting bias at each of the stages in which it may enter.

In stage 1, the actor event stage, bias mostly stems from the observability of events. Non-detection of relevant events induces the bias. It would be nearly impossible to eliminate observability bias at this stage, so the next best option is to control for the effects, which would be very difficult since its impact on the data is unknown and arguably unknowable. Thus, to address observability bias, the report must alert the reader to instances where the bias may be particularly high. Although the 2016 Global Report gives a cautionary note in its “Global Overview” section, it does not alert the reader to instances throughout the report where observability bias may be higher in a certain region or state on average than in other states. This improvement would allow readers to better understand and interpret the data presented.

In stages 2 and 3, the observer/agent stage and the state/principal stage, the most significant improvements can be made by the UNODC in “clarity of reporting data.” There are a few questions on the 2016 questionnaire that are likely to produce unreliable data given the lack of clarity in the question wording. Different people completing the survey in different countries may interpret the questions very differently. For example, question 2 asks for the number of persons brought into “formal contact with the police and/or criminal justice system,” defining “formal contact” as “suspected, arrested, or cautioned.” With no objective definition of formal contact, the data collected from this question is likely to unreliable. It would be clearer to use one objective measure of formal contact, such as the number of people arrested, to obtain the most reliable data. Each question should be scrutinized to ensure that the wording is simple, objective, and applicable across different country contexts and criminal justice systems and reporting infrastructures.
Non-survey Data Supplements

The 2016 Global Report suggests that multiple systems estimation (“MSE”) is the aspirational methodology for future data collection. MSE would reduce observability bias in the data set by extrapolating from known cases of human trafficking to estimate the unreported number of trafficking victims. MSE measures the overlap between different victim lists and estimates the percentage of victims that go undetected from the lists. This amount of non-detection is used to extrapolate a number of total undetected victims in the measured population, which roughly captures the “shadow number” of victims that go undetected in the current examination of detected cases.

MSE has been piloted successfully to measure other types of illicit crimes, and it has been applied in the context of human trafficking on smaller scales to answer narrower research questions. It has been used to estimate demand for prostitution in Oslo (Cruff et al. 2017), casualties of human rights violations in Peru (Lum et al. 2012), intravenous drug users in Scotland (Hay and McKeeganey 1996), demand for prostitution in 15 different US cities (Roe-Sepowitz et al. 2016), homeless people (Fisher et al. 1993), and victims of domestic violence (Oosterlee et al. 2009). Also, the International Labour Organization has used MSE for its global estimates of numbers of persons in forced labor (ILO 2006).

In addition to using MSE as a methodological enhancement, the Global Report could also supplement survey data with qualitative data (Goździak 2008). This mixed-method approach gives insight to cultural and social influences affecting trafficking that may not be reflected in pure quantitative data. The various reports have attempted to compensate for the scarcity of quantitative data in certain regions by collecting qualitative data from UN peacekeeping operations and mission reports from UN Special Rapporteurs. Qualitative data provides a degree of nuance and insight that often is forgotten in the process of quantitative data collection. Thus, qualitative data could be leveraged as a supplement beyond only those regions with sparse data. For example, the UNODC’s Human Trafficking Knowledge Portal includes a case law database with about 1500 human trafficking cases across over 100 jurisdictions globally. This case law data can be leveraged by the Global Report to provide examples and context for as many countries as possible.

In addition, the UNODC could supplement its data set by collaborating with other NGOs and IGOs that collect trafficking data. For example, the Counter-Trafficking Data Collaborative developed by the International Labour Organization (ILO) and Polaris Project collects data on 62 different variables that capture information on victim profiles and the human trafficking event itself. The current data set includes this information for “over 47,000 victims of at least 43 different nationalities, exploited in at least 52 countries” (CTDC Data Codebook 2017). This database, although nascent, could provide valuable insights into victim profiles or at least serve as a launching pad for more in-depth research or case study analysis of certain types of victims.

Another potential data source is satellite imagery to identify trafficking hubs (Boyd et al. 2018). This technology has been used to identify brick kilns in India’s “Brick Belt,” and this data is used with a multiplier of estimated average forced labor
victims in kilns to develop a rough estimate of the total number of trafficking victims in the Brick Belt. Although this data is likely not easily transferrable to estimating other forms of trafficking (brick kilns have a distinct shape and thus are readily visible on high resolution satellite data), the data gathered from this study could be used to cross-check reported numbers of trafficked laborers in some Southeast Asian countries or to develop a case study of a particular type of trafficking in a country.

Walk Free Foundation’s Global Slavery Index uses survey methodology to measure prevalence of human trafficking globally. Rather than surveying state bodies (as the Global Report does), the Global Slavery Index is based on public opinion surveys. They have contracted with Gallup International to field 25 surveys, interviewing more than 28,000 respondents in 52 different languages. The Global Report should consider how to measure its estimates against those produced by the Global Slavery Index.

Data Presentation

Purpose Statement
The 2016 Global Report, although narrated in relatively accessible language, is more than 120 pages of charts and graphs, broken down by region. The data are extensive and relatively dense, yet formatted in a user-friendly manner, utilizing colorful graphics to present data and intermittent artwork. The disclaimers about reporting methodology and data quality are contained in an “Appendix” instead of embedded in the text of the report itself. This format lacks the technical detail on data analysis likely to be sought by an academic research scholar, but is still too technical for a casual consumer or antihuman trafficking advocate. Without a purpose statement opening the 2016 Global Report, the intended consumer of the report’s information is unclear.

The “Introduction” and “Preface” of the 2016 Global Report both imply that the report’s purpose is to define the contours of the global human trafficking problem as a step toward eradicating it. It states that “to have tangible success against the criminals, to sever the money supplies, to entertain joint operations and mutual legal assistance, we must first understand the texture and the shape of this global challenge. The Global Report does exactly this” (UNODC 2016a, 1). However, in its “Global Overview” section, the report also states that, in light of the limitations of the data, it “does not use these data to estimate the size of the [trafficking] phenomenon, nor to conduct cross-country comparisons in terms of the severity of the trafficking” (UNODC 2016a, 39). This statement is somewhat at odds with the statements in the Introduction and Preface, which imply that the report’s purpose is to measure and then combat trafficking, and is also at odds with the section on “Patterns of Trafficking in Persons,” which compares data from multiple countries to analyze trends.

A clearly defined purpose statement should identify both the intended uses of the data and the intended audience. The publication is in response to the General Assembly Resolution directing the UNODC to research the global effects of human trafficking (A/RES/64/293 2010). But a purpose statement for the report
would serve to provide clarity to the researchers and consumers of the product. For example, if the purpose of the report is to accurately define the contours of the human trafficking problem, the survey should be revised to minimize self-reporting bias (in ways previously discussed), the report should provide disclaimers when data is less accurate, and the report should provide cross-country analysis so that the consumer knows that the data is aimed at presenting a (albeit incomplete) picture of the global reality of human trafficking. On the other hand, if the purpose is simply to assess the capacity of states to detect trafficking within their borders, the report could continue using a simple survey and omit disclaimers about data quality.

**Potential for Dual Functionality**

Although the current *Global Report* does not have a “naming-and-shaming” purpose or function, such an element could be a low-cost, valuable addition. Currently, there is no UN-administered compliance report to assess the success of states implementing the Palermo Protocol. The US Trafficking in Persons Report (TIP Report) fills a similar function by ranking countries by compliance with international standards on combatting human trafficking and instituting unilateral sanctions against noncompliant states.

The contribution of the TIP Report to global consensus building on the issue of human trafficking is indisputable. The author of one of the seminal studies on international anti-trafficking efforts herself noted (despite her criticisms of the US influence in this area) that she directly observed multiple instances of positive policy change while working with member states of the Association of Southeast Asian Nations from 2003 to 2010. She noted, “the open threat of a negative grade in the U.S. TIP Report provided the impetus for major reform initiatives, including the criminalization of trafficking, decriminalization of victims, changes in penalty structure for trafficking...and the opening of shelters” (Gallagher 2010, 485). Based on movements of countries within the TIP Report ranks, it seems that more and more countries have come into compliance with international law since the institution of the ranking system. Since the enactment of the US anti-trafficking law, the Trafficking Victims Protection Act, in 2000 that mandated the annual publication of the TIP Report, the number of countries at Tier 1 (full compliance) has more than doubled (Tiefenbrun 2007). There has also been a steady increase in the number of countries at Tier 2 and a corresponding decrease in the number of Tier 3 countries – from 23 in 2001 to 12 in 2006 – due to measures taken by foreign governments to comply with the minimum standards.

If the UNODC report adopted a similar naming-and-shaming element in its *Global Report*, it could fill a gap in the international compliance regime for antihuman trafficking efforts. This would add teeth to the human rights regime undergirding international law on human trafficking, creating the potential for serious reputational consequences for noncompliant states. The addition of a naming-and-shaming mechanism would strengthen the Palermo Protocol and would have a lasting effect on anti-trafficking policy that is more likely to be internalized by state parties to the Palermo Protocol. Practically, this would not considerably change the current form of the *Global Report*. The addition could
merely be a section highlighting noncompliant states and states that have come into full compliance with the Palermo Protocol. Or it could consist of an annex with a more extensive ranking system similar to that of the TIP Report, classifying countries into tiers based on the degree of compliance with international standards. This addition could be a highly valuable use of “scorecard diplomacy” with the potential to spur member states toward developing anti-trafficking institutional infrastructure, a result that has been seen in response to the TIP Report (Gallagher 2010). In fact, in many countries, the TIP Report has led to the establishment or improvement of anti-trafficking institutions such as judge and law enforcement training, victim shelters, and increased trafficking prosecutions and convictions (Kelley 2017). The international anti-money laundering compliance regime – the Financial Action Task Force (FAFT) – has used similar scorecard diplomacy backed up by multilateral, G7 sanctions with considerable success. Some scholars have suggested the UNODC follow suit (Bravo 2011). Before sanctions are imposed by the FAFT for non-compliance, states are encouraged to open a dialogue with the institution, and it provides advice and technical cooperation to aid the country in implementing domestic anti-money laundering measures. A similar, UNODC-administered “scorecard” could raise the stakes for the development of domestic anti-trafficking measures while ensuring states have a resource for informed, guided policy-making. Notably, a UNODC compliance mechanism within the Global Report could also serve as a “check” on the US TIP Report, which has faced some criticism for being politically motivated (Chuang 2005).

One possible problem with the proposed addition is its potential to increase survey non-responsiveness. Institutional theorists argue that the choice of conformity or resistance to institutional pressures is a strategic choice affected by organizational interests, such as efficiency or acquisition of resources (Oliver 1991). These interests may cause institutions to conceal nonconformity with international norms, responding symbolically and buffering themselves from international attention. A state may alternatively reject institutional norms or expectations in defiance of institutional pressures altogether, or they may even adopt an aggressive posture toward institutional agents and attempt to manipulate or actively exert their sovereignty over international institutional pressures. These possibilities will have to be weighed against the considerable value of adding a ranking system to the UNODC’s Global Report. Of course this change would likely need to emanate from the General Assembly, as the current report’s purpose is centered around the directive of the 2010 General Assembly Resolution to measure and assess the scope of the trafficking problem.

**Conclusion**

The Global Report is an important and ambitious project that endeavors to provide a data-driven understanding of the global human trafficking problem (Gallager 2011). A few methodological limitations impede it from being as impactful as it could be. With a few low-cost modifications – including a clearly defined purpose and target audience, simplified survey language, collaboration with other NGOs and IGOs that
are doing similar work, and the addition of more qualitative data from the UNODC case law database – the report could become invaluable to the global community in its efforts to end human trafficking. Finally, the UNODC should consider the opportunity for dual functionality of the report so that it would not only measure and assess the scope of the global human trafficking problem but also spur the international community toward internalizing antihuman trafficking norms.

Abstract

This chapter outlines ethical considerations for doing research on human trafficking. It presents ethical challenges not only for interacting with and studying the experiences of trafficked persons and their communities but also for describing, explaining, and presenting trafficking as a social problem more generally. An ethical approach to trafficking research includes giving considerable thought to how a study is designed, ethically negotiating access to respondents, being honest about how the researcher’s social position and emotional reactions to respondents in the field will impact findings, and being diligent about recognizing ethical conundrums as they arise. The chapter begins with how researchers might consider the ethical implications of their research design, negotiate access, and address their positionality. It then turns to practical suggestions for trauma-informed and culturally sensitive data collection, in addition to guidelines for ethically representing and disseminating findings.

Human trafficking research shapes how policymakers, practitioners, and civil society understand it as a contemporary social problem. This chapter identifies challenges for researching trafficking with a focus on ethical considerations—not only while engaging with trafficked persons or other respondents but also for describing, explaining, and presenting trafficking as a social problem more generally. In addition to being transparent about the difficulty of estimating trafficking’s prevalence (see chapter “Measuring Trafficking in Persons Better: Problems and Prospects” by J. Van Dijk), trafficking researchers have a responsibility to evaluate whether their methods reproduce oversimplified or inaccurate trafficking narratives (see chapter “Using Law Enforcement Data in Trafficking Research” by E. Cockbain, K. Bowers and L. Vernon) and to safeguard the well-being of their respondents and affected populations.

Researching human trafficking raises the same ethical questions that exist in all empirical research, regardless of who or what is being studied. But as is recognized by others studying disadvantaged populations, research on trafficking raises additional ethical considerations about how to study seemingly vulnerable populations such as children, prisoners, and displaced persons (see e.g., Bosworth and Kellezi 2016; Aldridge 2017; Sutton 2017). Furthermore, because research on trafficking intersects with culturally “sensitive” domains including gender, sexuality, sex work, criminality, and legal status, this can make study participation uncomfortable or risky. The impact research has on respondents and ensuring they are given their own voice should be constantly evaluated (Brennan 2005; Brunovskis and Surtees 2010).

Though research about trafficking has increased in recent years, this does not necessarily ensure a deeper understanding of why trafficking occurs, how it impacts affected populations, or how the issue should be addressed. A large number of studies on trafficking show selection bias, and omit important details about sampling procedures, the limitations of their data, and draw from unsubstantiated claims (Zhang 2009; Brunovskis and Surtees 2010). Trafficking research can be substantially improved by carefully considering how to ethically access trafficked persons and their communities and by being increasingly mindful about how and to what effect findings are presented, both for those who participated in the study and those affected by counter-trafficking policy and practice more broadly (Morrow and Boyden 2014; Waldram 2015).

**Methods and Research Design**

This section considers the ethical implications of how researchers make decisions about their research design. Social constructions, research paradigms, and prominent theories can drastically influence how and why researchers study problems, who they include as respondents, the kind of questions they ask, and the methods they use.
Biases and assumptions about what trafficking is, how it works, and who it affects may appear in a research design early on (Flick 2007; Brunovskis and Surtees 2010). Regardless of intentions or experience, researchers have a responsibility to critically analyze their biases and assumptions from the beginning, keeping them in mind as they develop research questions, plan their methods, and conduct fieldwork. Factors such as funding, access, time, and methodological expertise tend to have an impact on how studies are designed and cannot always be ignored. Nonetheless, researchers should ask themselves the following questions early in the design process:

- **What assumptions am I making about how, why, and to whom trafficking occurs?** How human trafficking is constructed by policy, mass media, and research deeply impacts assumptions about what it looks like, how it works, who it affects, and why. Thus, researchers may begin their studies with stereotypes about the people they will encounter and preconceived notions about what trafficked persons have experienced (Zimmerman and Watts 2003). Too often, these ideas are fueled by sensationalist media coverage of exceptional cases and are biased or based on faulty evidence (Zhang 2009; Houston-Kolnik et al. 2017). For this reason, researchers should consider how their assumptions might impact their research design and whether these are evidence-based. What assumptions are being made about the race, age, class, or gender of trafficked persons? What are the researcher’s expectations about what trafficked persons want, what justice looks like, or how they make sense of what happened to them? Regardless of methodology or orientation, researchers should recognize their assumptions, ensure their study is not dependent on faulty depictions, and consider how they might challenge assumptions about trafficking rather than reproduce them (see Cwikel and Hoban 2005).

- **Who will I involve in the research design?** The stakeholders involved in research design will ultimately play a vital role in the types of questions being asked, how the data is used, and for whom it will be useful. Academically trained researchers have substantial training in methods and the analytic skills needed to design and conduct rigorous research, and may be well versed in academic theory. However, they may not be experts on the community they study or how their research can be useful beyond scholarly theory building. Community organizations and trafficked persons, on the other hand, though they may not have rigorous research training, have a long-term interest in the community and often bring unique perspectives to the study that scholars would otherwise fail to consider. Researchers should give strong consideration to whose interests are being privileged in their design and how the study might be improved to benefit the community (see UNIAP 2008).

- **Have I designated enough time, resources, and funding to collect and analyze my data ethically and accurately?** Funding a study on trafficking can be timely and costly, perhaps even more so when incorporating strong ethical guidelines. Researching disadvantaged populations requires cultural- and trauma-informed sensitivity (Brennan 2005), and there is always a strong possibility studies will be faced with time delays and complications leading to costly but necessary adjustments. Moving forward with
a study without the knowledge and resources to carry it out ethically is potentially harmful, both to respondents and to the study’s overall validity. For this reason, researchers should carefully consider the feasibility of whether they can carry out their proposed research design in an *ethical* way using the limited time and resources available to them.

For example, interviewing trafficked persons one after another in a location available to the researcher for limited cost may be a practical and cost-effective interviewing strategy. However, this approach may make respondents less comfortable than if their interview was conducted over multiple, shorter visits at a location they choose themselves (preferences vary). Similarly, asking a colleague, respondent family member, or neighbor to translate during interviews may be more convenient and less costly than hiring a professional, but the latter better ensures the interview is translated accurately and remains confidential.

*– Is my study intended to be representative of a certain group? What perspectives are being privileged?*

As is the case with any study, researchers must make decisions about who to include in their study and why (Flick 2007). Sometimes these decisions may unintentionally contribute to selection bias if not considered carefully. Existing studies on trafficked persons often overgeneralize or make assumptions about specific types of experiences; this should be avoided (Tyldum and Brunovskis 2005; Brunovskis and Surtees 2010; Weitzer 2014). Studies of trafficked persons who are receiving services or have been counted in a government database, for example, cannot be said to be representative of all trafficked persons because not all victims seek assistance nor are all types of trafficking cases equally identified by law enforcement or service providers (Farrell and Pfeffer 2014).

Trafficked persons are not a homogeneous group; their experiences vary according to multiple factors, and findings may differ depending on whether they are interviewed during, immediately after, or many years following their trafficking experience (Brunovskis and Surtees 2010). If conducting in-depth interviews with young women who experience sexual exploitation on the streets of an urban European city, for example, these findings should not be used to generalize the experiences of trafficked persons who are older, aren’t female, have received services, live somewhere else, or have experienced exploitation in a different way. This does not mean that studies need to be all inclusive but that researchers should be fully transparent about exactly which aspect of trafficking their sample represents, who it does not represent, and how this impacts their conclusions.

*– Must my data come directly from trafficked persons? If not, how might this limit survivors’ ability to share their own points of view?*

Collecting data directly from trafficked persons often seems like the most straightforward strategy for research on trafficking, but it is important to consider whether doing so is necessary for every study. There are limits to studying trafficking exclusively through individual victim interviews, which come with their own ethical conundrums related to accessibility, safety, and risk of stigmatization or re-traumatization (Brunovskis and Surtees 2010). It is essential
Trafficked persons have the opportunity to share their own points of view, but they should not be required to carry the burden of answering research questions if this poses risks or if the questions under study can be answered in another way. Therefore, unless a study is specifically interested in the trafficked persons’ own perspectives, it may not require in-depth interviews with trafficked persons themselves. Researchers should consider alternative options, such as gathering information from gatekeepers, documents, or existing data sets. While these data points do not speak to the perspective of trafficked persons, they can provide valid information useful for analyzing trafficking patterns, counter-trafficking efforts, and policy responses.

**Negotiating Access**

Though often overlooked, negotiating access is as an essential aspect of ethical research planning (Doykos et al. 2014; Jefferson 2015; Monahan and Fisher 2015). Once a research plan is established, the first step to conducting fieldwork is to acquire access. Establishing contacts and gaining site permission can be time-consuming, stressful and may require creative problem-solving. The effort that goes in to building rapport with respondents and communities is critical and should not be treated as a mere “check box” of study design. Gaining access often requires negotiating with “gatekeepers” – community leaders, officials, social service providers, parents/guardians, or others – who are already in the community and have access to potential respondents of interest (Monahan and Fisher 2015). It is essential there be a plan for negotiating access prior to entering the field that includes recognizing potential barriers and how to ethically overcome them. The following questions should be considered:

- **Who are the gatekeepers at my research site? How do I plan to interact with them?**

  Gatekeepers can be instrumental for enabling access and providing guidance about how to communicate with unfamiliar or hard to reach groups (Thorburn 2017). Who the gatekeepers are will depend on the site. For studies on trafficked and exploited populations, this may include people complicit in trafficking activities, such as recruitment agencies, employers, corrupt officials, smugglers, or it may consist of community stakeholders, local leaders, social service providers, legal professionals, health care workers, or law enforcement. In the case of children, gatekeepers may be a non-complicit or unknowing parent or guardian.

  Once contact and trust are established, gatekeepers may be happy to share their expertise and help navigate local dynamics. Without the help of a gatekeeper, blindly walking into a site or situation where suspected trafficking occurs and starting to ask questions may initially seem harmless (or courageous) to an outsider but potentially puts the research team and potential respondents at risk of unnecessary harm. Unless the researcher has already built relationships in the field, gained the trust of key gatekeepers, and gained an appreciative
understanding for how they might be perceived by the community, it is unlikely they will be able to predict or discern potential risks on their own or access and properly analyze the in-depth information they are looking for.

Building trust with gatekeepers can be a frustrating process. Scholars studying trafficking often face difficulties “getting passed” gatekeepers who restrict access to clients, children, detainees, and community members (see e.g., Ahsan 2009; Brunovskis and Surtees 2010; Thorburn 2017). Under these circumstances, researchers may perceive gatekeepers as a hindrance, becoming frustrated or suspicious when gatekeepers are overprotective or uncooperative. Traffickers, employers, law enforcement, or migration officials may restrict access because they are suspicious of outsiders, concerned about what respondents might say, or see the proposed study as irrelevant to their own interests. But researchers should bear in mind that simply because a gatekeeper is guarded or protective does not mean they do not have a reasonable justification for doing so (see Brennan 2005; Brunovskis and Surtees 2010). When access is being sought with trafficked persons after they’ve recently left an exploitative situation, for example, social service providers, advocates, and family members may be cautious and protective of them for good reason, particularly if the researcher is unknown to them or they have had negative experiences with requests in the past.

As reports about human trafficking increase in the media, gatekeepers are often overwhelmed with requests for access to clients and concerned about protecting respondents from additional exploitation, harm, or secondary trauma (Brennan 2005). Indeed, those who work with trafficked persons often recognize that it can be tiresome and overwhelming for their clients to participate in interviews over and over again, whether with researchers, journalists, law enforcement or in court (see Chap. 15, “No More Interviews Please”: Experiences of Trafficking Survivors in Nepal,” by R. Dhungel). Therefore, even when researchers have good intentions and see themselves as objective and trustworthy professionals, this does not mean gatekeepers will (or should) automatically trust them. From the perspective of the gatekeeper, it is the researcher who is an outsider and worthy of suspicion.

Participation in a study can be time and labor intensive and may not always result in direct benefits. For this reason, it’s important to begin building trust with gatekeepers early on, open lines of communication, and come up with creative ways to ensure a study is beneficial to all involved. Taking the time to meet with gatekeepers to discuss the project and answer their questions is a good first step. If working with a formal organization, it may be helpful to prepare a summary of the study ahead of time that includes a formal request for cooperation, an outline of what is expected, and steps the researcher will take to ensure respondents benefit from the process (see Brunovskis and Surtees 2010).

- What are the risks and benefits of working with gatekeepers (or not)? What limitations might I face in the process?

Though it is helpful, collaborating with gatekeepers can also be fraught with ethical and methodological challenges (Reeves 2010). For example, gatekeepers may offer to provide access to clients or the community only if the researcher
assists them with some kind of service through reciprocity. While there are potential benefits to this arrangement, there are also risks, including ethical ambiguities about informed versus coerced consent, unclear lines about what counts or does not count as research, and issues with censorship (Monahan and Fisher 2015). Another common dilemma is that gatekeepers may restrict access or place restrictions on the types of questions the researcher is allowed to ask in order to protect respondents from intrusive requests they believe are harmful. In restricted situations such as these, it can be difficult to negotiate a balance between respecting the gatekeeper’s concern about protecting respondents from harm and the respondent’s right to speak about matters affecting their own lives on their own terms (Ahsan 2009; Burgess-Proctor 2015).

Power dynamics between gatekeepers and potential respondents can also complicate recruitment and informed consent procedures. In situations where gatekeepers agree to present study information to potential respondents on behalf of the research team (e.g., to protect clients’ privacy), researchers have little control over how study information will be filtered through the perspective of the gatekeepers and whether this has a direct influence on whether respondents participate. While conducting multiple studies among trafficked persons in Europe, for example, Brunovskis and Surtees (2010) successfully negotiated with gatekeepers, but some agencies appeared to only pass study information to their “successful cases,” neglecting to do so for clients who were struggling or considered “unsuccessful.” Ultimately, this type of filtering contributes to selection bias.

Even when gatekeepers are clear with potential respondents that it is their choice whether or not to participate in a study, there may also be power dynamics affecting respondents’ choices in more subtle or inadvertent ways. Some respondents may fear that by participating in a study, they are pleasing or displeasing the very people they rely on for basic services. Similar barriers may occur when seeking access to youth whose parents are not aware their child was exploited (Thorburn 2017) or when collaborating with gatekeepers complicit in exploitation (e.g., recruitment agencies, factory owners). Just as recruiting respondents through a social service agency may only produce trafficked persons who represent “successful cases,” interviewing those in places of exploitation may be biased toward only including trafficked persons with freer conditions, who are under less control, or have less to fear (Brunovskis and Surtees 2010).

What expectations do I have about the type of data my site will provide? Is it possible to ethically access the data I need to answer my research questions? If not, what compromises am I willing to make?

Researchers should consider exactly what kind of data they need to systematically answer their research questions, whether they can gain access to a site that can actually provide that data, and whether it is possible to do so ethically.

The ideal study for a researcher interested in the effect of trafficking on family dynamics, for example, might be to observe a survivor and their family while the researcher stays in their home or community (not unusual for social scientists studying families). But this may not be ethical or possible if trafficked persons they encounter feel it is too intrusive, family members are not aware of their
trafficking experience, doing so is culturally inappropriate or overly conspicuous, or potentially contributes to stress or additional stigma. Similarly, while a researcher may wish to interview trafficked persons one-on-one without their case manager or counselor present to ensure respondents can speak freely, a gatekeeping organization may insist this is inappropriate out of concern for re-traumatization and refuse to negotiate. Researchers should be prepared to decide how willing they are to adjust their expectations and how this may affect who they gain access to and who they do not.

Is there anything I don’t want gatekeepers or respondents to know about my research? What are the ethical implications of withholding this information? There may be circumstances in which researchers want to conceal their study objectives or researcher status from the community they are studying. Formally, these issues are often addressed to some extent by university or academic ethics committees (e.g., Institutional Review Boards), but controversy remains over whether deceiving respondents could ever be fully ethical even if the research is socially important (Monahan and Fisher 2015). Furthermore, ethics committees do not typically regulate more subtle and nuanced ways in which research objectives are obscured from gatekeepers or study participants, and how this might affect respondents or long-term access to the community once the researcher has left.

Perhaps most common is when researchers do not want to make their political or personal views known to respondents who have a different perspective than they do – out of fear that this will disrupt rapport or how truthfully respondents answer their questions. Trafficking is not a politically neutral topic and is closely related to a number of politicized issues such as prostitution, migration, sexuality, and labor rights. While maintaining neutrality is generally positive for seeking unbiased results, difficulty may arise if respondents or gatekeepers ask researchers outright about their political opinions or are suspicious of a study and inquire to know what the researchers’ hypotheses or intentions are (e.g., see Bosworth and Kellezi 2016). A similar dilemma may arise if respondents or gatekeepers assume the researcher holds the same or different opinions as they do even when this is not the case.

What ethical obligations do researchers have to correct them? Is it ethical to only make opinions known to those who agree? What will happen if/when respondents later read the study and discover the researcher was not forthcoming about their position?

Answers to these questions are never easy and may not reveal themselves until a study is already underway. Researchers and study teams should be prepared and consider exactly what information should not be disclosed, why, and how they will address it if it arises. Rather than coming up with a response in the moment, study teams can develop scripts of responses they feel are appropriate. While some researchers are adamant that under no circumstances should researchers be untruthful, others work on strategies for doing their best to minimize obscurity while pursuing data that is otherwise unavailable (see Monahan and Fisher 2015).
What is my action plan for ensuring my own safety and emotional well-being? What about those who assist me?

With so much attention given to protecting the well-being of study respondents, researchers may not give enough thought to how they will keep themselves and those they work with safe. Regardless of a study’s site or location, researchers should be proactive and undertake a risk assessment as part of their overall research design, not only considering their own safety but that of research assistants, translators, and host organizations. Considerations might include conducting interviews in pairs or in public places (when possible) and carrying a mobile device for sending texts upon arrival and departure from a site (Dickson-Swift 2017).

Emotional impact is inherent to the research process (Kleinman and Copp 1993). Not only does research on trafficking cover sensitive topics, but data collection and analysis can be emotionally exhausting as more and more respondents entrust the researcher with their own emotional experiences and later when these accounts are revisited for analysis (Jewkes 2011; Piancanten 2015; Sloan and Wright 2015). Such intense emotions can cause distress and in some cases may make respondents feel uncomfortable if researchers’ emotions become clear during data collection (Bosworth and Kellezi 2016). For these reasons, it is crucial for researchers to acknowledge this reality early on, so they are not caught by surprise. Guidelines to help with this process include debriefing regularly with supervisors or colleagues, arranging for emotional support from a qualified professional, establishing a way to maintain boundaries between researcher and participants, and creating space for “stepping away” from the intensity of research when major challenges arise (see Sloan and Wright 2015; Dickson-Swift 2017).

The Researcher’s Position

Researchers should recognize how their own positionality – that is, their experiences, gender, age, sexuality, ethnicity, social class, and so on – will shape their interactions, impact the lives of their respondents, and affect interpretation and presentation of their data (Manohar et al. 2017). Reflexivity, ongoing consideration of one’s personal or political position in connection to the issue they study, is equally important. This does not mean focusing so much on the researcher’s journey of discovery that this sacrifices opportunities to understand respondents’ points of view but to consider how the researcher can overcome assumptions or misgivings caused by their interactions (Cobb and Hoang 2015).

Regardless of whether doing research on trafficking in one’s own community or one across the world, being reflexive about the dynamics of positionality helps researchers avoid invalid generalizations, recognize their limitations, and conduct more accurate, transparent, and ethically grounded work (Jewkes 2011). Researchers should consider the following types of questions:
What beliefs and feelings do I have about my study’s target population? What do I feel conflicted about and why?

In order to gain insight into potential moments of discomfort or miscommunication, researchers should be honest with themselves about their opinions, biases, beliefs, and emotions related to their study topic, the population they are studying, and how they see themselves in relation to their respondents (Gillies and Alldred 2012; Seal 2017). For trafficking research this may include opinions about gender roles, undocumented migration, child labor, or sex work.

No one, regardless of status, is immune from bias (Guillemin and Gillam 2004; Doykos et al. 2014). Ambiguity and mixed feelings during research are common, especially when topics are sensitive or controversial. Biases do not have to be clearly positive or negative; they may include whether the researcher feels conflicted or uneasy about their topic or setting. Such feelings and attitudes are often shaped by one’s socialization, political allegiance, religion, gender, sexualitv, ethnicity, social class, and age rather than individual attitudes. It is not wrong to have feelings nor is it possible to necessarily get rid of them. Rather, researchers should reflect on and acknowledge their feelings and biases in order to identify how they might be triggered and how they may ultimately influence respondents and the research process (Manohar et al. 2017).

How might similarities and differences with respondents impact objectivity? How might my positionality impact power relations and what respondents expect from me?

Too often, researchers do not give their positionality in the field enough ongoing attention, or they focus too much on more obvious differences with respondents (e.g., race, ethnicity, or religion) while ignoring more nuanced ones. Researchers are expected to be neutral but nonetheless carry multiple identities which have the potential to create power dynamics with respondents. Similarity and difference with respondents across these identities can affect participants’ consent, expectations, and overall rapport, whether intentional or not. If left unexamined, these may contribute to reproducing inequality or reporting inaccurate findings (Burgess-Proctor 2015). With this in mind, researchers should reflect on how their similarities and differences impact the social worlds of their respondents, how this potentially affects study dynamics and adjust as needed.

Considering similarity with respondents can be just as important as considering obvious differences. That is, “insider” status in a community is typically understood as positive but also comes with challenges (Staples 2001). Whereas power dynamics due to gender or racial differences may be obvious (e.g., male researcher interviewing a female about sexuality) or economic differences might lead respondents to think researchers have the power to help their situation (e.g., remove them from an exploitative workplace, provide legal services), similarities between researcher and respondent can equally contribute to unspoken expectations of camaraderie, or to anxiety about judgment. For example, female respondents may have particular expectations about the political position or ideology of a female researcher (Seal 2017) or worry about what a female researcher thinks about her gendered behaviors (e.g., sexual promiscuity, expectations of motherhood). Similarly, respondents of the same religion may assume the researcher will
only report findings about their religious practices in a positive light, or respondents from the same neighborhood as the researcher may have concerns about confidentiality. Of course, identities are multidimensional; a Latina researcher who lives in Los Angeles, for example, though ethnically and/or racially similar to other Latina respondents might in some ways be seen as an “insider” but should also consider dynamics of her “outsider” positionality across boundaries of class, level of education, or nationality – whether the study takes place across town or in another country. The point of considering positionality is not to attempt to eliminate difference or similarity but to consider how these impact the study process and to reduce unspoken expectations to the greatest extent possible.

Do I plan to maintain my observer status? What is my plan of action if I feel obligated to intervene in a difficult situation? Am I aware of the potential consequences any intervention might have on my respondents?

Human trafficking researchers may find themselves in difficult, uncomfortable, or tense situations, including witnessing illegal acts, interviewing respondents who are distressed, and observing situations where respondents or community members appear to be in harm’s way. Indeed, situations such as these have ethical and perhaps legal implications. Thus, researchers should have a thorough plan of action and a working relationship with local service providers or other resources for when situations such as these present themselves. The extent to which a researcher chooses to maintain objectivity or intervene in circumstances is ethically complex (see e.g., Zimbardo 1973; Guillemin and Gillam 2004), but researchers should at the very least refer to their discipline’s code of ethics for guidance.

Regardless of one’s position about if or when to intervene, human trafficking researchers should be extremely cautious about staging any kind of “rescue” operation, particularly without the consent of the victim(s) involved. It is important to be prepared to provide emergency assistance if requested, but for a multitude of contextual reasons, this may not involve the type of intervention the researcher assumes is best. Indeed, failing to respect a respondent’s position on whether intervention is desired or necessary, regardless of the researcher’s intentions, can leave them in worse situations than before (Zimmerman and Watts 2003). When in doubt, find local resources to help assess the situation. It is essential to respect local service providers’ assessment of difficult situations and viable assistance options, even when these options seem dissatisfying to the researcher. Overstepping boundaries, such as contacting authorities when asked not to do so, or disregarding the input of local actors, can create distrust between those who work and live in the community on a daily basis and compromise opportunities for future interventions (Brunovskis and Surtees 2010).

Data Collection

When the time comes to collect data, researchers should be prepared to do so in a way that is trauma-informed and culturally sensitive. This section outlines considerations for engaging in ethical data collection beyond ethics committee
requirements, thinking through the practicalities of how and where data collection takes place, informed consent, following through on promises of privacy and confidentiality, and how to leave the field once data collection is complete.

**What does informed consent look like in this context? How can I best avoid overburdening respondents or unintentionally coercing them to participate?**

Researchers are generally required by ethics committees to establish procedures for informed consent among their respondents. This typically includes providing respondents with written information about the study, potential risks for participating, and getting verbal or written consent before collecting any data. Though these formal procedures have a long history and were established to ensure research participants are not coerced into sharing information, their implementation is often minimal at best (Guillemin and Gillam 2004; Sin 2005). Thus, regardless of ethic committee requirements, researchers should carefully consider what consent looks like and the types of incentives being offered, whether explicitly or not. If respondents will have access to medical care through a health-related study but would otherwise not have access to health services, for example, this may unintentionally coerce respondents to participate in a study they feel uncomfortable about, just so they can receive healthcare. In this situation, the study team might consider providing medical care to all potential respondents, regardless of whether they choose to participate in the study (see Reiter 2017).

Ensuring informed consent requires ongoing diligence and should go beyond written or verbal consent given at first meeting. This does not mean assuming respondents are always under distress, do not want to participate if they show emotion, or cannot make their own decision about participating due to traumatization (Zimmerman and Watts 2003; Brunovskis and Surtees 2010). Indeed, traumatized or disadvantaged respondents may want to share their point of view and experiences even when it is emotional or difficult (Newman and Kaloupek 2004; Burgess-Proctor 2015). Rather, it means being mindful about power differentials and paying appropriate attention to what respondents are hoping to get out of their participation (Newton 2017), checking in about any concerns at every meeting, and reminding them they do not have to answer a question if it appears they are hesitant to do so. In some cases it may also be appropriate to remind participants about what you can and cannot provide, so it remains clear you do not have the power, resources, or expertise to help them with their problems.

**How can I best ensure respondents’ privacy and confidentiality?**

Studies about sensitive topics often promise privacy and confidentiality as a way to protect respondents from potential harms. This is usually essential for trafficked persons who may be ostracized or face additional stigma for speaking about their views and experiences. Ethics committees will typically assist with minimal procedures to maintain respondents’ confidentiality, but researchers should take additional precautions to ensure any risk of identification or harmful exposure is properly mitigated. Notions of “privacy” are often a rare commodity in non-Western contexts and may need to be rigorously negotiated.
In terms of safeguarding data, researchers should only promise to do what they can. Be specific with respondents about how data will be safeguarded and protected, but be cautious about promising that their identification will never be known unless research procedures are put into place to ensure this is possible (i.e., absolutely no record of their involvement). If possible, consider not collecting any identifying demographic information and refer to respondents only by their aliases, including in study records (offer participants the opportunity to choose their own). If audio recordings or other records will be used for analysis, researchers should be diligent in backing up, encrypting, and otherwise preventing the theft of their data.

– If conducting research in a community or language other than my own, what steps am I taking to ensure cultural sensitivity and avoid cross-cultural miscommunication?

Whether a topic or research question is sensitive or uncomfortable depends on social and cultural norms, and differences from the study teams’ cultural expectations may not be immediately obvious (Thorburn 2017). Many cultures, for example, discourage open discussion of sex, particularly with strangers. For this reason, it is important to pursue relationships with local hosts, gatekeepers, or research assistants to help recognize potential cultural barriers and how to ethically overcome them. Topics to discuss might include proper dress for the research team and local norms regarding stigma, politics, displays of emotion, individualism/collectivism, age, gender relations, and sexuality.

Finding a professional interpreter or translator who is familiar with the general cultural context is also essential, but it is important to consider how “close” the translator is to the studied population. If the interpreter or translator is too close (e.g., lives in the community), respondents may be concerned about privacy even if the translator is professional and agrees to keep data confidential. If the translator is too culturally distant from the community, they may not understand local cultural or linguistic nuances essential to proper translation. Interpreters and translators should be vetted and interviewed prior to collecting data to ensure they are willing to sign a confidentiality agreement and understand what informed consent and confidentiality mean in practice so they can properly translate these concepts to potential respondents and there is no misunderstanding about what information they need to keep confidential. This is also a good time to see whether they demonstrate professionalism and sensitivity about the study topic, to ensure there are no major conflicts of interest (i.e., they have no stake in the study’s results) and to get a sense of their language fluency in both the researcher’s and the respondents’ languages. If possible, have a backup translator who is already vetted in case one backs out or is unable to work.

To avoid confusion, translation and interpretation should occur in the first person (i.e., direct translation rather than “he said he felt happy because. . .”). It is also a good idea to provide interpreters with a list of instructions or questions the study team will use during interactions with respondents as well as any other uncommon terms that will be used (e.g., human trafficking) ahead of time to ensure they are fully prepared. They should be instructed and reminded to tell the
study team immediately if a respondent suggests they are uncomfortable or no longer want to participate, and once the study begins, debriefings should be scheduled on a regular basis to discuss how things are going and address any cultural or linguistic conundrums.

How does my data collection strategy incorporate a trauma-informed approach? A trauma-informed approach to social research recognizes that respondents who have experienced significant adversity in child- or adulthood may have beliefs, problems, or behaviors that are symptomatic of their experiences, and incorporates safety, trust, collaboration, choice, and empowerment into its methodology (see e.g., Levenson 2017). If interacting with or collecting data from trafficked persons and their communities, study teams can be sensitive to trauma by carefully considering where data collection will take place and who will be present, taking extra steps to preserve anonymity, offering separate confidential crisis counseling, and taking time to build rapport with respondents even if this is costly or inconvenient.

When at all possible, interviews and interactions should occur in a location chosen by the respondent. Use common sense. If respondents were possibly sexually exploited in hotel rooms, conducting interviews at a hotel should not be a viable option. Whereas some participants may want to meet at home or in a public location, others might be worried about their family or neighbors hearing or seeing them. Others might be concerned about inability to travel to a meeting place due to lack of money, time, work, the distance involved, or lack of childcare. If respondents seem unsure, provide them with multiple options and, if possible, offer solutions to their concerns (e.g., paying for their transportation).

Building trust tends to take time, but feel free to ask what would make participation more comfortable. If respondents fear being misunderstood or misquoted, offer to send them a recording of the interview or conversation. To facilitate openness, comfort, and a sense of safety, Thorburn (2017) recommends three strategies: allowing participants to pace the interview by letting them be in control over what order to go in and how much time to spend on different questions, incorporating nonjudgmental questioning by not assuming whether the respondent experienced something positively or negatively, and maintaining a therapeutic presence by reflecting back emotions, validating experiences, and challenging narratives of self-blame.

Finally, researchers should consider whether all of their questions are necessary and in whose interest they are being asked. If questions in a study are intrusive, does the aim of the study warrant this and why? When questions are being asked merely out of personal curiosity rather than empirical analysis, they should be omitted.

What is my plan for leaving the field? Just as important as negotiating access to the field is planning for how to exit (Sloan and Wright 2015; Delamont 2016; Thorburn 2017). This is particularly important for ethnographic or ongoing studies where researchers have spent regular time in the field or have asked their respondents about sensitive topics (Reeves 2010). At the very least, it is important to execute an exit plan that includes
informing respondents, gatekeepers, and others that the study is complete (UNIAP 2008). In some circumstances this may not seem necessary, but researchers should give considerable thought to whether respondents have gotten used to their presence or have expectations of additional contact. Researchers should also consider whether they want to provide their contact information to respondents, whether they want to maintain contact with them after the study is over, and how they will respond if respondents contact them unexpectedly or are in need of assistance. Whatever the researcher decides, they should communicate this and follow through on any promises.

**Representation**

This final section outlines questions about representing and disseminating research once data collection is finished, including how the researcher plans to share findings with participants and how their conclusions might impact those affected by trafficking policy more broadly.

- **How and when do I plan to share my findings with respondents, if at all?**
  Early in the research planning process, it is important to carefully evaluate if, how, and when findings will be shared with the individuals, communities, and gatekeepers who contributed. Whereas some researchers are adamant that participants should have the opportunity to provide feedback on findings before they are published, others insist this puts an unnecessary burden on the respondent and/or compromises a study’s validity (see Cooper 2008; Aldridge 2017). Considering that many trafficked persons have little power or status to challenge research findings and few opportunities to express their views, it is important to consider both the benefits and challenges of seeking respondent feedback, as well as potential consequences. Either way, it is important to make a steadfast decision about this early on because though it may be easy to make promises on the field, researchers may regret this later on and/or fail to follow through.

  If not shared prior to publication, researchers should strongly consider making plans to make the completed study accessible, at the very least, to those who participated. In doing so, they should be mindful of how their depiction of respondents and stated conclusions will be received and how they might handle negative feedback from participants who are unhappy, frustrated, or disappointed about how they were portrayed. This can be a difficult and uncomfortable process but should not be left unaddressed, particularly with individuals with whom there is a significant power differential. If there is concern about legibility of the study or that respondents might misunderstand its conclusions, the researcher can consider providing the final product along with a presentation or workshop geared specifically to their respondent audience.

- **How might my findings impact those affected by trafficking policy?**
  Usually, researchers do not have complete control over how their findings are interpreted by government agencies, political institutions, mass media, or civil
society. Nonetheless, given that trafficking is often sensationalized in the media and trafficking research could benefit from more empirical- and evidence-based evaluation, researchers must give early and careful consideration to how their findings might impact disadvantaged populations and those affected by trafficking policy more broadly. How questions are asked, the types of questions asked, tone of writing, how quotes are interpreted, how trafficked persons are portrayed, and how the media depicts a study’s conclusions all have the potential to contribute to society’s underlying understandings of the trafficking experience, trafficked persons, sexually exploited persons, and migrants in general, which ultimately impacts the well-being of these populations (e.g., see Cwikel and Hoban 2005, Coutin and Vogel 2016). This does not mean always representing respondents and disadvantaged populations in a positive light or in allegiance with the researcher’s own political views. Rather, it means giving considerable thought to how research subjects are being represented in the study, whether depictions are representative of all or only a few respondents, and whether findings are situated within wider contexts of social inequality beyond respondents’ individual situations (see Seal 2017).

**Conclusion**

An ethical approach to trafficking research includes giving considerable thought to how a study is designed, how to appropriately negotiate access to respondents, being honest about how the researcher’s position and emotional reactions on the field will impact findings, and being diligent about recognizing ethical conundrums as they arise. Whereas much of the general guidance on ethics in research is focused on how it is undertaken during the data collection stage, it is important researchers also consider ethical questions related to gaining access, leaving the field, the extent to which they can truthfully generalize their respondents’ experiences, and the implications of how findings are presented, both for those who participated in the study directly and for those affected by counter-trafficking policy, practice, media coverage, and public opinion more broadly.

Abstract
There has been little examination of sex trafficking as a form of non-state torture in the anti-trafficking field. Furthermore, very few scholarly treatises acknowledge the overlap between these two phenomena, let alone assess these connections in depth. As a result, trafficking survivors sometimes receive suboptimal care. In many cases of sex trafficking, the psychological and physiological abuses that survivors of human trafficking endure can fall within the clinical spectrum of non-state torture trauma. This chapter will discuss the intersection of trafficking and torture and highlight the psychological and physical constellation of symptoms that reveal trafficking as an identifiable form of torture trauma. It will argue that strengthening the awareness of the connection between trafficking and torture trauma will increase the diagnostic accuracy of mental health profiles in survivors of trafficking and improve the profiles’ utility in shaping appropriate care. This awareness will also help establish a universal standard of care for survivors.
of trafficking that includes recognized methods for the treatment of torture trauma. A universal standard of care increases empathy and understanding for survivors’ psychological states and helps care providers recognize the ways that survivors’ complex behaviors are shaped by traumatic stress. This acknowledgment increases diagnostic clarity and disrupts victim-blaming perceptions that could otherwise impair the judgment of personnel who provide support in a multidisciplinary team context, such as clinicians, social workers, law enforcers, and legal professionals. This acknowledgment can also empower supporting professionals such as clinicians, case managers, community advocates, and social workers to create more complete clinical profiles for survivors, devise more effective treatment protocols, and improve the prospects for effective legal reparation for survivors.

**International Human Rights Law Regarding Torture**

Increasingly, practitioners who work with victims and survivors of human trafficking are recognizing that the level of psychological and physical abuse found to have been inflicted upon survivors may qualify as non-state torture. This recognition reflects the fact that the legal definition of torture in human rights law differs from the term’s usage in the media and from its interpretation in the general public’s understanding. The definition of torture under human rights law, in one of the United Nations’ proclamations regarding its Convention Against Torture and other Cruel, Inhuman or Degrading Treatment or Punishment (UNCAT 1984), is broken down into several key elements: (a) the nature of the act; (b) the intention of the perpetrator; (c) the involvement of state, public, or government officials; and (d) severe infliction of mental or physical pain or suffering. The definition of torture from the UNCAT year is as follows:

For the purposes of this Convention, the term “torture” means any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in or incidental to lawful sanctions. (UNCAT 1984)

Accordingly, this definition refers to the involvement of a public official or someone of an official capacity in inflicting severe, intentional physical or mental
pain or suffering for the purposes of achieving a specific result from the victim, such as obtaining a confession, delivering punishment, enforcing power and compliance, or creating intimidation and fear, to name a few such intentions (APT 2014). The UNCAT definition holds that torture, when conducted by a private individual, cannot be condoned unless there is the involvement of a public or governmental official (APT 2014; OSCE 2013). However, the Committee Against Torture (CAT), which monitors the implementation of the UNCAT, further clarified that where private individuals inflict torture, if the state fails to intercept, disrupt, or take appropriate actions to prevent such acts of torture or to prosecute private individuals for committing such an act, this, means that the state is complicit in the torture. The committee highlighted this aspect of its mandate specifically in reference to any state’s recognized failure to prevent domestic violence, rape, genital mutilation, human trafficking, and gender-based violence (CAT General Comment No. 2, §18 2008). Globally, legislation is shifting in the direction of recognizing that gender-based violence should be included in the topic of torture, and countries such as Argentina, Brazil, and Uganda have incorporated legislation condemning acts of torture committed by private individuals. Failure on the part of a state in preventing such acts also enhances the potential of this type of danger continuing, as well as communicating to perpetrators that they can operate with impunity (see ▶ Chap. 28, “Sex Trafficking as Structural Gender-Based Violence: Overview and Trauma Implications”)

However, the international community acknowledges the differences between torture that is perpetrated outside of the traditional definition of torture and that which is imposed upon political prisoners or detainees in custody of a state, and CAT seeks to broaden the overall definition of torture (Edwards 2006; McGregor 2014; OSCE 2013). Aside from this consideration, the traditional definition of torture as discussed above has received vast criticism and has been considered, in regard to women victims, to be minimizing, marginalizing, and lacking in gender sensitivity (Edwards 2006). This criticism has prompted feminist scholars such as Edwards (2006) to call for a “feminization” of the definition of torture and to do so mindfully, so as not to hyper-focus on the sex/gender of a victim, as that may be just one of many factors present in a situation involving torture (Edwards 2006). These scholars enjoin leaders and policy makers to balance their consideration of all factors and to create case-by-case considerations in examining the criminality of cases of torture, since torture is unique and complex and occurs in a multitude of diverse situations (Edwards 2006; McGregor 2014). From the definition’s lack of gender-neutral language – exemplified in phrasing such as the use of the word “him” in referencing the victim in the definition of torture – the current definition excluded an array of human rights violations inflicted upon women and children in non-state situations. Many such victims of those violations bear the deep physical and psychological scars of torture such as their subjection to human trafficking itself, gender-based violence, rape, honor killings, female genital mutilation, forced abortions, violence against pregnant women, reproductive coercion, domestic
violence, and stoning, to name a few of the horrors suffered and to reflect the importance of broadening the definition for inclusion of these many complex manifestations of torture (Edwards 2006; McGregor 2014; OSCE 2013; Kalra and Bhugra 2013). The CAT reports indicate in that regard that torture and other forms of ill treatment can happen in a variety of contexts that range from inpatient residential institutions to medical institutions, as well as educational institutions (Ingelse and United Nations 2001), to name a few (APT and Center for Justice and International Law 2008).

The Nexus of Human Trafficking and Torture: Tactics of Coercion, Abuse, and Torture Used by Traffickers

The methodologies, dehumanization process, and undue influence tactics of traffickers who exert manipulative and/or coercive power and control over a victim parallel and mirror the behavioral patterns of the torturer. The aims of both are systematically to shatter and break down the victims’ cohesive sense of self, continuity, and worldview and to create a fragmentation of identity in their victims. Through their self-instituted power and use of psychological and physical torture in their grooming and reinforcement processes, traffickers seek to create and enforce powerlessness and helplessness that result in concomitant elements of compliance and control within the victims they exploit for profit. This is one of the key elements of coercion.

Psychologist Alfred Biderman’s work on coercive methods for eliciting individual compliance (1957), in which he documented and researched tactics of psychological torture and coercion used to obtain forced confessions of US Airforce airmen who were prisoners of war during the Korean War, powerfully parallel the tactics used by traffickers. Biderman outlines general methods utilized by torturers, as demonstrated in the chart below. The first three rows come from his original work, to which the author adds a fourth column, “Traffickers’ Tactics,” to demonstrate the similarities of methods of the torturer used by the trafficker. The examples listed in the “Traffickers’ Tactics” category are not an exhaustive list but demonstrate a few of many parallels. These methods may be used by one or more traffickers to one or more victims at the same time. Of the eight methods outlined by Biderman, most are interdependent and reinforced by other methods listed as follows.
### Bidderman’s Chart of Coercive Methods – Supplemented with Trafficker

<table>
<thead>
<tr>
<th>General Method</th>
<th>Effects (Purpose)</th>
<th>Variants</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Isolation</td>
<td>• Deprives victim of all social support of his ability to resist</td>
<td>Complete solitary confinement, Complete isolation, Semi-isolation, Group isolation</td>
</tr>
<tr>
<td></td>
<td>• Develops an intense concern with self</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Makes victim dependent on interrogator</td>
<td></td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>By isolating victim from friends and family, trafficker can eliminate agendas that may compete with that of the trafficker. This initially may be done in several ways and is not limited to physical environment, such as living situation or work setting, psychologically, through attacking self-esteem, self-worth, and creating polarization of worldview; or initially, through a fraudulent financial relationship, friendship, or job.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Trafficker may use economic abuse of power through control of finances to create dependency on trafficker, or through withholding money or providing little to no pay for victim. • Through isolation, trafficker can begin to reshape victim’s perceptions and reactions to abuse inflicted by trafficker, further normalizing the experience of interpersonal violence.</td>
<td></td>
</tr>
<tr>
<td>2. Manipulation of perception</td>
<td>• Fixes attention upon immediate predicament; fosters introspection</td>
<td>Physical isolation, Darkness or bright light, Baren environment, Restricted movement, Monotonous food</td>
</tr>
<tr>
<td></td>
<td>• Eliminate stimuli competing with those controlled by captor</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Frustrates all actions not consistent with compliance</td>
<td></td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>Trafficker shames and blames victim for abuse that victim is experiencing as well as any negative circumstances occurring in victim’s life. This often creates shame, depression, anxiety, and emotional isolation for the victim.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Through isolation, traffickers can control a victim’s perceptions and emotions which can shape and induce compliance to align with trafficker’s motives of exploitation, power, control, and profit. • Traffickers attempt to create dependency on them, through control of finances, or situations that align with the trafficker’s agenda.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Through control of food intake, victim is unable to eat due to fear of negative consequences.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Traffickers may completely eliminate and/or control food intake for psychological conditioning and/or control of victim. Demands and criticizes victim’s body image to erode self-esteem. Restricts food intake as a form of punishment.</td>
<td></td>
</tr>
<tr>
<td>3. Induced debilitation; exhaustion</td>
<td>• Weakens mental and physical ability to resist</td>
<td>Semi-starvation, Exposure, Exploitation of wounds; Induced Illness; Sleep deprivation, Prolonged constriction, Prolonged interrogation of forced writing, Over-exertion</td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>Requires victim to meet high quotas or unrealistic demands of tasks or duties, by which victim must work for extensive hours or days.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Through isolation, traffickers can control a victim’s perceptions and emotions which can shape and induce compliance to align with trafficker’s motives of exploitation, power, control, and profit.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Requires victim to work extensive number of hours with little to no pay, regardless of illness or physical ailments. • Traffickers may completely eliminate and/or control food intake for psychological conditioning and/or control of victim.</td>
<td></td>
</tr>
<tr>
<td>4. Threats</td>
<td>• Cultivate anxiety and despair</td>
<td>Threats of death, Threats of non-repatriation, Threats of endless isolation and interrogation, Threats of violence, Threats against family, Mysterious changes of treatment</td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>Makes threats of violence to victim, victim’s loved ones, friends, or peers if specific quotas, actions or duties are not completed in accordance with rules set by traffickers.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Threats may be intermittent and inconsistent to heighten hyperarousal, confusion, fear, and compliance within victim.</td>
<td></td>
</tr>
<tr>
<td>5. Occasional indulgence</td>
<td>• Provides positive motivation for compliance</td>
<td>Occasional favors, Fluctuation of interrogations, promises, Reward for partial compliance, Prolonging starvation</td>
</tr>
<tr>
<td></td>
<td>• Hinders adjustment to deprivation</td>
<td></td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>After severe beating or bouts of violence, shows an act of kindness towards victim, which can strengthen/reinforce a victim’s traumatic bond to the trafficker. Traffickers must do this consistently and intermittently to keep victim in a state of hyperarousal and confusion.</td>
<td></td>
</tr>
<tr>
<td>6. Demonstrating omnipotence and Omnipresence</td>
<td>• Suggests futility of resistance</td>
<td>Confrontations, Pretending cooperation takes for granted, demonstrating complete control over victim’s life</td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>• Traffickers claim to be watching victim at all times and will find out if anything is ever done behind trafficker’s “back”. • Traffickers may be working with corrupt government officials, in which victim has seen or has been purchased by, for example, police, therefore reinforcing the message to the victim that they cannot ever leave or defy trafficker’s orders, as traffickers works with the authorities.</td>
<td></td>
</tr>
<tr>
<td>7. Degradation</td>
<td>• Makes costs of resistance appear more damaging to self-esteem than captivity</td>
<td>Personal hygiene prevented, Filthy infestations, Surroundings, Demanding punishments, Insults and taunts, Dental neglect</td>
</tr>
<tr>
<td></td>
<td>• Reduces prisoner to animal level conditions</td>
<td></td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>Puts the victim in compromising situations, such as revenge-style pornography, filming it, and threatening to send it to loved ones. •贝hesting, humiliating, spoiling on, verbally and physically assaulting, victim in front of others.</td>
<td></td>
</tr>
<tr>
<td>8. Enforcing trivial demands</td>
<td>• Develops habit of compliance</td>
<td>Forced writing, Enforcement of minute rules</td>
</tr>
<tr>
<td>Traffickers Tactics:</td>
<td>Inflicts severe beating or physical violence as a result of something minor or trivial and/or lack of compliance with unreasonable rules.</td>
<td></td>
</tr>

Symptomology of Trafficking and Torture Observed in Its Victims

Victims of trafficking experience non-state torture that ranges in kind from sexual, physical, and psychological violence to a combination of all of those inflictions. Populations documented to have experienced the impact of trafficking and torture trauma range widely from refugees of war trauma who are sexually exploited in forced migration settings to survivors of commercial sexual exploitation and forced labor, both domestically and internationally. Additionally, those experiencing gender-based violence – among other forms of abuse – are similar to survivors of torture, as trafficked persons come from every walk of life and do not present with a specific profile. In subsequent entries herein, an overview of symptoms documented in this author’s clinical research, findings, and direct work with victims of torture and trafficking as well as with scholarly research and findings by global experts will be discussed and highlighted. This is by no means an exhaustive list but an overview of the many traumas that can impede a survivor’s day-to-day functioning and ability to effectively cope, heal, and societally reintegrate.

Victims of trafficking, in ways similar to that of victims of torture in reported studies (Hemmings et al. 2016), have been documented having to endure consistent and intense levels of physical violence. Many of the physically violent tactics of traffickers as referenced in the chart above are intended to create fear and enforce compliance. Trafficked persons also report experiencing an immense amount of violence from the buyers. Both perpetrators (buyer and trafficker) are responsible for the range of abuse and trauma. Trafficking victims experience an array of physical stressors and psychological violence, methods to induce humiliation, hopelessness, and helplessness.

Some but not all of the experiences reported by victims of trafficking and torture include the following:

- Physical stressors, such as traumatic brain injury from having their heads slammed against various objects, branding, scarification, tattooing, and burns (OSCE 2013)
- Contusions or lacerations due to blunt force trauma such as being beaten with a rod or baseball bat, sharp force injuries such as stab wounds and cuts, mutilation to sensitive body parts such as the genitals, dental injuries such as extraction of teeth, and maxillofacial damage from blows to the facial area
- Being raped, infliction of STIs as a result of sexual violence, tearing of the anus due to anal rape, manual strangulation or ligature strangulation (Funk and Schuppel 2003), suffocation, and asphyxiation
- Restricted movement and/or placing of a victim in a stressful position for a long period of time, such as being bound or locked in a small space for extended periods
- Being subjected to mock executions, removal of body parts such as fingers or toes, as well as sensitive body parts such as the kidneys and vital organs
- Threat of death to self and loved ones and witnessing torture and abuse of others
• Reproductive injuries, such as forced abortions and/or complications from prior abortions that were inadequately performed (Cooper et al. 2009), and nerve injuries resulting in chronic pain and other complications.

Also, research has examined the need for comprehensive protocols and assessment of the potential development of cancer as a consequence of human trafficking. Due to multifactorial issues from violence related injuries, adverse childhood experiences, genital and dental injuries to exposure to noxious and or narcotic substances (Moynihan and Olive 2014). It is important to note that the physical signs of torture may not always be present on the body of a survivor, as many survivors may have experienced years of beating, violence, and blows to the body that did not penetrate the skin or left bruises that healed, instead of permanent scars. If this is the case, it does not make the extent of torture the survivor experienced any less severe, nor does it indicate that torture was not present in their experience (United Nations 1999).

Trafficking survivors express a range of mental health sequelae as a result of the physical torture and violent coercive methodologies inflicted by traffickers. Survivors of trafficking experience cognitive, emotional, relational, as well as neurobiological adverse effects as a result of the trauma during the trafficking. Some survivors exhibit complex trauma-type symptoms as a result of the consistent trauma and abuse they have experienced during the trafficking. Pioneering traumatologist Judith Herman (2015) proposed a new diagnosis, complex trauma, to fully capture the severity and psychological harm of prolonged, repeated trauma that victims of trafficking or torture, war refugees, genocide survivors, survivors of ethnic cleansing, victims of combat trauma, prisoners of war, and long-term victims of domestic violence and child abuse experience. Complex trauma is classified as a chronic experience of interpersonal trauma that is premeditated and inflicted or caused by other humans and in which the victim experiences prolonged and repeated severe abuse.

Further understanding of trauma can be a powerful and honoring lens to respect the interpersonal experience of survivors of trafficking and protective behaviors that may be judged as “uncooperative” or “difficult.” It is imperative that all practitioners working with survivors of trafficking be familiar with symptoms of trauma, specifically complex trauma.

Traumatologist Christine Courtois (2008) made the following observations based on her extensive work in the area of complex post-traumatic stress disorder (CPTSD) which appears in the following domains that can further illuminate the experience and behaviors of survivors of trafficking and torture:

1. Difficulty with emotional regulation, from suicidal ideation and thoughts of self-harm, suppressed or explosive anger, feelings of chronic depression and sadness, impulsivity, and difficulty communicating feelings and needs.

2. Alteration of consciousness, such as reliving or dissociating from traumatic events, impaired auditory/visual/perceptual and memory-related functions, and fluctuation of mood from numbness to hypersensitivity and feeling overwhelmed.
3. Alterations of self-perception, in which the survivor believes and feels estranged, different, and disconnected from other human beings and experiences an immense amount of shame, helplessness, guilt, and belief that they are permanently damaged by the trauma.

4. Distorted perception of the perpetrator, in which they attribute complete power to the perpetrator and are heavily preoccupied with the relationship to the perpetrator, whether through thoughts of revenge or internalization of the perpetrator’s beliefs.

5. An alteration in relationships and connections with people, such as difficulty in entrusting people as advocates or resources, possibly leading to self-isolation, feeling unable to trust the motives and intentions of people, and inability to discern that other people can be caring and not harmful.

7. Alterations in their system of meaning, such as despair and hopelessness in connecting or finding individuals that honor and understand the scope of the experiences they have suffered.

Expression of traumatic symptoms may be culturally bound or cross culturally expressed, and the categories of complex PTSD are a guiding framework that may present differently in every survivor that practitioners engage. A general competency and understanding of trauma and how it presents and affects your domain of protection or advocacy as a practitioner should be a requirement and standard for working with trafficked persons. It is also incredibly important to be mindful of pathologizing survivors of trafficking as only traumatized and not acknowledging or engaging their resiliency and strengths.

**Optimizing Care for Victims of Trafficking: Utilizing Field-Based Standards and Guiding Principles**

Currently, there is a lack of continuity and consensus on how recovered victims of trafficking are cared for, and practitioners do not currently operate from a universal or standardized model of care. Promising practices may be understood through trainings and regional awareness campaigns; however, these are only selectively and inconsistently applied to various victim situations. There is a serious lack of thorough, consistent, culturally sound, multidisciplinary engagement, treatment, and long-term support for survivors of trafficking in psychological, medical, judicial, and legal systems, as well as research tools and indicators that use empirical evidence and validated screening tools to evaluate the effectiveness of psychological interventions used with survivors (Hemmings et al. 2016) (see Chap. 41, “Health and Social Service-Based Human Trafficking Response Models”).

It is recommended that a comprehensive medical, clinical, legal framework that includes guiding principles and standards for medical, psychological, and legal systems be established for survivors of trafficking akin to the work that has been accomplished for survivors of torture. Such a framework could provide guidelines.
for mental health, medical examination/documentation, legal treatment, and legislative standards related to survivors of torture. This can be a promising standard to norm the care for survivors of trafficking, given the level of skill, trauma knowledge, and sensitivity especially needed in the medical and clinical care for survivors of torture. The establishment of an international working group to highlight the understanding that trafficking is a form of torture could utilize, yet tailor, specific components that address situationally specific needs of survivors of trafficking to create consensus for universal standards of care and intervention.

The Istanbul Protocol: Manual on the Effective Investigation and Documentation of Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment is a United Nations document that establishes standards and specific guidelines on conducting effective legal and medical documentation and investigations into torture and ill treatment. This can be an excellent guiding framework for capturing the clinical and medical-legal needs and scope of documentation needed for victims of trafficking. The document encourages multidisciplinary, culturally intelligent collaboration in a trauma-focused way to reduce the traumatization to survivors of torture. It helps guide the practitioner to capture a thorough overview of survivor’s experiences, medical and mental health histories, current presenting symptoms and medical and clinical complications, guidelines for processes and procedures of a medical exam, legal interview, psychological/neuropsychological evaluations, clinical case formulation, ethics, and many more important domains needed for consideration in articulating a comprehensive and actionable multidisciplinary plan for the legal protection and medical and mental health needs of survivors of trafficking. Utilizing torture trauma as a framework can greatly enhance the clinical treatment that is provided to victims and support not only a clinical profile but trauma-sensitive engagement. When a solid clinical narrative and trauma framework is established and additionally the lens of torture trauma is applied, it can be instrumental in helping practitioners navigate the complex reactions, behaviors, and needs more effectively. This can enable a greater experience of healing and restoration for the victim as well while helping practitioners to understand the effects and processes and procedures needed to augment their work in the protection, intervention, and stabilization of survivors of trafficking. Moreover, it may disrupt commonplace victim blaming, in which behaviors of survivors are not understood due to the lack of understanding of trauma and situationally specific indicators related to trafficking.

Numerous resources exist to further address the key foundational issues that are greatly lacking in the anti-trafficking field. These include global working groups, publications and comprehensive reports addressing needs of victims on aftercare, practitioner training, recommendations for judicial changes and adoption of counter trafficking legislation, and continued training and funding for law enforcement to combat trafficking in persons. Yet one of the key components, which is the success and restoration of victims by providing safe and specialized housing, is lacking. There exists a very small number of safe houses or aftercare facilities for the healing and restoration of victims of trafficking. No current research or inventories of shelters were found for 2018 in the United States; most reviews were conducted in 2012 and 2013. However, the alarming numbers of 2012 alone speak to the
current situation in the counter-trafficking field today. In 2012, the Polaris project conducted a national survey of anti-trafficking organizations providing shelter specifically designated for survivors of human trafficking and approximated that there were approximately 529 beds in agencies throughout the entire United States. In California, Orange County opened its first ever emergency shelter for victims of sex trafficking in August of 2018. Various states and countries have conducted surveys assessing the service providers and system response to trafficking. A report from the state of Virginia in 2012, based on a needs assessment survey of services available for victims of human trafficking, found that none of the responding agencies and/or programs had formal procedures and protocols in place to guide them on how to serve victims of trafficking. These numbers provide a snapshot of the continuing issues currently plaguing the anti-trafficking field and are indicative of the need for consensus among counter-trafficking practitioners on comprehensive standards of care for survivors of trafficking. Utilizing the framework of torture trauma, practitioners can begin to remediate and manage many of the issues and key gaps currently impeding the anti-trafficking movement in the domains of psychological treatment, legal advocacy, medical care, judicial procedures, and societal perceptions.

Abstract
This chapter addresses the concept of slavery, exploring its character and significance as a dark page in history, but also as a specifically criminological and zemiological problem, in the context of international law and human rights. By tracing the ambiguities of slavery in international law and international development, the harms associated with slavery are considered. Harms include both those statutorily proscribed and those that are not, but that can still be regarded as socially destructive. Traditionally, anti-slavery has been considered within the
parameters of abolition and criminalization. In this context, recently, anti-trafficking has emerged as a key issue in contemporary anti-slavery work. While valuable, anti-trafficking is shown to have significant limitations. It advances criminalization and stigmatization of the most vulnerable and further perpetuates harm. At the same time, it identifies structural conditions like poverty, vulnerability, and “unfreedom” of movement only to put them aside. Linked to exploitation, violence, and zemia, this chapter brings to the fore some crucial questions concerning the prospects of systemic theory in the investigation of slavery that highlight the root causes of slavery, primarily poverty and inequality. Therefore, the chapter counterposes an alternative approach in which the orienting target is not abolition of slavery but advancing structural changes against social harm.

Introduction

A common understanding of slavery defines slavery as the practice or system of “simply” owning slaves. This is often implied to mean that slavery is either a form of ownership over people or a form of exploitation over the conditions one works. Although, both these claims fail to fully grasp slavery, the language of slavery figures increasingly often in Western modern judicial reasoning, academic analysis, and media discourse. The underpinnings of slavery often relate to either crime or harm.

When considered through the lens of criminalization and crime, slavery was abolished internationally with the Anti-Slavery Convention 1926. Since the 1990s, however, slavery has been redefined through references to human trafficking. Conversely, trafficking is mentioned in contemporary rules on slavery (Gallagher 2010). For instance, references to slavery are included in Article 3 of the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children supplementing the United Nations Convention against Transnational Organized Crime (Palermo Protocol 2000), and, vice versa, trafficking contributes to the definition of enslavement in Article 7(2)(c) of the Rome Statute of the International Criminal Court (ICC Statute) (November 15, 2000, GA Res. 55/25, Annex II, UNGAOR, 55th Sess., UN Doc. A/45/49 (Vol. I) (2001), entered into force Dec. 25, 2003; The Rome Statute of the International Criminal Court, 2187 UNTS 90, July 17, 1998, entered into force July 1, 2002). This ambivalent connection between slavery and trafficking has been diffused in national legislations and globally propagated as a particularly “heinous” type of crime (see, e.g., The Voice Of America 2017).

Yet, an understanding of slavery through the lens of harm allows us to go beyond the binary concept of criminal versus noncriminal acts and extends beyond strictly legal definitions. For the proponents of this approach, it makes little sense to address slavery by utilizing criminalization and crime control approaches while leaving intact a wide range of physical, economic, social, psychological, and cultural conditions that underpin human detriment and suffering. This is because crime control strategies may exacerbate harms without resolving the underlying social,
cultural, and economic conditions that perpetuate inequality and crime (Webber 2004; Tombs 2018; Hillyard and Tombs 2004). Though the term is often omitted, this approach is attuned to zemiology with social harm at its core.

Originating from the Ancient Greek word *zemia*, zemiology carries numerous connotations. Existing literature defines zemiology as the “study of harm” (Hillyard and Tombs 2004), while zemia also denotes, among other things, the study of loss or damage and injury as well as the study of various forms of punishment, when deviant and/or legal transgressions occur (Boukli and Kotzé 2018: 2–3). Critical scholars have therefore utilized zemiology to talk about structural violence, systemic conditions, and social injury. For them, capital accumulation depends on labor exploitation, made possible by the inequalities that arise from social divisions in their classist, racist, sexist, and ableist manifestations (see Fraser 2003; Fraser and Gordon 1994). The typical example of the subject of capitalism, for instance, is the rational utility maximizer who is free from social and natural restraints or external interferences and who “is sleepless, tireless, hyper-able, flexible and mobile, continuously enhancing one’s capacity to produce and consume” (Mladenov 2016: 1232). In turn, while capitalist exploitation and structural harms are the “inevitable consequence” of laissez-faire capitalism (Pemberton 2015), the typical focus of crime control agencies is on interpersonal violence and on individual responsibility. Against the grain of this normative position, zemiologists highlight the limitations of using criminalization as a means of addressing harms and shed light on exploitative structural features of capitalism. Applying this to slavery, the zemiological lens opens up the possibility of dealing with slavery, exploitation, and suffering as harms, conflicts, and injuries deserving mediation, arbitration, and structural remedies, rather than a mere crime control fix.

The twenty-first century has seen re-energized anti-slavery actions, and this development is also reflected in academic discussion of slavery. Slavery, using broad brushstrokes, has been described in four ways: firstly, as direct violation of international anti-slavery laws and directly linked to ownership and to chattel slavery (see Gallagher 2010; Chap. 3, “Concepts of Slavery in the United States 1865–1914”); secondly, as modern slavery and a direct violation of international anti-trafficking laws linked to transnational human trafficking and organized crime (see Segrave et al. 2009); thirdly, as “modern slavery” or “modern-day slavery” that marks the rise of contemporary abolition; finally, as an alarming attempt to depoliticize issues such as imperialism (see Kempadoo 2016), racism, and sexism, through sweeping measures that aim to criminalize migration and sex work (see Bernstein 2010). To this fourth point, critics have added that contemporary efforts to use the emotive term “modern slavery” rely on “rebranding human trafficking” using the less “legalistic” concept of modern slavery (Dottridge 2017; Beutin 2017). Ultimately, slavery is being directly linked to ownership, and using the terms modern slavery, slavery, as well as human trafficking interchangeably has stirred much controversy.

This chapter highlights the uneasy relationship between slavery and human trafficking within international law and international development from a zemiological standpoint. Following Julia O’Connell Davidson (2015), the analysis
shows that both international law and international development institutions inevitably take approaches that blur, rather than clarify, the lines between slavery and human trafficking. In doing so, anti-trafficking and anti-slavery have formed a united front pursuing anti-immigration policies and border control measures cracking down on “illegal migration” in order to arguably protect trafficking/modern slavery survivors. There is much discussion of inequality, injustice, discrimination, exclusion, poverty, and abuse in the context of this topic (see, e.g., European Commission n.d.; Anti-Slavery Commissioner 2016). There is also a great deal of talk about victims and survivors of slavery and/or human trafficking, vulnerable groups, marginalized communities, victims of special interest, and disempowered populations. However, this discourse is silent when it comes to the beneficiaries of increasing inequality, injustice, and suffering on a global scale. It merely recognizes victims and perpetrators of particular crimes but remains visionless when confronted with the systemic matrix of human exploitation, a reality that sustains a world increasingly saturated with inequality and injustice. That just 1% of the global population owns more wealth than the other 99% is much more than a slogan (Hardoon 2017).

The entry point toward investigating the above contradiction takes a genealogical perspective focused on discourses of slavery. Exploring the uneasy relationship of slavery and human trafficking in institutional discourse offers new insights into contemporary crimes and harms. By turning to international law and international development, the liminality and ruptures of slavery and trafficking are being considered in decisions of the European Court of Human Rights (ECtHR) and in the Sustainable Development Goals (SDGs) of the United Nations Development Goals. The concluding section suggests an alternative approach, the main target of which is advancing structural change against harm. This builds on several themes addressed in this Handbook (see ▶ Chaps. 4, “When Freeing the Slaves Was Illegal: “Reverse-Trafficking” and the Unholy, Unruly Rule of Law”, ▶ 9, “The Nebulous Definition of Slavery: Legal Versus Sociological Definitions of Slavery” and ▶ 79, “European Court of Human Rights and the Right Not to Be Subjected to Slavery, Servitude, Forced Labor, and Human Trafficking”) and adds a comprehensive evaluation of the multiple harms involved without having to make a choice as to which harm is greater. Importantly, it means we do not need to choose between those harms we recognize and those we challenge but can instead think about different ways of addressing multiple harms, beyond recourse to criminalization and border control.

Genealogy

Genealogy can take various different meanings. In its history, “genealogy” is etymologically linked to the Greek word geneālogia, which stands for tracing descent and is indicative of tracing connections. For instance, in the everyday usage of the word, a genealogical tree charts the relationships and descent of an individual, their genes, and familial or group connections. Methodologically, family historians and genealogists have investigated past evidence in order to chart genealogical trees (see, e.g., Osborn 2017). By deploying systematic efforts including
searches in online catalogues, archives, collections, and databases, records emerge and are then carefully pieced together to gradually unearth family histories.

Influenced by this attachment to *genealogía*, in ethnography, the genealogical method is a procedure initiated by late nineteenth and early twentieth century ethnographers to identify social connections and lines of kinship. For instance, W.H.R. Rivers (1910) used genealogy to enhance the analysis of social organization by collecting systems of relationship and kinship through oral accounts of pedigrees. This method of collating oral accounts of pedigrees came to furnish the basis of the method, which was often used to discern a family tree from its mythical attendants. For contemporary ethnographers, however, the combination of genealogy and ethnography moves away from excavation work and deprivileges the supposed linear evolution of history as well as the idea that our past is broken down in small puzzle pieces. By extension, it also opposes the idea that as genealogists, we may be tasked to join these pieces back together. To the contrary, contemporary genealogy is oriented around disruptions, discontinuity, and critique (Mahon 1997), with a focus on bodies and their discursive reproductions. For instance, instead of piecing together the scientific knowledges about slavery and modern slavery, genealogy adopts a more nuanced approach: it reveals the contingent historical conditions of the expansion of immigration detention that make it possible to use anti-trafficking laws to obstruct humanitarian work (see Townsend 2017).

In critical theory, the genealogical approach has been used to confront ideas or practices that present themselves as universal and natural. This function of genealogy is closely linked to critique. Originating in the first generation of the Frankfurt School with critical theorists like Max Horkheimer (1895–1973), Theodor Adorno (1903–1969), and Herbert Marcuse (1898–1979), genealogy is an attempt to recognize that things, values, and events are constituted historically, discursively, and practically. Where critique is seen as an assessment of the current state of affairs, it is also linked to an examination of what is to be done to reach a desired state. In practical terms, it involves the use of dialectic, reason, and ethics as means to study the conditions under which people live (Budd 2008). In the field of epistemology, also grounded in critique, genealogy has come to be used as an investigative method, which offers an intrinsic critique of the present. Particularly in the works of Friedrich Nietzsche and Michel Foucault, genealogy provides the tools for uncovering the relationship between knowledge, power, and formation of subjectivities. For example, Foucault would ask, what type of citizens are being created by anti-immigration policies.

The genealogies of Nietzsche and Foucault assume that society is composed of contesting forces. Nietzsche refers to these contesting forces as will to power. Some of these forces represent an affirmative will to power while others a nihilistic will to power (Nietzsche 1967). Similarly, Foucault refers to these contesting social forces as power. This power is not necessarily the coercive sorts of laws that prohibit certain acts but a more constructive power – in that it constructs objects, subjects, and knowledge. For instance, Foucault’s biopower refers to the disciplinary effects embedded in social institutions like workplaces, schools, and armies and in the “productive” policies that aim to organize and control health, race, gender, size,
age, and other parameters concerning the utility of the population. Biopower also requires forces that resist it. Resistance does not halt biopower; resisting forces require biopower in order to be what they are (Evans 2012; Foucault 1978).

While some may assume that genealogy is a rather historical methodology, others have described genealogy as a kind of “abstractive practice” (Liz 2017). As an abstractive practice, the task is less to glue together the continuity of a certain practice and more to identify instances of a particular practice in order to make a wider judgment about the classification of these practices. For instance, in Discipline and Punish, Foucault presents the distinctively modern scientific-legal complex, from which the power to punish derives its bases, its justifications, and its rules. Specifically, Foucault orients our attention to the contingent and discontinuous nature of history, and he focuses on the technique of punishment by imprisonment in terms of the four main categories of archaeological analysis distinguished in The Archaeology of Knowledge. These are (i) prisoners as a new class of objects; (ii) the formation of concepts, such as the concept of the criminal character; (iii) modes of authority of the judge, of the parole board, and of the criminologist; and (iv) enunciative modalities or other lines of strategies (such as different ways of using solitude and work in the treatment of prisoners) (Foucault 1977 (1995), 1972 (2007): 44–78; Dean 1994). To these, Foucault adds (v) contradictions and oppositions not as secret principles to be revealed but as objects to be described. These categories are not mere linguistic expressions but underlie the power that changes the world (Gutting 2005: 45).

Foucault clarifies the orientation of genealogy by saying that it is a “history of the present” (Foucault 1977 (1995): 31). This history of the present in Discipline and Punish enables attention to the prison system, with all the political investments of the body, and its far-reaching technologies of power over the body in a closed architecture. So the focus is less on how past events unfolded and more on how, in its present form, punishment belongs to a political technology of the body.

As such, Foucault saw genealogy as a way to engage with “effects” beyond the mere description of transformations that take place (Deleuze 2004: 24). In this sense, a Foucauldian genealogy has often been described as a historical causal explanation that is “material, multiple, and corporeal” (Gutting 2005: 47). Foucault’s genealogies deconstruct, by showing their real origin, official meanings and evaluations involved in a society’s self-understanding. Therefore, to provide a genealogy is “to identify the accidents, the minute deviations – or, conversely, the complete reversals – the errors, the false appraisals, and the faulty calculations that give birth to those things that continue to exist and have value to us” (Foucault 1977 (1995): 146). The ultimate objective is not to introduce the question of origin. Genealogical critique will avoid the question of origin, say the origins of slavery. Instead, genealogy reveals the contingency of that which is said to be necessary.

Finally, Foucault’s genealogy evokes an intimate tie between knowledge, power, and resistance (see, e.g., Foucault 1977, 1980, 1981). This is crucial for our analysis of slavery, as Foucault’s basic insights sustain that changes in thought are not due to thought itself but due to the social forces that control and shape the behavior of individuals. In this sense, the twenty-first century outcries for a “second” abolition of
slavery in the context of international law and development emerges as a field of knowledge, a new object of inquiry, and a set of technologies and strategies. Further, for many, the genealogical project is immediately bound to freedom, as it is unfolded in four different theses in Foucault’s thought: (a) freedom and liberation are not the same thing, and, hence, they are not tautological; (b) freedom is a matter of concrete struggles for situated values, for instance, in anti-trafficking struggles freedom is linked to movement free of exploitation; (c) freedom is a historical contingency and, therefore, historically defined; and (d) there is not a necessary end point in the struggle for freedom (see Tamboukou 1999). Therefore, at the heart of genealogies of slavery lies the question of how freedom is being defined.

To engage with genealogies of slavery, in what follows we discern emerging narratives of ambiguity and rupture in international law and international development, specifically in the ways that slavery, trafficking, and modern slavery become intertwined. Within the emerging rather ambiguous liminal space between slavery and human trafficking in case law, policy, and academic literature, it would be misleading to assume that slavery had to mean more or less the same, whenever and wherever it was used. It would also be inaccurate to assume that harm has been central in discussions of slavery.

Case Law and Slavery Discourses

To trace the evolution of slavery in legal discourse through three distinct general periods, from classical antiquity to colonial transatlantic slavery trades and, finally, to contemporary modern slavery, is part of a larger forthcoming project. Here we only focus on contemporary modern slavery, in order to map out a couple of different yet overlapping genealogies. The first is the rise of statistical representations of slavery generated by IGOs, NGOs, and the US Department of Justice (TIP reports), which hailed with force in the late 1990s, and fueled narratives of grand scale victimization for illegalized migrants abused by precarious industries (e.g., ILO n.d.).

The second genealogy culminates with the emergence of new anti-trafficking legal frameworks, in the form of international law, such as the previously discussed Palermo Protocol (2000) and the 2005 Council of Europe Convention on Action against Trafficking in Human Beings (European Trafficking Convention). The Palermo Protocol is the first human trafficking treaty that integrates the “three Ps” approach (prevention, prosecution, protection) as key aspects in the fight against slavery and human trafficking. However, it still reflects the predominance of a criminalization approach that principally focuses on prosecution, with the majority of provisions on victim protection not being mandatory (e.g., Boukli 2016; Milano 2017). In turn the European Trafficking Convention and the 2011 European Union Anti-Trafficking Directive adopt a more holistic “four Ps” approach (prevention, prosecution, protection, partnerships) aiming to balance often conflicting values and objectives.

The third genealogy then takes the form of the existing rather scarce case law on human trafficking and slavery. At the outset, the possibility of a judgment on a
trafficking case using anti-slavery arguments was not clear, since the European Convention of Human Rights (ECHR) does not include an express prohibition of human trafficking. As pointed out by critics, the European Court of Human Rights (ECtHR) finally decided to adjudicate trafficking cases through the application of its “living instrument” doctrine (see Milano 2017: 703). Particularly, below the focus turns to the ECtHR’s judgments of Siliadin v. France (2005), Rantsev v. Cyprus and Russia (2010), and L.E. v. Greece (2016). These are particularly important judgments because when considering the judgments of the ECtHR’s sister regional tribunals – the inter-American or the African human rights courts – only the former has established state responsibility on the basis of human trafficking in a single case (see Hacienda Brasil Verde Workers v. Brazil), while slavery, servitude, or forced labor cases have been examined and adjudicated. As such, it is fair to say that (1) human trafficking is too rarely exposed to judicial scrutiny in relation to the gravity and dimensions of the phenomenon, as evidenced by the fact that trafficking cases have been scarcely dealt with in the legal system; (2) cases of slavery have been more readily adjudicated as opposed to human trafficking; and (3) even when human trafficking cases are adjudicated, the main focus is on states’ obligations in relation to private actors’ abuses. Simultaneously, UN treaty bodies have never found a state responsible for violating the prohibition of human trafficking and the positive obligations it entails. From what follows, it becomes evident that through the ECHR and recent jurisprudence of the ECtHR particularly on ECHR Article 4, a rupture with previous judgments occurs in the liminal space where slavery and trafficking meet. In this context, ECHR Article 4 provides that “[n]o one shall be held in slavery or servitude” and that “[n]o one shall be required to perform forced or compulsory labour.” It is also established case law of the ECtHR that the positive obligations under ECHR Article 4 are absolute. ECHR Article 4(3) excludes from the ambit of the prohibition on forced or compulsory labor situations where the labor is carried out in the course of a prison sentence or conditional release, military service, any service “in case of an emergency or calamity threatening the life or well-being of the community,” or “any work or service which forms part of normal civic obligations” (Art. 4(3)).

**Siliadin v. France, No. 73316/01, ECtHR 2005-VII**

Starting with the ECtHR decision Siliadin v. France (2005), France was unanimously found in breach of the prohibition of slavery, servitude, and forced and compulsory labor under the ECHR, Article 4 “Prohibition of slavery and forced labour.” This constituted the first judgment delivered by the ECtHR relating to both slavery and potentially human trafficking, and the events of the case indeed attest to these elements. Ms. Siliadin was 15 years old when was brought from Togo to France to study. This was part of the initial agreement between Ms. Siliadin’s father and Ms. D, the person who took her to France. Ms. Siliadin was forced instead to employment as domestic servant in Ms. D’s private household. Her passport was
confiscated; she worked 15 h per day without a day off and without any payment for several years. Simultaneously, her plans to study did not come to fruition.

Before the ECtHR, Ms. Siliadin maintained that France was in breach of Article 4 of the ECHR for not having effective criminal legislation to prevent and combat slavery, servitude, and forced labor. While the above facts arguably fit a human trafficking case, the ECtHR took a different view (see Piotrowicz 2012; Milano 2017). Importantly, the ECtHR examined what conduct is prohibited under Article 4 of the ECHR, as well as what the scope of state’s positive obligations in relation to the conduct is. Regarding the former, Article 4 of the ECHR shows that in the event of an employment situation leading to grave abuse, slavery or servitude, and forced or compulsory labor, individuals can make a complaint. Following the definitions included in the 1930 Forced Labor Convention, the 1926 Slavery Convention, and the 1956 Supplementary Convention on the Abolition of Slavery, the ECtHR distinguished between slavery, servitude, and forced labor and proceeded to examine whether this case fell within one of these categories.

Specifically, following the 1926 Slavery Convention “slavery is the status or condition of a person over whom any or all of the powers attaching to the right of ownership are exercised.” This corresponds to the “classic” meaning of slavery as it was practiced for centuries. However, the ECtHR concluded that while the applicant/ Ms. Siliadin was clearly deprived of her personal autonomy, the evidence did not suggest that she was held in slavery in this “classic” sense. As a genuine right of legal ownership was not exercised over her thus reducing her to the status of an “object” (Siliadin, para 122). Instead, the ECtHR reached the decision that Ms. Siliadin was subjected to servitude and forced labor. In terms of the term “servitude,” the ECtHR concluded that “servitude” means an obligation to provide one’s services that is imposed by the use of coercion and is loosely linked to the concept of “slavery” described above. To determine this point, the Court considered that the applicant was a minor, an irregularized migrant, afraid of being arrested by the police, and therefore vulnerable, isolated, and with no means of living elsewhere than in the home of her employers.

While this decision was celebrated for its significance in proving the ECHR as a living instrument with an increasing relevance to labor rights (see, e.g., Mantouvalou 2006), it also drew some criticism with regard to the understanding of slavery. The criticism was based on the applicability of Article 4, arguing that the better approach would be to understand the prohibition of slavery as both de jure and de facto and therefore also making this judgment on the basis of slavery possible today (see, e.g., Milano 2017). The decision was further criticized on the adjudication of state’s positive obligations in relation to the conduct, as the ECtHR focused solely on the positive obligation to enact criminal law provisions. Arguably, this stance shows a preoccupation with slavery as a situation pertaining to a person’s legal status. As far as the substantive harms inflicted on the victim, such a stance fails to address issues such as victim protection, prevention, and restitution, as well as wider amends such as decriminalization of irregularized and exploited children, for the purposes of accessing education and services.
Following on from this, in *Rantsev v. Cyprus and Russia* (2010), the focus shifts from domestic servitude to labor exploitation and human trafficking. The Court was confronted with the issues of irregularized noncitizens in Cyprus being employed under “artiste” visas and work permits. This was the first judgment, in which the ECtHR focused explicitly on human trafficking. In this case, the applicant, Mr. Rantsev, the father of a Russian national, brought a complaint against Cyprus and Russia in the ECtHR in relation to the death of his 20-year-old daughter, Ms. Oxana Rantseva. Ms. Rantseva was a Russian national who entered Cyprus under an artiste visa and work permit to work in a cabaret, an arrangement that was “well known and commonly acknowledged” to be associated with sexual exploitation of foreign women coming to Cyprus mainly from the former states of the Soviet Union (*Rantsev*, paras 83–85). Upon attempting to escape, she was found by the manager of the cabaret, Mr. M.A., who took her to a police station in order to process her deportation. Upon arrival, Mr. M.A. explained that Ms. Rantseva had only recently arrived in Cyprus and had left her employment without warning and had also moved out of the accommodation provided to her. Mr. M.A. then handed her passport and other documents to the police officers. The police failed to investigate Ms. Rantseva’s possible subjection to trafficking for sexual exploitation but only checked whether her name was on a list of persons wanted by the police. On finding that she was not, they asked the cabaret manager to return and collect her. Subsequently, Mr. M.A. took Ms. Rantseva to the apartment of an employee of his. A few hours later, she was found dead on the street below the apartment, having fallen from the second floor of the building in “ambiguous and unexplained,” “strange circumstances” (*Rantsev*, paras 41, 51, 62, 234).

As part of his complaint, Mr. Rantsev argued that an effective investigation into the circumstances surrounding the death of his daughter should have included the persons or methods involved in the recruitment of Ms. Rantseva. Particularly, he claimed that Cyprus and Russia had violated their obligations under Article 2 of the ECHR to conduct an effective investigation into the circumstances of the victim’s death. He pointed to alleged contradictions between the autopsies of the Cypriot and the Russian authorities, and his requests to Cyprus through the relevant Russian authorities, for further investigation of apparent anomalies, were not followed up by the authorities. Part of his complaint also built on the fact that he was not informed of the progress of the case or of other remedies available to him.

In considering the case, the Court found that the adoption of the Palermo Protocol as well as of the European Trafficking Convention has demonstrated the increasing prevalence of human trafficking at international level and the need for measures to combat it. Further, the International Criminal Tribunal for the Former Yugoslavia’s judgment in *Kunarac* was brought to appraise the concept of slavery, in an effort to depart from the restrictive interpretation of slavery adopted in *Siliadin v. France*. In considering this context, the ECtHR established the incompatibility of human trafficking with the values of the ECHR and with the wider international legal norms. While this was a decisive step, it is important to consider how approaching
trafficking through slavery as a juridical concept entails an ambivalence toward addressing effectively the substantive harms inflicted.

Firstly, the ECtHR examined what conduct is prohibited under Article 4 of the ECHR and concluded that human trafficking falls within the realm of Article 4 of the ECHR, without offering any further guidance as to how this is the case. Rather vaguely, trafficking was described as based on the exercise of powers attached to “ownership,” which applies to chattel slavery and “to a different degree” to trafficking, as a contemporary form of slavery (see Rantsev, para 142). This however has been described as an “arbitrary limitation” (see Milano 2017: 706), since the Palermo Protocol and the European Trafﬁcking Convention deﬁne human trafﬁcking as a set of acts that include various forms of exploitation separate from and perhaps also including slavery.

Secondly, the ECtHR considered again what the scope of state’s positive obligations in relation to the conduct is. In this respect, the ECtHR ruled that the complaints about the states’ obligation under Articles 2, 4, and 5 were admissible. In explaining these obligations, the ECtHR implicitly referred to the “three Ps” approach (prevention, prosecution, protection), by asserting that States should be taking steps to identify people at real and immediate risk of being trafﬁcked. Accordingly, the Court considered the procedural elements in investigations of potential trafﬁcking and found that Cyprus was in breach of its obligations: Cyprus failed to adapt a framework that prevented the risk of human trafﬁcking and handed Ms. Rantseva back to her trafﬁckers, failed to enact criminal law provisions, and failed to enact an effective investigation into Ms. Rantseva’s death. In its decision the Court held that there has been a violation of Article 4 by Cyprus by not affording to Ms. Rantseva practical and effective protection against trafﬁcking and exploitation in general and by not taking the necessary measures to protect her. Simultaneously, the Court determined that there was no need to examine separately the alleged breach of Article 4 concerning the failure of Cypriot authorities to conduct an investigation. Therefore, effectively, the Court conﬂated the lines between protection and investigation (see also Ch. 79, “European Court of Human Rights and the Right Not to Be Subjected to Slavery, Servitude, Forced Labor, and Human Trafﬁcking” by Stoyanova, V. in this volume).

Thirdly, the ECtHR also found a procedural violation of Article 4 by Russia, awarding 2,000 euros for nonpecuniary damages sustained by Mr. Rantsev due to the conduct of the Russian authorities but ruled that he was not entitled to other claims such as travel expenses, translations, or funeral costs, to obtain the necessary funds for which Mr. Rantsev had sold his home in Russia. Hence, the above three aspects of the Court’s decision arguably illustrate considerable limitations in acknowledging and addressing a range of substantive harms involved in human trafﬁcking.

**L.E. v. Greece, No. 71545/12, ECtHR 2016**

Finally, in *L. E. v. Greece*, the ECtHR makes a second attempt at distinguishing slavery and human trafﬁcking. To summarize the facts, Ms. L.E., a Nigerian woman born in 1982, entered Greece in June 2004 accompanied by Mr. K.A. He had
allegedly promised her that he would take her to Greece to work in bars and nightclubs in exchange for a pledge to pay him 40,000 euros. Upon arrival in Greece, Mr. K.A. confiscated her passport and forced her into prostitution for approximately 2 years. Eventually Ms. L.E. contacted Nea Zoi, a nongovernmental organization, which provides support to trafficked women. In July 2004 Ms. L.E. had applied for asylum but did not take a place that was reserved for her at a reception center for asylum seekers in June 2005. Subsequently, she was arrested for prostitution and immigration law violations. In that instance she was acquitted by the Court, but she was arrested again in March 2006 and then convicted at first instance and acquitted on appeal. In April 2006 an expulsion order was issued against her by the police, but this was suspended. In November 2006, Ms. L.E. was again arrested for prostitution, tried, and acquitted, but she was subsequently detained awaiting deportation, as she did not have a residence permit in Greece. While in police detention, Ms. L.E. lodged a criminal complaint against Mr. K.A. and his partner Ms. D.J., claiming that she was a victim of human trafficking and accused them of forcing her and two other Nigerian women into prostitution. The prosecutor dismissed her complaint and her claim that she had been a victim of human trafficking. Ms. L.E. applied for a reexamination of her complaint in January 2007, and this time the prosecutor brought criminal proceedings against Mr. K.A. and Ms. D.J. for the offense of human trafficking. Ms. D.J. was subsequently arrested and remanded in custody, but in 2012 a Court held that she was not an accomplice but another victim of Mr. K.A. The Greek authorities renewed Ms. L.E.’s residence permit until 2014.

The ECtHR was asked to consider the issues also presented in Rantsev, namely, the applicability and relevance of Article 4 to trafficking, as well as the scope of positive obligations arising by the general principles derived from Article 4. The ECtHR, however, merely reaffirmed that human trafficking falls under Article 4 of the ECHR without elaborating on the relation between slavery and human trafficking. As regards the positive obligations, the Court accepted that Articles 2, 3, and 4, enshrine the fundamental values of the democratic societies making up the Council of Europe and that, therefore, the scope of positive obligations should be expanded to grant further protections. Greece’s national legal framework (Article 351 of the Greek Criminal Code in line with the Palermo Protocol and the European Trafficking Convention) was found capable of providing Ms. L.E. with practical and effective protection. Nevertheless, the Court’s approach toward the assessment of the effectiveness of Greece’s legal and administrative framework relating to human trafficking has been criticized as very superficial and lacking in rigor (Stoyanova 2016). The Court failed to acknowledge that Ms. L.E. had been arrested several times prior to receiving any form of protection from the Greek authorities. On the other hand, the Court’s reaffirmation of the positive obligations of states under Article 4 of the ECHR and more specifically its view that a lack of promptness, several delays, as well as other procedural failings constitute a violation of Article 4 has been welcomed as a positive development given the scarcity of relevant case law. The ECtHR also held that in this case, there had been violations of Article 6§1 (due to failing to meet the “reasonable time” requirement) and Article 13 (for complaints about the length of proceedings). As a result, Greece was to pay Ms. L.E. €12,000 for nonpecuniary damages and €3,000 for costs and expenses.
When considering such cases, it is hard to escape the feeling that formal justice processes are just tinkering around the edges: the harms suffered by the victims remain substantively unaddressed. These cases also offer an urgent reminder that what we define as slavery encompasses other acts that have been normalized and naturalized, such as the everyday workings of the capitalist system. While there exists a sizeable arsenal of punitive measures, beyond these there is a lack of alternative solutions. When it comes to right entitlements, it is mostly in *Siliadin v. France* (para 49) where the Court refers to rights for domestic workers guaranteeing: the recognition of “domestic work in private households as ‘real work’, that is, to which full employment rights and social protection apply, including the minimum wage (where it exists), sickness and maternity pay as well as pension rights”; “the right to a legally enforceable contract of employment setting out minimum wages, maximum hours and responsibilities”; “the right to health insurance”; “the right for migrant domestic workers to an immigration status independent of any employer”; “the right to change employer and travel within the host country and between all countries of the European Union and the right to the recognition of qualifications, training and experience obtained in the home country.” However, overall there is a lack of continuity in addressing right entitlements and in putting them into action.

**SDGs and Slavery Discourses**

In the field of international development, spearheaded by the United Nations, consecutive frameworks, namely, the Millennium Development Goals (MDGs) (2000–2015) and the Sustainable Development Goals (SDGs) (2015–2030), have attempted to consolidate the agendas of development, climate change, equality, employment, and sustainability since the late 1990s. Soon after their conception in 2000, the MDGs became arguably the “yardstick” of development progress and a new development “paradigm” (Gabay 2012; Tiwari 2015: 314). Drawing attention to development that included both economic drivers but also noneconomic dimensions, such as health, education, and gender, the MDGs signaled a new aspirational era, through the echoing commitment to reduce poverty and address human deprivations. Perhaps unsurprisingly, the MDGs were described by the UN secretary-general as “the most successful global anti-poverty push in history” (UN 2013).

Against the backdrop of success, the MDGs were superseded by the post-2015 SDGs agenda. The latter was being conceived amidst acute financial uncertainties spanning over the last 10 years, predictions of spiralling inequalities, and poverty. For critics, the SDGs themselves attest to the timid accomplishments of the MDGs era while incorporating the core themes of poverty, education, health, and the remaining unmet targets in the post-2015 development discourse (see, e.g., Tiwari 2015). The SDGs were adopted at the UN Sustainable Development Summit of September 25, 2015, by the High-level Political Forum on Sustainable Development in the Resolution adopted by the General Assembly on September 25, 2015, 70/1 Transforming our world: the 2030 Agenda for Sustainable Development (A/Res/70/1). In principle, the SDGs offer a systematic agenda for global development between 2015 and 2030 grounded upon 17 Sustainable Development Goals.
While prior to the SDGs, there were piecemeal references to slavery and trafficking in international development and a lack of referencing of either slavery or trafficking in the MDGs (UN 2015 The Millennium Development Goals Report), the 2030 Agenda created an ambiguous, liminal space for the coexistence of slavery and trafficking under the same goal. This complimentary or arguably metonymic use of slavery for trafficking and vice versa has been intimated in various places. References to human trafficking are scattered throughout the 2030 Agenda, for instance, Goal 5.2 sustains that states should “[e]liminate all forms of violence against all women and girls in the public and private spheres, including trafficking and sexual and other types of exploitation.” Further, Goal 16.2 sets out that states should “[e]nd abuse, exploitation, trafficking and all forms of violence against and torture of children.” In its Declaration (para 27), human trafficking is linked to forced labor, since states should “eradicate forced labour and human trafficking and end child labour in all its forms.” While, redistribution of resources and sharing of wealth should also be part of addressing slavery and human trafficking: “[s]ustained, inclusive and sustainable economic growth is essential for prosperity. This will only be possible if wealth is shared and income inequality is addressed” (para 27).

Explicit references to the link between slavery and human trafficking as well as between slavery, human trafficking, forced labor, and child labor have been made via Goal 8. According to this, [states must] “[p]romote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all.” Further, specifically through Goal 8.7, states should:

[t]ake immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.

In this sense, the link between slavery and human trafficking has culminated in “transfers of meaning” (Nunberg 1995). Whereby, the discursive use of slavery presupposes a co-dependency with human trafficking. If the word “slavery” is then used in a transferred sense, it is possible to use the word to refer to disjointed sorts of things. This is not the same as the limited possibilities of substitution; the mechanisms are not trying to substitute “slavery” with “human trafficking” but to construe a new field of knowledge and study of inquiry, according to which slavery is transferred upon human trafficking and vice versa. This would serve a dual target: to either interdefine slavery and human trafficking by imposing some apparent sortal crossings between the two or to present that solutions to the one are densely metonymous to the solutions to the other.

In parallel with the legal cases examined earlier, arguably, the language of state responsibility has transpired in the SDGs’ attempts to predicate transfer. However, concerns have been raised about the actual push for state responsibility and accountability (e.g., Barry 2003; Young 2006). Particularly, in the repeated references to “consideration for national circumstances” and in vague obligations for
nongovernmental actors, a causal sense of responsibility is missing or at best “is hidden between the lines in paragraphs on poverty, debt and environmental issues” (Bexell and Jönsson 2017: 18). As such, critics have maintained that as with the MDGs, the SDGs have been masking root causes of the problems, while neglecting how power relations may impede accountability and real change.

**The UK, Slavery, and the SDGs**

As discussed above, the MDGs were inclusive of many key development issues, but not of human trafficking nor slavery. This changed with the SDG negotiations in 2015, and now slavery and human trafficking are mentioned in a number of the SDGs, most notably in 8.7. This significant change did not just happen on its own. There were protracted international negotiations as to what would be included and excluded from the final agreed version of the SDGs. A number of reasons could be attributed to this inclusion. Arguably that slavery is on the increase and that an effective coalition of interested parties has come together to influence its inclusion in the development agenda. Key players have been NGOs, the ILO, as well as some governments, such as the UK government.

Within the UK, discussions around linking modern slavery to poverty and inequality commenced in 2007, when the UK government, the International Labour Organization, as well as the NGO Anti-Slavery International (ASI) held a high-level cross-sector conference with the aim to connect the issues of “poverty, development and the elimination of slavery” (McQuade 2015). According to ASI, the decisive moment in forcing the idea of slavery onto the sustainable development agenda occurred in late 2013, at a conference called by Pope Francis in the Vatican. Adrian McQuade (2015), the director of ASI, recalls that this conference felt like a “last cast of the die” to get the issue of slavery onto the international development agenda:

> with the endorsement of the Pope something of a critical mass started to form around the issue with the British Government, particularly its Anti-Slavery Commissioner Kevin Hyland, Jeffrey Sachs, an adviser to the UN Secretary-General Ban Ki-moon, and others endorsing the idea.

Formally, the Modern Slavery Bill in the UK was first debated in June 2014. In its second reading, the then Home Secretary, Theresa May MP, clearly articulated its vision along the lines of “more arrests and more prosecutions”: “tackling modern slavery will require . . . a determined and focused law enforcement response” (House of Commons [8 July 2014, column 166]). Eventually, the parliament passed the Modern Slavery Act in 2015. The Act is focused on the criminalization of modern slavery and human trafficking and the establishment of the Anti-Slavery Commissioner whose role focuses on prevention of modern slavery offenses and identification of victims. These developments have been linked directly to the final stages of the SDG negotiations, as it was the work of the UK government [in addition to the
efforts of the UK, South Africa, and Argentina], the Vatican’s Pontifical Academy of Social Sciences, the “Santa Marta Group: Church and Law Enforcement Combating Modern Slavery,” and some of G77 governments that “Ending modern slavery and human trafficking” was accepted as an amendment and added into SDG 8 (Anti-Slavery Commissioner n.d.; Anti-Slavery Commissioner 2016).

While the UK government responded to and worked with interest groups to include human trafficking and anti-slavery targets in the SDGs, these goals and targets are up for interpretation by governments, and the SDGs are not legally binding instruments. So, while the UK government’s interpretation of the SDGs has been in line with enacting legislation and setting up the Anti-Slavery Commissioner, these measures do not focus on the causes of slavery and the links to poverty (the original reason for linking slavery to the SDGs) but on the criminalization of human trafficking and the blending of human trafficking with slavery.

**Conclusion**

From our investigation two key points become evident. Firstly, in recent decisions of the ECtHR and in the SDGs, the discursive use of slavery presupposes a contiguity with human trafficking. The word “slavery” is then used in a transferred sense, and, hence, it is possible to use the word to refer to disjointed meanings. This is not the same as the limited possibilities of substitution; the mechanisms are not trying to substitute “slavery” with “human trafficking” but to construe a new field of knowledge and study of inquiry, according to which slavery is transferred upon human trafficking and vice versa.

Secondly, while one may assume that merging slavery and human trafficking may shed light on structural causes, such as poverty, income inequality, injustice, discrimination, exclusion, (un)freedom of movement, (un)freedom from want, and a variety of harms related to unequal access to services that underpin both human trafficking and slavery, this is not the case. As the existent case law is concerned, the spotlight is on crime, crime control, and criminalization. Simultaneously, the available solutions of decriminalizing irregularized migrants and offering access to an indiscriminate regime of rights are being cast aside. As far as development is concerned, there is an undeniable gap between the purported targets and the measures used to achieve these targets.

As a result of the above, this chapter puts forward a different set of recommendations (see also Boukli and Renz 2018). It counterposes a zemiological approach, which focuses on the harms rather than the crimes. This would involve prioritizing the communities and the people involved in human trafficking rather than focusing on formal mechanisms that ostracize and criminalize survivors. This would also involve an evidence-based discussion of trafficking that may actually reduce harm by pointing to areas that require better legal protection to prevent victimization, better access to resources, and better support mechanisms to survive and overcome harm. The orienting target is not abolition as a legal/juridical model of anti-slavery but advancing structural changes against harm.

Abstract

The goals of the chapter are threefold: (1) to provide an overview of the study process/approaches that supported the context and development of survivors’ critical consciousness about their oppression, (2) explore socially constructed root causes related to reintegration, and (3) unpack what successful reintegration means to survivors. Despite academic, media, nongovernmental, and governmental interest and reports related to sex trafficking, comparatively little attention has been given to the adjustment experiences of survivors in their post-trafficking period. Additionally, the participatory approach of social justice research, supporting vulnerable populations to become more involved in an academic

J. Winterdyk, J. Jones (eds.), The Palgrave International Handbook of Human Trafficking, https://doi.org/10.1007/978-3-319-63058-8_13
study, is still marginal. In an attempt to level these troughs, participatory action research was used to explore trafficking survivors’ common subjective experiences in their reintegration.

Introduction/Context

The trafficking of women for sexual exploitation is a serious global issue (Cree 2008; Dhungel 2017a, b, c; Huda 2006; Samarasinghe and Burton 2007; Winterdyk et al. 2012), requiring attention from national and international communities (Cameron and Newman 2008; Dhungel 2017d; Troubnikoff 2003). Sex trafficking continues to be globalized, and “Nepal is not exempt.” Indeed, Nepal is well-known as a source country for human trafficking in general and sex trafficking in particular, especially of women and children (Adhikari 2011; Chaulagain 2009; Parker 2011; Sharma 2014; US Department of State 2018). The 1950 treaty between Nepal and India, which established an open border between the two countries (Nepal India Treaty 1950), has unfortunately contributed to the growing numbers of women and children trafficked from Nepal to India (Richardson et al. 2009; Sharma 2014; Simkhada 2008). Furthermore, Frederick et al. (2010) identified the rise of new markets in destination countries beyond India – notably South Korea, Japan, Thailand, China, and countries of the Middle East – and an increase in trafficking for labor purposes, mainly in restaurants and massage parlors, which later turned into sex trafficking.

Nepal, a landlocked country in South Asia, bordered to the north by China and to the south, east, and west by India, is culturally, ethnically, and religiously diverse (National Census Report 2012). It spans an area of 147,181 square kilometers and has a population of approximately 27 million people. Nepal is divided into three geographical regions – the Southern Terai (plains), the Central Highland (hills), and High Himalayan Mountains (mountains) (Dhungel 2017d). About one-half of the population resides in the plains bordering India, with the remainder living in the hills and mountain regions (National Census Report 2012). The economy is dominated by agriculture; 66% of the total population is agro-based and contributes about 34.7% of the gross domestic product (http://www.doanepal.gov.np/). Tourism is the second largest industry in Nepal and is the source of foreign exchange and revenue generation.

Nepal is currently governed by the Constitution of Nepal, which came into effect on September 20, 2015, replacing the Interim Constitution of 2007 (The Constitution of Nepal 2015). According to the Constitution, “rights of gender and sexual minorities are protected with provisions of special laws and this clearly states that women shall have equal ancestral rights without any gender-based discrimination” (Section 18). The inclusion of women’s rights was not unique to this Constitution, as they were also codified in the Interim Constitution of 2007. However, studies have demonstrated that despite the Constitution’s guarantee of gender equality, women still, in practice, experience a subordinate position. Many women depend primarily upon the social and economic positions of their husbands and fathers, perpetuating a patriarchal paradigm that facilitates gender-based discriminatory practices in family,
society, and political realms (Chaulagain 2009; McNeill 2008). Aengst (2001) made the trenchant comment that “the lack of economic alternatives for girls and ingrained cultural beliefs regarding gender roles make young girls particularly vulnerable to trafficking” (p. 5).

This chapter, which explores the implications of the above, is based on information obtained from a community-based participatory action research initiative entitled “Reintegration of trafficking survivors in Nepal.” The chapter is organized into three main sections, with the first section outlining the participatory process of the study. The second section speaks to reintegration issues faced by trafficking survivors and looks at the existing reintegration model followed by a critical discussion of current anti-trafficking practices. The third portion concludes with an examination of how trafficking survivors define the term *successful* reintegration. The chapter concludes with a discussion of areas that need further academic, policy, and practice attention, specifically in Nepal, but which can also be applied more broadly.

**Praxis: Participatory Action Inquiry**

This section begins with an examination of participatory action research (PAR) and will then discuss how the study process evolved and helped co-researchers understand aspects of their own oppression. PAR is deeply rooted in the adult education movements of Latin America, largely due to the work of Brazilian educator Paulo Freire (Fals-Boarda 1987; Levine and Yeich 1992; Freire 1972). Freire fundamentally believed that critical reflection was important for both personal and social transformation (Maguire 1987; Selener 1997). Freire (1972) championed participatory and inclusive investigations that allow people to identify and analyze their own situations/issues in response to a broad range of oppression. PAR offers an opportunity for people (especially oppressed populations) to critically and collectively analyze existing social, political, and economic situations and act together to address immediate problems and advocate for social change. Boal (1979) suggested that the process of education for concretization encourages passive audiences to become active participants and make decisions for themselves with their transformative capacities, rather than watching as others not only make decisions for them but also act ostensibly on their behalf.

McTaggart (1991) argued “PAR begins small and is developed through the self-reflective spiral: a spiral of cycles of planning, acting (implementing plans), observing (systematically), reflecting and re-planning, further implementation, observing and reflecting” (p. 175). This dialogical process (praxis) promotes the growth of the critical consciousness of participants, empowering them and promoting personal and social transformation (Fals-Borda 1987; Maguire 1987; Park 1993; Reason and Bradbury 2006). The following paragraphs will provide an overview of the application of praxis in this study.

The eight female trafficking survivors, ranging in age from 23 to 37, were recognized as co-researchers in this collaborative study process. The women were born outside of Kathmandu, mainly in high-risk communities in rural areas for
trafficking, and were first trafficked from the ages of 7 to 25. Four survivors were married, and four of them had children. With respect to their faith, five were Hindus and three were Buddhists. All the women were currently employees of the anti-trafficking agency, Shakti Samuha.

The research process began when the researcher and the co-researchers met and discussed the study’s purpose and their respective roles in the process. Not surprisingly, some challenges were experienced especially when the women demonstrated their initial reluctance to participate in the study. This was because they were exhausted by sharing their stories on trafficking both with researchers or/and practitioners over a significant period of time. For example, one of the women asserted, *There are so many researchers... research on trafficking issues. We were often asked to share our experiences on trafficking with a focus on brothels, and this makes us feel angry. We absolutely do not want to be interviewed for or support... research.*

In responding to the women’s understandable concerns, the researcher conveyed a clear message that she would not ask them to talk about their experiences of being trafficked, as this is only one part of their story. By highlighting the important and essential roles of the co-researchers in this study, the researcher encouraged them to be leaders and take a key role in helping the study run smoothly. By using ice-breaking exercises, the researcher was able to create a welcoming, inclusive, and safe environment that made the women feel at ease. Essentially, when the women learned that the values and nature of the project would not only promote their autonomy and collective power but would also advance their personal and social transformation, they graciously agreed to support the project and play key roles in the collaborative journey. As the study progressed, their participation in critical dialogues and reflections on reintegration, through the use of transformative approaches such as photovoice, group meetings, and interviews with a variety of sector stakeholders, made them feel more empowered. The process also helped them critically understand their own oppression and develop and implement strategies to address issues associated with reintegration (Dhungel et al. 2019). The women were significantly involved in data analyses including coding, categorizing, and developing themes. Through praxis (action-reflection-action), the women performed street dramas, organized a press conference, and explored different advocacy strategies. For example, the group met with the Ministry of Women, Children, and Social Welfare to advocate for policy/program changes informed by the process. In summary, through praxis, the women were involved in identifying and understanding their own oppression and addressing issues through a number of transformative tools.

**Reintegration of Trafficking Survivors**

This section will outline how agencies and stakeholders working in anti-trafficking efforts perceive the term “successful” reintegration. A range of stakeholders, including the Government of Nepal, agencies, the media, lawyers, police officials, and the general public, shared key indicators used to measure the reintegration success of trafficking survivors (Fig. 1).
The majority of stakeholders reported that family acceptance was instrumental for successful reintegration. To be reunited with parents and siblings and to live with them in their communities is successful reintegration. Community acceptance was also suggested as another important indicator that stakeholders used to measure the success of reintegration. However, stakeholders expressed a belief that in most cases, a survivor while accepted by her family was rejected by her community. Without community acceptance, then a survivor’s reintegration was only partial and incomplete. According to stakeholders, a married survivor was perceived as a successfully socially reintegrated woman. Until a survivor gets married, she was not considered as reintegrated. Employers generally did not hire survivors, regardless of education, skills, and experience once their trafficked past came to their attention. According to stakeholders, employers were afraid that if they hired survivors, they would ruin the public image of their organizations, and thus survivors were expected to work mostly in restaurants and massage parlors. Despite this grim portrait of the reality, stakeholders generally expressed their support for the rights of survivors to live with respect and dignity. The stakeholders also suggested that government should provide free health services to survivors, and their social and economic futures should be

![Diagram](image-url)
secured by providing them with appropriate employment and education. They argued that the Nepalese Government had the primary responsibility (and mandate) to ensure that these changes occur. Stakeholders also highlighted that survivors were particularly suited to bring reintegration issues into a public forum, through storytelling, awareness raising campaigns, and multi-sectoral policy advocacy (Dhungel 2019).

The survivors critically identified and analyzed the systemic oppression that made their lives more susceptible to socioeconomic marginalization. These challenges are interlinked and mutually reinforcing (Dhungel 2017d). The key elements – discussed below – of this dynamic of oppression and marginalization are (1) gender oppression, (2) systemic enablers of oppressions, (3) sociocultural and religious exclusions, and (4) research, media, and publications.

**Gender Oppression**

Gender oppression is a compounding, serious, and multilayered factor faced by trafficking survivors in their reintegration process (Dhungel 2017d). Gender oppression in Nepal is deeply rooted and grounded in the values of “patriarchal paradigms” and is manifest in a number of structural dimensions, such as the “feminization of poverty.” For instance, many women are forced to live in poverty due to their lack of education and perceptions of their familial roles. Likewise, the values and power of women and men are still perceived differently in many ways, particularly in terms of constructions of notions of gender and sexuality. Societal norms, for example, encourage men to have multiple partners, while women are expected to be virgins at marriage and remain faithful thereafter. And, for survivors of trafficking, the general construct of sexually appropriate roles and behavior is compounded by continued exploitation. The fact that women were victims of sexual exploitation through trafficking is compounded by their subjugation to derogatory terms such as a “bhaalu,” a “randi,” and a “HIV ko Poko” on their return to Nepal. This represents an intersection of both gender and sexual oppression.

This multifaceted level of exploitation is made even more complex by the global institutionalization of the feminization of poverty. This greatly contributes to women’ and children’s vulnerability to sex trafficking and socioeconomic marginalization upon reintegration. To help counter this, progressive local non-governmental agencies, in collaboration with international nongovernmental organizations and the Government of Nepal, are supporting survivors in their reintegration by providing them with job opportunities based on their education and capabilities/skills. However, the provision of programs does not necessarily mean that social problems are adequately addressed. Although the women wanted to gain more formal education and build their knowledge and capacities in a field of their choosing, the programs offered tended to focus more on skills building and training in traditional areas such as knitting, sewing, and making jewelries, which have limited earning capacity and can perpetuate economic and social marginalization. In many cases, incomes were not sufficient to allow them full access
to resources, including higher secondary and post-secondary education, along with the development of knowledge/skills required for job and career advancement. In the words of one co-researcher:

\[\ldots\] The government and agencies claim that there was good enough support for survivors in that they were supporting us by providing jobs. But\ldots Does anyone know any survivors who are working with the Government? \ldots Do they have any mechanisms to hire us in their reintegration policies? Not even in peon [Survival] jobs. The term reintegration is only in policies, not in practice. \ldots It is very obvious, but no one admits this. The reality is we are expected to work in restaurants and massage parlors.

**Systemic Enablers of Oppressions**

In addition to gender-based oppression, there are key institutional barriers which do not support survivors in their reintegration, such as the absence of progressive reintegration laws and policies, the provision of burden of proof, and the protracted criminal judicial procedures. The Government of Nepal has not developed reintegration laws, and existing reintegration policies are neither progressive nor effective. To elaborate, upon return to Nepal, a survivor is taken to one of the eight rehabilitation centers but, unfortunately, cannot stay for more than 1 year. This period is not long enough, especially when a person is diagnosed with a chronic illness requiring more medical attention. Additionally, the study found that the government has a reintegration fund for trafficking survivors and that 50% of the fund should be distributed to trafficking survivors for personal growth and financial support; however, in practice the money rarely reaches them.

The study also identified that the manner in which trafficking survivors understood their reintegration experience was strongly affected by their perception that the state and community did not hold traffickers accountable. Survivors reported they did not feel *successfully* reintegrated until the specific traffickers who had betrayed and sold them in brothels were prosecuted and penalized. When a survivor returned, she could file a case against the trafficker who sold her. But most cases were dismissed because the survivors were unable to provide sufficient evidence to prove the person guilty. Survivors reported that, in some cases, traffickers had good connections with political leaders who used their connections to dismiss the case or ensure that the trafficker was found not guilty. Indeed, the Nepalese judicial system actively discourages the survivors’ pursuit of justice by placing too much burden of proof onto them. Equally importantly, survivors experience the challenge of lengthy judicial procedures, which has an impact on their current lives. One co-researcher shared:

*Seven years ago, I filed the case within one year of returning to Nepal and the court process is still going on. \ldots It was just last month, they called me when I was with my family at home and therefore I did not answer the phone. My family does not know anything about me and my case in the court. After an hour, they called me on my cell phone again and I was in the kitchen at that time and my husband answered the phone. He found that I was involved in a*
I became very nervous and told him I was supporting a trafficked woman in her case through my work, but he did not believe me and said he was going to find this out from other sources. I am feeling low every day, thinking what happens if he knows it was not someone else but that it was me dealing with the court. Then my family life will be destroyed. Every day I am living with this fear in my reintegration. My married life is not safe.

Sociocultural and Religious Exclusion

Religious faith and traditional cultural values play a strong role in Nepalese society. People tend to be adherents to Buddhist, Hindu, and other faiths, and participation in the respective rites and ceremonies is widely expected and valued. However, this study revealed that the survivors experienced religious exclusion, both externalized and internalized, which hindered reintegration. To be excluded from religious community and expression, for instance, can cause particular shame and hurt for many survivors. An experience that is supposed to bring comfort instead brings pain and ostracism. Religious exclusion enhances vulnerability to sociocultural marginalization and further humiliation. For example, one co-researcher lamented:

One of my neighbors had a religious ceremony and unmarried girls from the community were invited to worship at the ceremony and obviously, the girls should be virgins. . . The way they treated me was very offensive. When I was in line to be worshipped, they said very rudely that I did not deserve this honor as they did not regard me as an unmarried because I already lost my virginity by sleeping with several men in India. I was asked to get out of the line and I then came back to home with lots of tears.

Furthermore, many experienced social condemnation, silence, and exclusion which led survivors to isolate themselves from family and community as a way to avoid further humiliation and as an expression of their own internalized shame and oppression. It is reported that many survivors do not even want to attend religious and cultural activities/ceremonies in their home and/or community because they have grown up with societal norms that are still rigidly engrained in their mind. For instance, one woman shared:

It is a sin for women to sleep with multiple partners and those who misconduct the values they are impure and thus God does not want to see them in His door and their participations in such sacred ceremonies may bring some bad results for their families.

Research, Publications, and the Media

Trafficking survivors were made more vulnerable when researchers/scholars and the media approached them for interviews and asked them to share their personal stories on trafficking. This study found that none of the survivors wanted to participate in anything that would push them to recall and recount their past, especially when they
are trying to move on from their past. One participant expressed her sadness about the researchers who had previously interviewed her:

_The first time when I was asked for interviews by one of the doctoral students . . . During the interview I felt like I was again in the same place that I escaped from [became emotional] . . . because of the questions they asked me. I hate the interview. I don’t understand what they do with the information collected from us. I neither saw them coming back to us after their interviews nor sharing their reports with us . . . This is my request for all researchers please do not come to us for interviews that increases our vulnerability and obviously this does not support our reintegration._

Survivors reported that participation in interviews increased their psychosocial trauma which did not facilitate reintegration. They women suggested that they want to be involved in a collaborative research that provides them with opportunities to work with researchers and promote their own personal and professional growth, not to make their already fragile morale even more brittle. For example, one survivor noted that

_You know my self-esteem and the level of confidence are really high now because I am not sharing the horrible stories with anyone- why would I do that? I want to live in present not in the past . . . So no more interviews please. We really meant it._

It was identified that some survivors did not feel confident enough to decline interviews, as they were afraid of, or beholden to, their managers or agencies who had the connections with conventional researchers and the media. Indeed, power differences and coercion could play a significant role in pushing survivors to be a reluctant part of research and/or publications. The study found that while participating in interviews, survivors were often pressured into answering each question by probing, even if they did not feel comfortable or safe in responding. The women were not opposed to research and publications; however, they did not want to be interviewed simply for the sake of interviews, and their commodification in trafficking should not be further replicated by academic and media commodification.

While addressing issues of trafficking, Nepal is using a “3Ps” anti-trafficking intervention model: prevention, prosecution, and protection grounded on the (Victims of Trafficking and Violence Protection Act 2000). For the purpose of this chapter, this section will primarily assess the area of protection; however, a brief overview of the other two themes is provided, as the areas of “3Ps” overlap and interconnect. However, although the “3Ps” overlap and are equally important, the major focus of anti-trafficking efforts in Nepal is based on prevention.

Preventative initiatives are dominated by two major approaches: a prohibitionist approach and a rights-based approach. The prohibitionist approach emphasizes the use of mechanisms to monitor strangers in communities and women who are leaving their communities and crossing borders (Bohl 2010; Sharma 2014). A number of prohibitionist programs have been introduced, especially in at-risk communities and at points along the Nepal-India border. These programs include the formation of village surveillance committees and the creation of monitoring groups to watch out
for the well-being of women who either run away or leave their community and cross borders (Bohl 2010; Chen and Marcovici 2003; Evans and Bhattarai 2000; Sharma 2014; Subedi 2009). A rights-based approach, on the other hand, is rooted in a framework based on the standards and foundations of international human rights. This approach emphasizes awareness-raising campaigns, funding for schools, and poverty alleviation strategies, including both capacity-building and employment opportunities. Awareness programs are also targeted at a wide range of audiences and stakeholders including police officials, village development committee officials, community residents and family members, and especially in at-risk communities (Chaulagain 2009; Evans and Bhattarai 2000; US Department of State 2016). Non-formal community education, such as street theater, folk song and dance performances, and vocational training in prevention homes, has been helpful in developing a popular understanding of a rights-based approach (Frederick et al. 2010; Pearson 2004; Samarasinghe and Burton 2007, Shakti Samuha 2013).

In terms of prosecution, the Government of Nepal has developed a number of anti-trafficking strategies through the establishment of laws and policies based in the imperatives of a number of human rights instruments, such as the Trafficking in Persons (TIP) 2000 and Victims of Trafficking Protection Act 2000, and international conventions such as the South Asian Association of Regional Convention and Convention on the Elimination of All Forms of Discrimination Against Women. As noted, the Constitution of Nepal 2015 promotes the rights of children and women and prohibits the trafficking of human beings – be it for slavery, serfdom, or forced labor of any form – and makes it punishable by law. The Human Trafficking Control Act 1986 proclaims that those involved in selling a human being, taking someone to a foreign country with the intention to sell or force them into prostitution, are liable to a maximum punishment of 20 years imprisonment and a minimum of 5 years. Recognizing that rehabilitation and reintegration were not addressed, and victims were not entitled to file an appeal under the Act, a Human Trafficking and Transportation Control Act 2007 was introduced with the provision of funding for rehabilitation and reintegration. By providing compensation to survivors, which shall not be less than one-half of the fine levied as a punishment to offenders, the government has tried to be more progressive to combat trafficking (McNeill 2008). However, in practice, the application of the above laws is sorely limited. For instance, parents who take their daughters to India and later sell them for prostitution are not prosecuted for trafficking under the code (McNeill 2008). Furthermore, the Human Trafficking and Transportation Control Act 2007 only criminalizes those involved in the selling, and not the purchasing, of human beings.

Despite these efforts, critics have claimed that, for a variety of reasons, Nepal is not successful in actually implementing the laws, initiatives, and policies (Acharya 2008; Dhungel 2017d; Dhungel et al. 2019; Locke 2010; McNeill 2008; Sharma 2014). For example, Human Trafficking and Transportation Control Act 2007 fails to provide neither clear and agreed-upon definition of reintegration nor a comprehensive reintegration strategy. This ambiguity makes it difficult for NGOs to develop consistent and effective programs for the reintegration of trafficked women. Additionally, limited law enforcement, police corruption, and the presence of reciprocal links between traffickers and law-enforcement authorities can cause difficulties in
both investigation and prosecution. The lengthy time involving the process of the Nepali criminal justice system allows trafﬁckers to leave the jurisdiction or change their identity. As a result, many trafﬁcked women do not ﬁle a case against trafﬁckers, seeing it as a futile exercise. Lastly, due to inadequate funding, some NGOs report difﬁculties in supporting victims who do report their cases. Although most grants coming from foreign governments and INGOs often go directly to the government for anti-trafﬁcking initiatives, the money often does not reach those for whom it is intended, due to the various manifestations of corruption (Acharya 2008; Adhikari 2011; Bohl 2010; Cameron and Newman 2008; Chaulagain 2009; Fisher 2008; Locke 2010; Simkhada 2008; Subedi 2009).

However, while greater emphasis on prosecution in Nepal would facilitate some measure of justice for victims, a focus on protecting and supporting survivors is necessary for successful reintegration. The United Nations Ofﬁce on Drugs and Crime (UNODC) (2008) has claimed that “where preventing trafﬁcking and rescuing trafﬁcked victims is a difﬁcult job in itself, rehabilitating them is even more difﬁcult because victims of trafﬁcking are often treated as social outcasts and suspects even by members of their own family” (p. 131). To support trafﬁcking survivors and their needs in reintegration, a number of multipronged US services and programs have been developed. With the intent of supporting survivors in reintegration, a number of different programs and services are being offered, and they will be discussed in the following section.

**Rehabilitative Centers**

Most survivors after being rescued from brothels spend some time in rehabilitation centers, ﬁnanced by the government and INGOs (Adhikari 2011; Dhungel 2017d; GoN 2013; Hennink and Simkhada 2004; McNeill 2008; Samuha 2013). Rehabilitative centers play a signiﬁcant role in comprehensive efforts to address human trafﬁcking, especially of women and children (Dhungel 2017d). The goal of the centers is “to prepare victims, through psychosocial care, education, vocational training, and legal services, for their eventual reintegration into either their home community, if appropriate, or into a new community” (USAID 2009, p. 16). Since 2010, the Ministry of Women, Children, and Social Welfare has been offering ﬁnancial support to eight rehabilitation centers, which are being operated by NGOs, such as Maiti Nepal and Shakti Samuha (Dhungel 2017d). Locke (2010) reported that some centers allow parents of survivors under the age of 16 to visit the centers, and this provide an opportunity to assess the family’s income and the level of support they are willing and able to provide the child. Once the centers go through the process of family identiﬁcation, a report is submitted to the Women, Children, and Social Welfare Committee on whether the children can go home or not. Depending upon available resources, some NGOs ﬁrst visit and revisit survivors’ family and community to educate them about trafﬁcking situations, and convince them to accept the survivors, and make arrangements for them to return home with some ﬁnancial support to help them to be involved in some small livelihood activities such as animal husbandry or tailoring (Evans and Bhattarai 2000).
Counselling/Medical Care Services

Most trafficking survivors commonly experience severe physical and psychological trauma after being trafficked (Dhungel 2017d). By recognizing the need for psycho-social support and counselling, many rehabilitation centers provide support not only to help people recover from their trauma but also rebuild their self-confidence (Adhikari 2011; Chaulagain 2009; Dhungel 2017d; Sharma 2014). Tzvetkova (2002) suggested that “counselling centers provide a safe and supportive environment for survivors where they can share their experiences and receive non-judgmental support and understanding” (p. 62). Many centers have adopted a more holistic healing approach as a new integrative model of reintegration. This includes peer support, mentoring, and experiential therapies, such as dance and theater, play, and recreation (Adhikari 2011; The Asia Foundation 2005).

Educational and Vocational Training

Most trafficking survivors in centers are provided with literacy classes and vocational and skills building training to help promote economic independence and self-esteem. These include basic life skills development, such cooking and food preparation techniques, sewing and weaving, together with handicraft making (Buet et al. 2012; Chen and Marcovici 2003; Dhungel 2017d; Frederick 2005; GoN 2013; Samuha 2013; Sharma 2014). However, general training, based on vocational skills development (such as candle making, sewing, and knitting), offered at rehabilitation centers is identified as a significant obstacle to successful reintegration, as it does not provide survivors with the actual marketable skills necessary for sustainable economic independence (Chen and Marcovici 2003; Dhungel 2017d; Evans and Bhattarai 2000; Sharma 2014). Building upon this recognition, however, some NGOs have provided microloans to survivors so that they can run small businesses such as grocery shops and tea shops, with the aims of establishing independent and economically viable lives in their communities (Adhikari 2011; Shakti Samuha 2013).

Stigmatization Prevention

Women are often doubly victimized in the rehabilitation and reintegration process after returning from brothels. Trafficking survivors experience social exclusion and ostracism when they return to their previous communities (Dhungel 2017c, d). Therefore, efforts to prevent the stigma attached to trafficking survivors are essential. Recognizing the need to prevent this stigmatization, UN agencies and NGOs have reinforced the requirement that efforts addressing stigma be a core component of trafficking awareness-raising campaigns, with varying degrees of success at the grass roots, family, and community level (Dhungel 2017d). However, most awareness-raising programs are offered primarily to local populations through workshops, campaigns, and education, and not to government officials and attorneys, who also
need a more complete and critical understanding of gender discriminatory practices and the subjectively constructed experiences of trafficking survivors (McNeill 2008; Dhungel 2017d). These initiatives, well intentioned as they are, do not adequately address the multiple issues associated with reintegration. Furthermore, raising awareness through posters, flyers, and media is not always an effective prevention tool, especially for those girls and women who are uneducated, illiterate, and economically marginalized. Alternative and more interactive activities such as door knocking, community interactions, and street dramas could be promising practices to augment these approaches, particularly in rural areas.

In dealing with reintegration, the “victim-centered” approach such as counselling and vocational training seems to be predesigned and generalized under a one-size-fits-all model and does not adequately address the specific and subjective issues of reintegration. For instance, those who want professional training in areas such as health care and hotel management, as opposed to vocational training, are not provided with these opportunities. Once again, this limits future economic opportunities for the women and their families. Adhikari (2011) argued that “it is important for NGOs to strengthen their strategies to facilitate in economically empowering and independent living of the trafficked women returnees” (p. 83).

The limitations of anti-trafficking efforts highlighted the fact that survivors were still experiencing challenges in reintegration and did not feel they were successfully reintegrated into society. Indeed, the term “reintegration” is perceived differently by agencies working in anti-trafficking efforts, the government, and by survivors themselves. To elaborate, the programs and services discussed earlier are neither rights-based nor person-centered, and a one-size-fits-all model does not meet the aspirations of survivors as individuals. This is possibly one of the reasons that the US Department of State (US Department of State 2018) placed Nepal in the tier 2 rank of countries due to noncompliance with minimum standards of Trafficking in Persons protocol.

**Unpacking and Reconceptualizing Successful Reintegration**

The following section explores the term successful reintegration from the survivors’ standpoint and what that actually meant to them. In order to aggregate trafficking survivors’ insights on the meaning of successful reintegration in the same manner as shared in group and in individual interviews, the Onion method as an analytical tool was used. The Onion method has previously been used as a tool to understand the dynamics at play in context of conflict (Ardón n.d.; Best 2006; Prah and Yeboah 2011). The Onion method speaks to three layers of knowledge including needs (what we need), interest (what we want), and position (what we say what we want) (Conflict Analysis Tools n.d.; Prah and Yeboah 2011). The process is “based on a metaphor of an onion whose layers are gradually peeled back, first those that area readily visible, then the hidden protected inner section. This tool helps uncover the hidden elements that are at the core of resolving a conflict-people’s deeply felt needs” (Ardón n.d., p. 6).
The original terminology used for the layers to centralize the self-empowerment of the co-researchers was modified by the researcher (Dhungel 2017d). For instance, the “needs,” “interest,” and “position” layers were renamed “human rights,” “environment,” and “demands,” respectively. Figure 2 depicts how survivors themselves defined their reintegration. For example, the outer layer of the onion is labeled “demands,” and it refers to what survivors say they want in terms of the specifics

![Figure 2](image-url)  

**Fig. 2** A comprehensive analysis of successful reintegration, adapted from Dhungel 2017d, p. 338
of their reintegration. The middle layer, “environment,” refers to what the survivors wish to achieve in their reintegration. Finally, the core of the onion is labeled “human rights” to better express that these are elements women need to have in place in order to be fully reintegrated into the society and that these needs are congruent with basic inalienable human rights. Overall, these layers authentically reflect the inner strength and realities of trafficking survivors and clarify what successful reintegration actually means to them. Indeed, the Onion method captures the complexity of survivors’ experiences and clearly calls for change in an accessible way that can help others understand how they can support survivors in their pursuit of successful reintegration.

Reconceptualizing “Successful” Reintegration

While constructing successful reintegration, based on the Onion method, reintegration as defined by co-researchers was seen as:

Reintegration is a reconstructing phase of the post-incident period of trafficking. In this phase, trafficking survivors attempt to forget and wash away all the bad memories that they carry over from their journey, which range from childhood to adulthood (from village to India). Therefore, incidents of trafficking should be perceived as accidents. Accidents happen to people, and people can then recover from them and move on. These kinds of accidents should not stop survivors from moving forward and enjoying their lives. Sadly, this cruel society does not support survivors to forget what has happened to them and move on with their lives. For trafficking survivors, reintegration is an essence, a never-ending process, a feat that extends far beyond the programs and services offered to survivors. Reintegration of survivors is not limited to the social, economic, physical and psychologically well equipped. The term reintegration cannot be simply defined in one or two sentences. Therefore, it is important that the broadest reach of the public learn what successful reintegration means to survivors and what needs to be done for their reintegration.

Overall, then, an integrative definition of “successful” reintegration is as follows: Reintegration is a process and a state of being that promotes a survivor’s right to choose a community to live in and a livelihood based on her aspirations. Reintegration is a process that centralizes the engagement and leadership of a survivor in developing reintegration laws, policies, and programs. Reintegration is a position that secures a survivor’s right to live with respect and dignity. Reintegration is an entitlement of a survivor to be included socially, culturally, politically, and economically. Reintegration is a welcoming, safe, and an inclusive environment that provides a survivor opportunity to enjoy her life and free from being doubly victimized and violence and ongoing stigma.

Conclusion

Every person should be treated with respect and dignity. However, reintegration is intertwined with multilayered systems and expressions of social injustice, economic disparity, and gender violence, and the much-needed response must take all of these
unsavory dimensions into account. Therefore, it is essential to critically and bravely address the structural forces that challenge a rights-based, participatory, and transformative approach. This is a core element in the creation of a counter-hegemonic movement. It is also important to develop reintegration laws/policies grounded in the survivors’ experiences, with an emphasis on the effective implementation of both existing and new laws and policies. Finally, it is critical to focus on the aspirations of survivors and to develop programs based on the positivity of their aspirations and hopes instead of focusing solely on the deficits of need. While emphasizing practices and research, advancing advocacy and educational campaigns to raise awareness of reintegration issues is also a fundamental aspect of transformative social change. The creation of a positive and safe environment for survivors to live with respect and dignity is essential. Therefore, it is suggested that anti-oppressive practice and a community-based participatory research process are essential for the meaningful and effective engagement of survivors. Additionally, the point needs to be emphasized that researchers and the media must be aware of the fact that survivors are not interested in participating in research simply as objects or interesting facts and sharing their past which makes them doubly victimized. It is important for researchers and the media to develop interview guides – and an ethic – that promote the resiliency and personal transformation of survivors. Overall, it is critical for all parties and stakeholders, in their common humanity, to explore new and, potentially, liberatory and emancipatory ways to address the reintegration issues of survivors and promote the transformative imperative. In sum, social change requires active work and intervention at the individual, community, state, and policy level.

Moving forward, application of an emerging reintegration practice model is recommended to address the manifold issues experienced by trafficking survivors. The use of such a model could help the Government of Nepal and agencies better understand the need for coordination and collaboration with other parties, including survivors, their families, communities, and academia, and to clarify their roles and responsibilities in addressing the wide range of reintegration issues (Dhungel et al. 2019).

The model can be implemented at two different, yet interconnected and mutually influential, levels: the policy level and the practice/research level. The policy level focuses on the need to engage and involve different actors in developing national and international responses to trafficking and reintegration. It is fundamental, however, in this policy process to recognize survivors’ positions and lived experiences, to engage survivors and other stakeholders in the process of knowledge construction, and, flowing from this, to contribute to the development and implementation of much needed national and international laws and policies (Dhungel 2017d).

The practice and research level proposes the need to democratically engage a wide range of stakeholders, including practitioners, academia, and survivors, in the collective and generation of knowledge and implementing the policies/programs/framework that are collaboratively developed. In summary, all stakeholders and communities must come together as allies and work with survivors so that they can learn from their unique and powerful experiences and gain a critical understanding of how the cycle of intersectional oppression operates and endures, despite the
periodic attention of well-meaning “experts.” Overall, an evolving and tentative process of sustainable collaboration is an effective way to disrupt these cycles of injustice and build a new society that promotes the rights of survivors, holds traffickers to account, and decreases the opportunities for trafficking. It is a way to further the wonderful potential of our common humanity.

enslaved around the word, it has also been criticized to be subjective and lacks measurable goals and associated indicators to evaluate the overall effectiveness of the countries’ efforts to combat human trafficking.

This chapter is written with an attempt to help the countries worldwide to have another way to evaluate the quality of their responses to human trafficking, especially that of anti-trafficking policies and programs. The paper presents a comprehensive anti-trafficking evaluation framework that consists of three layers: first is the technical evaluation of anti-trafficking interventions scenario and its impacts that lie in the 4-P evaluation (prevention, protection, prosecution, and partnerships); second is the gender-sensitive evaluation of anti-trafficking polices using three main gender-sensitive evaluation criteria including participation, empowerment, and accountability; and third is the analysis of gender construction of anti-trafficking policies. While technical evaluation has its own limitations in evaluating policy, this combined framework of both technical and gender dimensions will have to evaluate anti-trafficking policies from different angles to increase the countries’ capabilities to better tackle the transnational and organized crime like human trafficking.

Human trafficking · Gender framework · Evaluation · Anti-trafficking policies · Programs

Human trafficking is one of the most tragic human rights issues of our time. It splinters families, distorts global markets, undermines the rule of law, and spurs other transnational criminal activity. It threatens public safety and national security. But worst of all, the crime robs human beings of their freedom and their dignity. That’s why we must pursue an end to the scourge of human trafficking (the foreword by Rex W. Tillerson – Secretary of State in the Trafficking in Persons Report of US Department of State – USDOS 2017).

The scale of human trafficking is atrocious. The silence that conceals this crime is disgraceful. We have to speak out because the victims are living in fear for their lives. We have to raise our voices for them. That means confronting the social and economic conditions that abet this crime. It means arresting the traffickers. And above all, it means protecting the victims (former United Nations Secretary General Ban Ki-moon, as cited in USDOS 2017).

**Introduction**

Human trafficking is a transnational organized crime and has become a matter of great importance for countries worldwide, not only because it is one of the fastest growing crimes – which one dehumanizes and erodes human dignity (Getu 2006; Truong 2014; Duong and Simon-Kumar 2017) – but also because it involves different countries, different regions, and different continents. Although primarily an issue of human rights, human trafficking is also a socioeconomic and political
issue that relates to gender and discrimination and gender inequality. The dramatic increase in human interactions throughout the globe and the improvement of transportation networks and technology in the process of globalization, international integration, and especially in the Fourth Industrial Revolution have also contributed to the expansion of human trafficking. In other words, human trafficking can be seen as a dark side of the development process.

Virtually no country is immune whether as a country of origin, as a destination country, or as a transit country for victims of human trafficking. Human trafficking is an issue of concern for every country (World Vision Australia 2012). Therefore, combating human trafficking has become a strong political commitment for many countries. In 2013, the 'Human Trafficking in Persons Report' of the US Department of State (hereafter called TIP Report) calls for the elimination of trafficking as a foreign policy priority and for countries worldwide to fight human trafficking wherever it exists (USDOS 2013).

Measuring the efforts of countries worldwide against human trafficking crime, however, is a challenge. Recently, the most reliable assessment of responses to human trafficking of the countries worldwide is the TIP Report issued annually by the US Department of State. While the United States highlights the power of the Report with its credibility and accuracy that helps a lot of trafficking victims enslaved around the world, it has also been criticized to be subjective and lack of measurable goals and associated indicators to evaluate the overall effectiveness of the countries’ efforts to combat human trafficking.

This chapter is written with an attempt to help the countries worldwide to find out an additional tool to evaluate the quality of their responses to human trafficking, especially that of anti-trafficking policies and programs. The paper presents a comprehensive anti-trafficking evaluation framework that consists of three layers: first is the technical evaluation of anti-trafficking interventions scenario and its impacts that lie in the 4-P evaluation (prevention, protection, prosecution, and partnerships); second is the gender-sensitive evaluation of anti-trafficking polices using three main gender-sensitive evaluation criteria including participation, empowerment, and accountability; and third is the analysis of gender construction of anti-trafficking policies. While technical evaluation has its own limitations in evaluating policy, this combined framework of both technical and gender dimensions will have to evaluate anti-trafficking policies from different angles to increase the countries’ capabilities to better tackle a transnational and organized crime like human trafficking.

The USDOS TIP Report and Measurement of National Anti-trafficking Efforts

It should be noted that the United States took the lead at the beginning of the twenty-first century in the fight against human trafficking with the efforts to compile annual Trafficking in Persons Report and the comprehensive anti-trafficking legislation known as the Trafficking Victims Protection Act of 2000 (the TVPA). The US
Department of State began monitoring trafficking in persons in 1994, when the issue began to be covered in the Department’s Annual Country Reports on Human Rights Practices. Originally, coverage focused on trafficking of women and girls for sexual purposes. Over the years, the understanding of the problem has broadened into different types of human trafficking.

Globally, the TIP Report of the US Department of State has been considered to be an official way to measure government efforts to address and ultimately eliminate human trafficking. Since its inception, it has become one of the most important ways the world judges the progress in the fight against human trafficking and a policy tool for international engagement to combat human trafficking. The report also analyzes the state of global slavery and ranking countries’ compliance with international humanitarian law. The first TIP Report was published in 2001. In the 2001 TIP Report, only 12 countries were named as Tier 1 countries. Forty-seven countries were listed under Tier 2, and 23 countries were placed in Tier 3. Sixteen years later, the scope of the 2017 TIP Report was more than double that of the 2001 TIP Report which provided narrative and ranking for 187 countries. Countries were placed into one of several tiers based on their respective governments’ level of effort to address human trafficking issue year-round, between April 1, 2016, and March 31 annually.

The TIP Report is a reflection of the US global leadership on human trafficking—a key human rights issue and the US principal diagnostic tool to assess government efforts across the three Ps of prosecution, protection, and prevention. The TIP Report is prepared using information from US embassies, government officials, non-governmental and international organizations, published reports, news articles, academic studies, research trips to every region of the world, and information submitted to the email address tipreport@state.gov. US missions overseas are dedicated to covering human trafficking issues year-round. Clearly, the United States assesses efforts of individual countries worldwide and imposes sanctions on those that do not fully comply with the minimum standards for the elimination of human trafficking set out in the Trafficking Victims Protection Act (TVPA) of 2000. It is clearly emphasized in the TVPA that the government of the country should prohibit severe forms of trafficking in persons and punish acts of such trafficking and for the knowing commission of any act of a severe form of trafficking in persons and should prescribe punishment that is sufficiently stringent to deter and that adequately reflects the heinous nature of the offense. Also, the government of the country should make serious and sustained efforts to eliminate severe forms of trafficking in persons.

The US assessment and sanctions are outlined in the annual TIP Report. The US Department of State places each country in the TIP Report onto one of four tiers, as mandated by the TVPA. This placement is based not on the size of the country’s problem but on the extent of governments’ efforts to meet the TVPA’s minimum standards for the elimination of human trafficking, which are generally consistent with the Palermo Protocol. The four tiers are Tier 1, Tier 2, Tier 2 Watch List (Tier 2 WL), and Tier 3. The country’s tier ranking is based on the government’s efforts to combat trafficking as measured against the TVPA minimum standards and compared to its efforts in the preceding year. The 3-P paradigm of prosecution, protection, and prevention sections of each country narrative describes how a government has or has not addressed the relevant TVPA minimum standards, during the reporting period.
It should be noted that a country is assigned to *Tier 1* if it fully meets the TVPA’s minimum standards for the elimination of trafficking. *Tier 2* includes countries in which the government is not fully in compliance but is making significant effort to do so. A country is located in *Tier 2 Watch List* if it includes countries attempting to come into compliance (as in Tier 2) but where trafficking is high or increasing. *Tier 3* is countries where the government is not in compliance and is making no significant effort to become so.

A country is never finished and must not stop with the job of fighting human trafficking. It is because human trafficking can happen to anyone, anywhere, and anytime and look different each time. While Tier 1 is the highest ranking, it does not mean that a country has no human trafficking problem or that it is doing enough to address the problem. Rather, a Tier 1 ranking indicates that a government has acknowledged the existence of human trafficking, has made efforts to address the problem, and meets the TVPA’s minimum standards. Each year, governments need to demonstrate appreciable progress in combating trafficking to maintain a Tier 1 ranking. Indeed, Tier 1 represents a responsibility rather than a reprieve. No tier ranking is permanent (USDOS 2017). Every country, including the United States and those on Tier 1, can do more to improve the situation. All countries must maintain and continually increase efforts to combat trafficking. It should be noted that Tier 1 countries only meet the minimum standards to address trafficking, which is why the TIP Report offers recommendations for Tier 1 countries as well as others.

The 2017 TIP Report assesses anti-trafficking in 187 countries and territories, including the United States, and emphasizes the need to hold traffickers accountable and prosecute them. In all, there were 21 downgrades, meaning a country moved down a level, and 27 upgrades compared to the 2016 TIP Report ranking.

Figure 1 illustrates tier replacement issued by the United States in 2017 for efforts of countries worldwide to counter human trafficking. The TIP Report 2017 shows that there are still 23 countries in the world under Tier 3, which make very little or no effort to counter human trafficking. Thus, only 19.2 percent of countries have achieved well in combating human trafficking. Specifically, most of the countries in Tier 1 are developed countries and are also destination countries for human trafficking, while most of the countries in the other tiers are developing countries and also source countries of trafficking. Among the rest, there are countries that ignore, or are blind to, the issue, especially the countries in Tier 3. Combating human trafficking, therefore, is unequal and unfinished battle in different countries, and there is also a gross inequality globally in available resources and efforts put into countering the crime.

So, who are accountable for the US sanction against Tier 3 countries? Along with the embarrassment of being listed on Tier 3, such countries are open to sanction by the US government. If a country is downgraded to Tier 3, it will become subject to restrictions on US assistance. Pursuant to the TVPA, governments of countries on Tier 3 may be subject to certain restrictions on assistance, whereby the US President may determine not to provide US government non-humanitarian, non-trade-related foreign assistance. In addition, the President may determine to withhold funding for government official or employee participation in educational and cultural exchange programs for certain Tier 3 countries.
Further, according to USDOS (2017), consistent with the TVPA, the US President may also determine to instruct the US Executive Director of each multilateral development bank and the International Monetary Fund (IMF) to vote against and use his or her best efforts to deny any loans or other uses of the institutions’ funds to a designated Tier 3 country for most purposes. Alternatively, the US President may waive application of the foregoing restrictions upon a determination that the provision to a Tier 3 country of such assistance would promote the purposes of the TVPA or is otherwise in the national interest of the United States. The TVPA also authorizes the US President to waive funding restrictions if necessary to avoid significant adverse effects on vulnerable populations, including women and children.

**Fig. 1** Tier placements for 187 countries worldwide in 2017

Criticisms Around the TIP Report

The TIP Report – as a mandate of the TVPA 2000 – has received different criticisms around its ranking and tier classification, despite the fact that it has different benefits. The TIP Report is an opportunity for top-tier countries to exchange best practices and build collaboration and for lower-tier countries to be incentivized to improve their trafficking regulations. It is also a crucial tool of diplomatic engagement that has encouraged foreign governments to elevate their own anti-trafficking efforts.

In terms of the shortcomings, it is complicated and difficult to follow the guidelines outlines in the TVPA, if not nearly impossible, with developing countries and poor countries with high levels of corruption. However, surprisingly, in fact, even states with high corruption also rank high in terms of human trafficking
compliance (Pendley 2012). Also, it is feasible that corrupt officials allow and profit from human trafficking by ignoring the crime and being compensated by traffickers. People, therefore, believe that some countries have received unjustly high ranks due to their diplomatic relationships and trade deals with the United States.

In her paper, Pendley (2012) also analyzes that gender inequality and the level of education also contribute to a state’s level of compliance with the TVPA. While the TVPA acknowledged the low position of women’s status in the society is a reason for a burgeoning of the trafficking industry, there is a lack of compliance in fighting trafficking in males. Specifically, economic interests drive the compliance. She even criticizes that the United States picks and chooses which countries to sanction, ignoring those that are strategically important to the United States (Pendley 2012, p. 20). According to the TVPA, as mentioned earlier, the worst ranked countries are subject to non-humanitarian, nontrade-related foreign assistance sanctions from the United States. However, all unilateral economic sanctions by the United States are subject to presidential waiver “based on a finding that certain circumstances exist, such as improved human rights conditions, ‘extraordinary circumstances’, or simply finding that waiver is in the US national security interests” (Hendrix 2010, p. 196).

The last reason to waive sanctions leave the United States some spaces and some liberties to choose which countries will suffer from sanctions and which will not. Other scholars call the TIP Report as political motivations that shape the placement of countries into different tiers, and indicators become social pressure in international relations (Kelley and Simmons 2015). Scholars have questioned the TIP Report’s credibility as a true measure of anti-trafficking efforts, suggesting at times that political factors distort its country assessments. Even, it is suspected that the TIP Report can be a form of US interference in their domestic affairs (Mattar 2003; Rosen 2017).

The US narratives and replacement of countries on different tiers can be seen as “ranking and shaming” approach (Mattar 2003). It is a symbolic exercise in public shaming. Along with the embarrassment of being listed on Tier 3 as an egregious violator, such countries are open to sanctions by the US government. A low ranking not only hurts a country’s reputation, it also may result in sanctions that limit access to aid from the United States, the IMF, and the World Bank. Some even call it “soft power” – the ability of the United States to influence behavior of others not by using its superior military or economic power but by setting standards, spreading information, and otherwise nudging countries to adopt its values, determinations, and policies (Mattar 2003; Kelley and Simmons 2015). It shows the power of the ones who rank others, and those who have power must be held accountable.

The TIP Report has been criticized for poor data performance and lack of efforts to improve the situation. Only 66,500 victims were identified and helped globally last year according to the law enforcement data published in the 2017 TIP Report (USDOS 2017). The Global Slavery Index of 2016 shows that this figure represents less than 0.2% of the estimated 45.8 million slaves worldwide (Walk Free Foundation 2016). The TIP Report lacks an in-depth analysis of the root causes of slavery (Schartz 2017). Inconsistency in the US human trafficking figures has been criticized in the existing literature. Snajdr (2013) acknowledges that although TIP reports have
been considered as a master source of data, inconsistency can be found in the master narratives. He provides evidence for this claim. For instance, in the 2002 TIP Report, the estimate was 4 million victims globally; in the 2003 TIP Report, the estimate was incredibly lower – between 700,000 and 900,000 victims. The 2004 TIP Report showed that between 600,000 and 800,000 people were trafficked annually; in the same report, the estimate for the United States also fell from 50,000 in 2002 to 17,000 in 2004 (Snajdr 2013). Since then, few definitive annual numbers for human trafficking are given in the TIP reports. Again, in 2013 the newer figure provided in the TIP reports continues to confuse and alarm people with an estimated number of 27 million people being trafficked (USDOS 2013). In the 2014 TIP Report, John F. Kerry – the Secretary of State – reaffirmed that in 2013, there had been 44,000 survivors identified and more than 20 million others had been unidentified (USDOS 2014).

Also, the lack of research, both quantitative and qualitative, makes the report not extensive enough to eliminate modern slavery. It is clear that without a true understanding of the nature of modern slavery, the problem will be impossible to successfully fight.

Weiss (2012) argues that the USDOS must take major changes to the TIP Report’s methodology of ranking by modifying its standards and tailoring its analysis to each country’s specific situation. Further, the TIP Report’s analysis must be clear to all readers and supported by evidences and isolated from the political and economic concerns of the United States. On the other hand, the TIP Report must be a valuable tool that accurately reflects international efforts to combat human trafficking. The United States, therefore, needs to increase transparency in the TIP Report ranking process. Equal judgment will enhance the countries’ efforts and collaboration in tackling human trafficking crime and ensure that countries are making current efforts to eliminate the crime, not only promise to do so in the future. Without collaboration from the international community, many people will continue to be exploited across the globe. Further, a tier ranking should focus on protecting vulnerable lives – lives destroyed or saved by the on-the-ground impact of a government’s inaction or action (Smith 2016).

The above analysis shows that, there is a lack of comprehensive analysis to assess the countries’ efforts to combat human trafficking. The following multilayer framework may aid in the evaluation of national anti-trafficking policies and programs which act as a solid backdrop for the assessment of anti-trafficking efforts of government worldwide.

**Descriptions of Multilayer Framework to Evaluate Anti-trafficking Policies and Programs**

Anti-trafficking is clearly a political issue which reveals the state’s ideologies and commitments. Additionally, it is a gender-sensitive issue, as it impacts strongly on women and girls and less so on men and boys. To successfully evaluate anti-trafficking policies or programs, there is a need to have a comprehensive framework
that covers not only technical but also political and gender dimensions. My methodological contribution, in this chapter, is to develop such a multilayer framework, which I hope will contribute to policy evaluation practices.

My approach to policy evaluation in this chapter is drawn from two main methodological sources: the gender-responsive and rights-based approach for policy evaluation developed by the UNIFEM (Corner 2008) and Fischer’s (1995) policy evaluation framework. The UNIFEM approach asserts that gender equality and gender responsiveness are crucially important to help women achieve their human rights. In general, women have different roles from men; therefore they have different needs, priorities, and specific rights. To evaluate a gender policy, gender-sensitive analysis of the policy’s goals and achievements is appropriate and necessary, because the lack of a gender-responsive and rights-based approach contributes to slow progress and poor outcomes for women (Corner 2008). The integration of the UNIFEM gender-responsive and rights-based approach and Fischer’s two-order evaluation method forms a multidimensional evaluation framework which aids the analysis of anti-trafficking achievements and failures in terms of the fulfillment of its objectives, the gender implications of the policies, and the construction of human trafficking and trafficking victims’ identities. In short, it is an integrated framework that addresses global transitions in the country’s socioeconomic context, reveals the patriarchal normative values that undermine the state’s responses to human trafficking, and examines policy integration and goal realization.

This multilayer framework of policy evaluation has both technical and gender dimensions. The former is a fundamental level of analysis concerning the policy program and its participants. This micro-level of policy evaluation aims to tease out the empirical impacts of anti-trafficking policies and programs on women’s empowerment which, in turn, helps improve women’s status and reduce their vulnerability to human trafficking. The latter is a more abstract level of evaluation which turns to ideological and value concerns and investigates the relationship of policy goals to gender equality and women’s empowerment. This macro-level of policy evaluation aims at uncovering the ideological commitments of the state in the policies and programs that may create particular social values and contribute to the development of women’s progress in particular ways. In both dimensions, critical analysis is used to tease out the empirical and ideological contributions of the program and to reveal the underlying values and ideologies that govern the decision-making process and form the state’s responses to the human trafficking issue.

Accordingly, the evaluation of anti-trafficking policies and programs is undertaken at several levels: to ascertain whether the policy empirically fulfilled its stated objectives and to identify underlying non-gendered and gendered values that hampered the success of the policy program and their implications for women. The first layer examines aspects of a “technical” evaluation; these refer to process and outcome elements of the policy program. It serves the role of an indirect gender analysis to look at both men and women and their involvement in different policy processes. Technical evaluation section consists of an evaluation of anti-trafficking policy based on the 3-P anti-trafficking framework of prevention, protection, and prosecution and an additional important P (partnerships) as part of sophisticated
response to human trafficking. The gender evaluation section offers gender analysis of the policy program, including the values and identity construction underpinning the policy framework (Fig. 2).

**Section 1: Technical Evaluation of Anti-Trafficking Policies and Programs**

**Evaluation of the First P: Prevention of Trafficking Under the Policy**

It is said that “prevention is better than cure.” This notion is even more appropriate and proactive in the case of human trafficking because protection (including rehabilitation) and prosecution are interventions that only arise after trafficking cases have occurred (Nair and Sen 2005). Good prevention of trafficking helps reduce situations of vulnerability that challenge people’s safety and development and, in turn, contributes to saving the time and resources spent on receiving and
reintegrating trafficking survivors into the community, as well as on investigating and convicting traffickers. Additionally, effective protection and prosecution contributes to good prevention. The efforts to strengthen law enforcement and protection practices are important to ensure a stronger prevention strategy and to surmount challenges in the fight against trafficking. Thus, prevention must be placed at the center of intervention efforts to ensure that it becomes the focus and priority of any antihuman trafficking strategy. Also, as Shinkle (2007) argues, prevention is the most long-term intervention for reducing or eliminating trafficking because it helps avert the exploitation of vulnerable people: women, men, boys, and girls. Prevention strategies vary in different countries. In some, prevention includes economic empowerment, legal intervention, advocacy and awareness raising, and efforts to tackle demand for the labor or services of trafficked persons (Commonwealth Secretariat 2002). In other countries, prevention covers supply-based measures, demand-based measures, and solutions to reduce the financial gains of perpetrators (Shinkle 2007) or education, capacity building, and empowerment of the most vulnerable groups. In some countries, prevention is a main focus of the antihuman trafficking strategy, with particular attention given to awareness raising (Duong 2014); in other countries protection is the focus following the victim-centered approach (Andreatta 2015). In this section of evaluation, main characteristics of prevention activities of the policy program must be analyzed, along with the analysis of gaps and challenges of the policy prevention activities.

**Evaluation of the Second P: Protection of Trafficking Victims**

Protection of victims of trafficking refers to the efforts that seek to provide appropriate assistance and services to trafficking survivors to maximize their opportunity for a comprehensive recovery (USDOS 2012). Worldwide, different frameworks to protect victims of trafficking are adopted. Among those, the two most popular are the human rights approach and the criminal justice approach. The human rights framework aims to meet the specific needs of the victims of human rights violations (Wuiling 2006), while the criminal justice framework focuses on providing victims with a safe environment and ensuring their rights are upheld during criminal proceedings (Jorge-Birol 2008). These frameworks are used either separately or in a combination of human rights and criminal justice. Raffaelli (2009) acknowledges that European countries apply the criminal justice solution to protect trafficked victims; however, at the same time, victims are supplied with secured accommodation, psychological and material support, and assistance for their children. In some cases, the protection of trafficked victims targets trafficking survivors using the human rights approach to help them stabilize their lives, seek jobs, and reintegrate into the community (Duong 2014).

In the countries, where victim-centered approach is applied, protection of trafficking victims can be the main pillar of anti-trafficking framework. The Recommended Principles on Human Rights and Human Trafficking (UNHCHR 2002) acknowledges that violations of human rights are both a cause and a
The human rights of trafficked victims must be placed at the center of all antihuman trafficking strategies to protect, assist, and provide support to victims to overcome the difficulties that make them vulnerable. The UN Trafficking Protocol of 2000, which offers overall guidance for nation-states worldwide to set up principles and laws to combat human trafficking, emphasizes that antihuman trafficking activities must be targeted at protecting and assisting the victims of trafficking with full respect for their human rights, and all antihuman trafficking activities must pay particular attention to women and children. More concretely, the TVPA of 2000 calls for special support to trafficking victims because they are vulnerable and frequently have limited access to legal knowledge and information; they thus often find it difficult to report the crime or assist the authorities in the investigation and prosecution of perpetrators. The Act confirms that nation-states worldwide have to focus on protecting victims of trafficking, rather than punishing them or adversely affecting their lives and progress.

In this section of “protection,” efforts evaluation, mechanism to support victims, support provided by government and civil society, as well as gaps and challenges in the protection area are the focus.

**Evaluation of the Third P: Prosecution of Traffickers**

Prosecution is necessary to help eliminate human trafficking. Effective prosecution is of great importance because it ensures there are penalties for traffickers and helps attain justice for victims of trafficking (Gallagher and Karlebach 2011). Overbaugh (2009) emphasizes that criminal prosecution is critical in order to combat human trafficking, because it deters further trafficking, incapacitates traffickers, and protects trafficking victims by removing them from immediate danger and averting further possible exploitation or harm. Prosecution has become more essential as it is one of the more measurable and integral criteria of anti-trafficking efforts but is somewhat overemphasized by the United States in its annual TIP reports (Wang 2005), where it is being used to judge and sanction countries which have not complied with the minimum requirements of the TVPA. More specifically, breaking trafficking chains and prosecuting traffickers also help discover and reduce the other types of organized crime (such as drugs and weapons trading or smuggling of migrants), while those crimes and human 149 trafficking have a close link to each other. According to Picarelli (2009), major international organized crime groups are perpetrators of trafficking in human beings as well.

Despite the great importance of criminal prosecution of traffickers, the rate of prosecution for trafficking offenses globally is still very low. Of course, the reported number of prosecuted cases does not reflect the huge number of people living under different types of exploitation worldwide, although exploitation is not always the same thing as human trafficking. The prosecution of traffickers is a difficult task, especially for developing countries, because it requires different resources and skills to cope with organized and shadowy human trafficking chains. While much research and effort has been spent on prevention of trafficking and protection of trafficked
victims, there has been limited research on the practice and experience of trafficking prosecution and on the relationship between prosecution and the other two Ps. According to David (2008), there appear to have been few studies that have sought to systematically examine issues such as who is being prosecuted, how these cases are being prosecuted, and so on. David (2008) argues that this lack of research on prosecution of trafficking crime can be explained by the complexity of the crime, and perhaps difficulties accessing relevant data, especially primary data such as trial observations, interviews with prosecutors and defense lawyers, and trafficked persons who give evidence in court.

Although in most countries worldwide prosecution is the third P of a basic anti-trafficking paradigm, actions toward prosecution of traffickers are different in different countries. In India, prosecution focuses on bringing traffickers to court, confiscating illegal assets of traffickers resulting from trafficking crime, and forcing traffickers to compensate for the damages done to victims (Lazarsfeld and Rosenberg 2004). In New Zealand, the Plan of Action to Prevent People Trafficking issued by the Government of New Zealand defines prosecution to be the act covering investigation of suspected trafficking activities, support for victims of trafficking during the criminal justice process, and compensation for victims of trafficking. The penalty for this crime is up to 20 years in prison and/or a NZD500,000 fine (Government of New Zealand 2009). Prosecution of traffickers in Vietnam focuses more on investigation of trafficking cases, arresting and punishing traffickers, while compensation schemes for victims and support for them during and after investigation and prosecution have not been sufficiently paid attention to Duong (2014).

The evaluation of the third P of the trafficking paradigm identifies whether the policy program is a crime-control approach, or trafficker-centered or otherwise, with focus in the analysis and evaluation of prosecution activities and points out challenges and gaps that the government faces in prosecution activities.

**Evaluation of the Fourth P: Prosecution of Traffickers**

This chapter highlights the importance of partnership in combating human trafficking, although partnership has not been officially added to the anti-trafficking paradigm. Up to 2017, the US Department of State still maintains the assessment of the countries’ efforts to push back human trafficking based on the three main parameters of prevention, protection, and prosecution. However, the US Department of State continuously emphasizes partnership as a powerful tool that accelerates the success of any anti-trafficking interventions and emphasizes that the interlocking 3-P paradigm requires highly coordinated counter-trafficking responses and collaboration within and between local, central, and international government and communities (USDOS 2011, 2012, 2017).

Partnerships are important for combating trafficking because they accumulate strengths from different actors to address the crime and to provide victims with the freedom to move out of the slavery trap (USDOS 2010). On the one hand, they show coordination and cooperation between different actors; on the other hand, they
involve the expansion of the broad alliance of stakeholders to provide technical know-how and expertise to government and nongovernment organizations to address human trafficking challenges. Considered from the perspective of strong partnerships, countering human trafficking is everybody’s business and every country’s task; therefore, the stronger the network against trafficking, the weaker the criminal network is. Further, anti-trafficking can never be successful as a single program; it requires the coordination of different people, actors, and countries.

It is evident that partnership promotes gender equality to counter trafficking. While gender inequality is a cause and also a consequence of human trafficking (Kelley and Simmons 2015; Duong 2014), partnerships can be an effective means of promoting gender equality and women’s empowerment by bringing greater attention to the need of ensuring better linkages between gender equality and the promotion of sustainable development. Further, actions at the grassroots level can be better facilitated through a network of partnerships working toward common objectives and outcomes. Through involvement in policy networks, men, women, state, and non-state actors learn from each other’s experiences and benefit from a wide pool of knowledge, skills, and contacts.

There is no doubt that dealing with the complexity of human trafficking crime always requires a strong partnership with a substantive ethical content, in which there is a high level of trust among partners, a respect for partners, and the elimination of any existing boundaries to ensure a common voice and common goals to work toward. In this partnership, discussion of rights and obligations must be a central concern. Similarly, accountability and confidentiality need to be taken into account in partnerships to ensure that all partners can contribute to the achievement of common goals but still preserve their own professional identities.

Recently, countries worldwide have tended to highlight and promote partnerships in countering human trafficking crime. Assuming to be the leader of international anti-trafficking scourge, the United States asserts that the fight against human trafficking is one of the great human rights causes of humankind, and the United States continues to lead the fight in partnership with people and countries worldwide. Building partnership is a necessary component of any successful anti-trafficking strategy (White House 2013). As part of the government’s longstanding commitment to protect the vulnerable, Canada has committed to strengthen the relationship with different stakeholders to facilitate the ongoing development of effective policies and tool and to ensure a comprehensive and coordinated approach (Government of Canada 2012).

It is meaningful to evaluate partnership efforts of the countries. In the one hand, the evaluation of partnership highlights the efforts of stakeholders involve in partnership activities. In the other hand, it points out the gaps and limitations in partnership that need to be improved. Knowledge and information of partnership, especially, in anti-trafficking area, are limited. Carnwell and Carson (2009) define four particular types of partnership: project, problem-oriented, ideological, and ethical. Project partnerships are time-limited for the duration of a particular program, while problem-oriented partnerships are formed to respond to a publicly identified problem and remain as long as the problem exists. Ideological partnerships affirm
certain viewpoints that are considered to be the correct way of seeing things. Ethical partnerships have a substantive ethical content in their mission and practice. Based on this suggestion, one may have some clues in defining evaluation criteria by identifying whether their government anti-trafficking partnership is ethical or problem-oriented.

Duong (2014) evaluates partnership efforts of the Vietnamese government to counter human trafficking with a focus on three dimensions: (1) multi-pillar partnership, vertical partnership between central and local government and horizontal relationship between the main state actors in charge of national anti-trafficking policy; (2) public-private partnership, partnership between different levels of government and NGOs and IGOs which operate in the anti-trafficking area; and (3) international partnership, partnership between the country with governments in the region and international.

Partnership evaluation is not simple because it involves different stakeholders, both nationally and internationally. It is also because partnerships are conducted based on compromise among partners with different sociopolitical aims and, therefore, are quite complex (Funnell, 2006). Further, it is a challenge to evaluate partnership and its impacts on particular groups within the population because partnerships are dynamic, multilevel, embedded in specific cultural and political movements, and responsive to those contexts (Butterfoss 2009). Partnership evaluation of anti-trafficking efforts is more difficult because human trafficking is a transnational organized crime that is hidden and difficult to be uncovered. Apart from the evaluation of different partnership dimensions, gaps and challenges in partnership should be identified.

Section 2: The Multi-pillar Gender-Sensitive Evaluation of Anti-trafficking Policies and Programs

Existing literature has emphasized the importance of gender evaluation of policy program. As Corner (2008, p. 7) noted, for policies and programs to be well designed and implemented, monitoring and evaluation must be gender-responsive and rights-based (Corner 2008, p. 7). For Fischer (1995), policy evaluation needs to target both micro- and macro-levels – the fundamental and the more abstract areas of policy impacts. This section of the policy framework focuses on the gender evaluation of policy processes (especially in terms of women’s participation and state’s accountability) and of policy outcomes (particularly, women’s empowerment) to both explore the state’s gender ideologies as manifested in the policy and to examine policy contribution to women’s empowerment. This section of framework also helps identify policy contribution to achieving greater gender equality and to the reduction of women’s vulnerability, especially that of trafficking returnees.

Although gender analysis has recently been widely incorporated in academic discussions of the human trafficking issue by different scholars (Heyzer 2006; Samarasinghe 2008), there has been little research that has integrated gender considerations into the evaluation of anti-trafficking policies worldwide. This section of
the gender evaluation framework is informed by the Gender Responsive and Rights-Based Approach (GRRA) initiated by D’Cunha (2002) and the UN network (UNIFEM 2002; Corner 2008) which highlights the importance of gender and human rights in addressing the trafficking issue. The GRRA emphasizes that anti-trafficking policy must focus on realizing and addressing the issues that hamper equal development opportunities for women and men, girls and boys. Gender and rights are two main perspectives used in the GRRA. This section of the framework, however, uses a gender-sensitive approach that encompasses both gender equality and human rights to undertake a gender analysis of the policy in terms of its processes and outcomes. This gender-sensitive approach, therefore, helps evaluate both the state’s and women’s efforts (women in the community and trafficked women) in addressing women’s vulnerabilities and in advancing gender equality.

Theoretically, policy should address gender inequality, but often does not as it too reflects dominant gender norms and values. Internationally, gender has not been an issue in international law and policy, and women are often being viewed as naturally inferior to men (Charlesworth 1989). Similarly, in international policy agendas, women are framed as the forgotten and the invisible (Waring 1989). This reality needs to be addressed, so that policy evaluation can become well-grounded in a gender-sensitive framework. Gender sensitivity, according to the World Bank (2005), helps reveal the extent to which a development program has addressed the different gendered needs of men and women or made an impact on their lives and the lives of others. Additionally, gender analysis not only entails different gender tools and approaches but also a structural analysis that utilizes one or more gender analysis frameworks to tease out different gender dimensions of the policy continuum. Further, to make development work for women, policy needs to be responsive to the discursive context in which gender issues are perceived and interpreted differently by policy stakeholders. In the case of anti-trafficking policy, the need for gender-sensitive evaluation is incontrovertible because human trafficking, clearly, reflects patriarchy and gender inequalities.

In this section of the gender evaluation framework, I look at gender within the institutional framework by examining the participation of women in the development of policy, the state accountability in responding to the needs of women and trafficked victims, and in terms of outcomes in empowering women. Such a Gender-Sensitive Evaluation Framework (GSEF) covers three evaluative dimensions: participation, accountability, and empowerment. The three chosen themes are distinct but interrelated dimensions of social relationships that are significant to the analysis of gender and social inequality. To better evaluate anti-trafficking, specific evaluation contents should be identified.

Participation and representation of women in anti-trafficking policy processes are meaningful in increasing women’s capability to protect themselves from human trafficking crime. The term “women’s participation” has been widely used in mainstream social science but with slightly different meanings. On the one hand, women’s participation is documented as women’s political representation in the political mainstream and in formal structures of governance (Rai 2002; Heyzer 2006) and as women’s inclusion in policy-making processes (Karl 1995; Corner 2008).
Elsewhere, it is discussed in terms of women’s involvement in collective action with other social actors. Women’s participation in any form brings about increased decision-making power for women and provides women with economic and empowerment benefits (World Economic Forum 2005; Oxfam 2013). The Beijing Platform of Action of 1995 highlighted the need to provide women with positions of power and raise women’s voices in decision-making processes. To facilitate this, the platform of action recommended that nation-states take measures to ensure women’s equal access and women’s full participation and inclusion in power structures and decision-making processes and to improve women’s capacity in order to increase women’s leadership to work for women and to ensure gender equality. Participation, therefore, not only promotes women’s representation in policy processes but also helps ensure that women’s interests are represented and translated into actual implementation. Women’s participation is important, because as Goetz and Baden (1997) indicate, greater participation by women helps change the characters of the institutions and better promote women’s empowerment in development. Women’s participation in policy processes can be further evaluated in relation to two main areas: women’s involvement in the various stages of the decision-making processes and collective participation of women and other social actors (men or NGOs) in anti-trafficking activities.

Gender accountability is the second pillar. Women, in the words of the UNIFEM (2008, p. 18), “must be the drivers of the accountability process” and accountability must work for women’s progress and gender equality. The accountability of the state derives from a rights-based approach to engendering policy and to providing institutional rights for women in development (D’Cunha 2002; Goetz and Baden 1997). In the words of Kardam (1997), gender accountability is the responsiveness to women’s interests and the incorporation of gender-sensitive policies, programs, and projects in state institutions (p. 44). Gender accountability, therefore, needs to ensure that women’s human rights are well represented and state institutions are gender sensitive when addressing development issues. Following this understanding of gender accountability, the state, as power holder or duty bearer, needs to deliver appropriate and knowledgeable institutional services in order to fulfill its obligation to its people, who are defined as rights-holders or service recipients, and people, especially women, need to be provided with favorable conditions to claim their rights (Corner 2008). In other words, strong accountability ensures women as rights-holders to make claims from the state as duty bearer.

Along with accountability is transparency. Accountability and transparency are generally regarded as core and interactive elements of good governance, and both link to sustainable development (UNIFEM 2008). The United Nations also asserts that good governance and human rights are mutually reinforcing (United Nations 2007). Without good governance, human rights cannot be respected and sustainably protected. The proposed evaluation framework takes into account a gender-responsive accountability perspective to analyze the state’s accountability in terms of women’s rights and gender equality. To trace the state’s accountability and its impact on women, this chapter turns around two main areas of analysis. The first is transparency in anti-trafficking politics – meaning, the degree to which anti-trafficking-related data and
information are widely available for public disclosure. The second is the state’s ability to create favorable conditions for women to achieve gender-based rights and to demand changes.

Women’s empowerment is the third pillar of gender-sensitive evaluation section. Development policy always has its own target group, and women’s empowerment is essential for any development effort (Kabeer 1994; Bayeh 2016). The Beijing Declaration and Platform of Action states that women’s empowerment is “fundamental for the achievement of equality, development and peace” (UN Women 1995, para. 13). While human trafficking is an issue of human rights which links to gender inequality and women’s vulnerabilities, empowerment is an important tool to help women craft their own brighter futures. Empowerment has been defined as the goal of development and intervention. Drawing on the work of Batliwala (1994) and Kabeer (1994) on empowerment, empowerment is both a process and an outcome. As a process, women’s empowerment challenges patriarchal relations, which lead to changes in men’s control over women. As an outcome, empowerment is the result of that development process. This evaluation traces empowerment as a policy outcome rather than a policy process. Accordingly, empowerment can be assessed by an improvement in women’s ability to act for change and to secure sustainable livelihoods as a way to prevent them from being trafficked.

Empowerment of women, as a policy outcome, therefore, in turn, enhances women’s capacity and overall well-being. Luttrell et al. (2009) acknowledge the emphasis on women’s empowerment as an outcome that always leads to a focus on economic empowerment and increasing women’s access to economic resources. Among different types of empowerment, economic empowerment can be one of the main criteria because it may help trafficking returnees overcome their difficulties and reintegrate into the community.

Section 3: Gender Construction Analysis of Policies and Programs

Tracing the gender construction of policy is an art of exploration, because knowledge in the policy world is an outcome of negotiation between those with political power, such as policy makers, and political elites and people who live in the everyday world (Ridgeway 2011). Policy analysts must know what people believe reality to be and uncover the underlying competing meanings of policy debates. Recognizing that policy is a social construct rather than a self-defining phenomenon, Fischer (2009) considers that policy analysis is a deliberative craft that “seeks to bring a wider range of contextually sensitive empirical and normative criteria to bear on the argument under investigation” (p. 125). Similarly, other scholars Ball (1993) and Loomba (1998) emphasize the analysis of policy as texts (focusing on the discursive dimension of policy, particularly in relation to policy texts) to discover how policy problems are framed within policy proposals and how those frames affect possibilities for policy actions. Believing that people construct reality, Bacchi (1999) highlights the constructivist perspective that helps uncover underlying norms and values in policy deliberation, rather than merely identifying the facts of policy
arguments. For Bacchi (1999), public policies are competing framings of problems, and there are social visions that lie behind those competing representations; therefore, an analysis of policy problems’ constructions is as important as examining whether the policy objectives are fulfilled.

The questions of how women are constructed in policy and how women perceive themselves have become a particular concern for the contemporary policy agenda. The terms associated with the constructivist perspective (e.g., framing, construction, negotiation, representation, and deliberation) are used regularly by feminists and policy analysts such as Fraser (1989), Bacchi (1999), and Fischer (1995, 2009). These theorists show that social constructions around gender play a significant role in “technical” responses to policy: firstly, issues that are women focused – like abortion, contraception, and sexuality – are heavily influenced by the values of the cultural milieu; secondly, women as subjects are not neutral citizens. They are constructed differently to men, either in terms of the different roles they play in society or their abilities and capacities. There is often not just one construction about gender, policy, and women but rather multiple, conflicting discourses. The analysis of gender construction of the policy employs the analysis of policy as texts and also examines the specific historical, institutional, and cultural contexts which produce particular discourses around human trafficking in specific countries. Thus, as Bosso (1994, p. 189) noted, policy makers who conceptualize and implement policy as agents are not completely free to construct or reconstruct discourses but rather are informed by their social and cultural contexts.

Human trafficking is a highly contested issue in public policy. The use of a gender constructionist perspective in analyzing anti-trafficking policy is suitable given that the analysis of policy problems’ construction helps reveal how policy problems are socially constituted, framed, and interpreted. The analysis of the gender construction of anti-trafficking policy offered in this chapter will center on three main discourses: a discourse of women’s vulnerability, a discourse of morality, and a discourse of stigma against women. The analysis helps identify the implications of those discourses for policy on human trafficking and, in turn, their implications for women. Deconstructing the policy highlights that there are multiple ways in which vulnerability is understood, leading to tensions and disconnections in conceptualizing and implementing the policy in practice. The second discourse relates to how policy makers construct morality, and this discourse is found in the overlap between trafficking and prostitution. The third discourse turns around the issue of stigma and discrimination against women and trafficked victims and argues that by eliminating stigma, the cycle of women’s vulnerability can be broken.

Conclusion

Evaluation of anti-trafficking policy is an essential tool and function of every government, not only because no country is immune to human trafficking, as noted earlier, but also because it points out strengths and weaknesses of policies and programs and organizations to improve their effectiveness. Evaluation of
anti-trafficking policy provides a useful and important tool to address the need for credible information, well-grounded decision-making, and governmental transparency. Human trafficking is a gender-based violence against women and they are more vulnerable to trafficking. Gender evaluation of anti-trafficking policy based on gender-responsive and rights-based approach and discourse analysis of the policy help uncover the underlying meanings and practices around policy implementation and other stages of policy cycles.

This chapter offers a multilayer gender evaluation framework to evaluate anti-trafficking policy and government efforts to counter human trafficking, given that the assessment of the US Department of State is still limited and unfair, as discussed above. The proposed framework consists of technical section covering the evaluation of 4-P (prevention, protection, prosecution, and partnership), while gender section provides gender-sensitive indicators to trace policy gender concerns and its gender implications for women. Further, it helps to tease out the underlying social and cultural factors informing the policy debates which inherently impact on the state’s efforts to address the gender concerns of anti-trafficking policy. Depending on evaluation purpose and the scope of evaluation, different criteria and discourses can be set and expanded. The different criteria and discourse are considered useful in different context. Further, the proposed framework can be applied in evaluating other sociopolitical policy, not only human trafficking. However, technical evaluation section needs to be modified with relevant criteria.

Abstract

The Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (Palermo Protocols) established an internationally agreed upon definition of the crime of “trafficking in persons” under its Article 3. By virtue of this definition, the crime of trafficking in persons is substantiated when an “act” (recruitment, transportation, transfer, harboring, or receipt of persons) is committed by way of a “means” (the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability, or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person) for a purpose of exploitation. This protocol is subject to its parent instrument, the United Nations Convention against Transnational Organized Crime (CTNOC). The

CTNOC notes that it extends to offenses which are transnational in nature and involve an organized criminal group. It, therefore, appears that the CTNOC imposes additional elements forming part of the crime of trafficking: that the offense be transnational in nature and involve an organized criminal group. Whether these are required elements is a discrepancy found throughout trafficking scholarship and has been identified as a point of unresolved contention. The lack of clarity regarding the definitional contours of this offense means that there is potential for issues in the investigation and prosecution of trafficking. In an effort to bring clarity to the constituent elements of trafficking, this contribution uses a textual analysis to show that, despite some language suggesting that trafficking is strictly a transnational organized crime, the codified definition is not limited to offenses which are transnational and nor does it require the involvement of an organized criminal group.

Introduction

The widespread international adoption of the United Nations Convention against Transnational Organized Crime (CTNOC) and its Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (Palermo Protocol) established the international legal framework with which to address the crime of “trafficking in persons.” As codified in its Article 3, the Palermo Protocol defines “trafficking in persons” as:

The recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs.

Article 3 enumerates three elements of this offense: the perpetration of (1) an “act” (recruitment, etc.) by the use of (2) a “means” (threat or use of force, etc.), for (3) the “purpose” of exploitation. The codification of the “act” and “means” elements are rather finite, while the third element is open to interpretation since the term “exploitation” is left undefined. Instead, Article 3 identifies several types of exploitation which “at a minimum” satisfy this element.

The Palermo Protocol is bound to the CTNOC as explicitly codified under its Article 1 which states that it “shall be interpreted together with” the CTNOC and that all of the CTNOC’s “provisions...shall apply, mutatis mutandis” to the Palermo Protocol “unless otherwise provided.” The CTNOC explicitly applies to offenses that are “transnational in nature” and “involve an organized criminal
group, conditions also articulated within the Palermo Protocol’s scope of application as indicated in its Article 4.

Considering the interplay between these instruments, the interpretation of the definitional construct of trafficking varies among scholars. For example, there are those who maintain that trafficking under international law is only trafficking per the Palermo Protocol when the conduct expressed in Article 3 is perpetrated by an “organized criminal group” and is “transnational in nature,” as suggested by the language of the CTNOC (Allain 2013: 353; Brand 2010: 24–26; Elliot 2015: 91; Hathaway 2008: 9). Alternatively, others conclude that “trafficking in persons” is exclusively comprised of the act, means, and purpose elements contained in Article 3 of the Palermo Protocol (Gallagher 2009: 812–813; Mattar 2013: 137; Roth 2012: 97). Whether the crime requires transnationality and involvement by an organized criminal group is thus a subject of confusion and conflict regarding the confines of the crime of trafficking and its application in practice.

This definitional issue is a legitimate cause for concern since most State Parties have implemented the Palermo Protocol’s construct (or language inspired by it) in their respective domestic laws criminalizing human trafficking (Gallagher 2010: 79). The extent of this legal uncertainty has already resulted in the publication of a UNODC Issue Paper on the links between organized criminal activity and the crimes of human trafficking and migrant smuggling. Additionally, the United Nations Working Group on Trafficking in Persons made a formal request for clarity on the role of “transnationality” concerning the trafficking offense. It also been raised in academic research discussing the interpretation of the Palermo Protocol (see Jansson 2014: 71; McClean 2007: 15). However, the definition, context, and/or scope of this crime beyond the confines of the Palermo Protocol’s Article 3 has not yet been exposed to deeper academic scrutiny. This chapter aims to provide that scrutiny and come to a clear conclusion regarding what the constituent elements of the offense of trafficking are as codified in the Palermo Protocol.

Firstly, this chapter will briefly discuss why clarification of the constituent elements of trafficking is important. Secondly, it will discuss the codification of transnational crimes under international law through the introduction of the CTNOCs and its Palermo Protocol. Thirdly, the definitional contours of the concepts of “transnationality” and “involvement of an organized criminal group” within these instruments are examined. Finally, the relevant articles within the CTNOC and Palermo Protocol contributing to the interpretational tension of elements of the crime of trafficking are analyzed. Based on a strict textual reading of the instrument, its preparatory works, the Commentary, and interpretation by countless UNODC publications, it is argued that transnationality and commission involving an organized criminal group are not constituent elements of the offense.

The Purpose of Clarification

The CTNOC and Palermo Protocol and their preparatory works produce conflicting interpretations because they appear to simultaneously require and reject transnationality and the involvement of organized crime groups as elements of the
construct of trafficking. This chapter clarifies the crime of trafficking in this regard by engaging in a textual analysis of these international instruments (see Hutchinson and Duncan 2012: 83). A textual analysis reveals how the interpretational conflict has arisen and offers a systematic approach to resolve the question. Orakhelashvili (2008: 286) explains that this process involves examining the instruments themselves, as well as their preparatory works and associated commentary, in order to “deduce the meaning exactly of what has been consented to and agreed.” This approach accords with Article 31 of the Vienna Convention on the Law of Treaties, which states “a treaty shall be interpreted in good faith in accordance with the ordinary meaning to be given to the terms of the treaty in their context and in light of its object and purpose.” This methodology reveals how “transnationality” and “organized crime” may be considered as elements of trafficking under international law.

The goal of this exercise is to aid in the harmonization of the legal interpretation of trafficking. This contribution aims to bring clarity to an understanding of the international definition of trafficking for governments who have implemented it in their domestic law and perhaps even for those using it in internationalized criminal courts and tribunals, should prosecutions of traffickers at this level eventuate (see Siller 2016).

The Codification of Transnational (Organized) Crimes Under International Law

Transnational criminal law is generally understood as a classification of offenses, codified via multilateral “crime suppression conventions,” but enforced and prosecuted within domestic systems under states’ respective domestic criminal laws (Boister 2012: 11–12). “Transnational crimes” are understood to “identify certain criminal phenomena transcending international borders, transgressing the laws of several states or having an impact on another country” (Boister 2012: 11–12). Specifically, Albanese (2012:2) categorizes transnational crimes according to at least one of three “broad objectives” including the following:

1. Provision of illicit goods (i.e., drug trafficking, stolen property, counterfeiting)
2. Provision of illicit services (i.e., human trafficking, cybercrime and fraud, commercial vices)
3. Infiltration of business or government (i.e., extortion and racketeering, money laundering, corruption)

International criminal law is said (Cassese 2013) to be distinguishable from transnational criminal law because the former is concerned primarily with addressing the so-called core crimes (genocide, war crimes, and crimes against humanity). While there are, of course, substantive and contextual differences between most international and transnational crimes, Boister (2012: 12) contends that the primary distinguishing feature is the manner in which these crimes can be addressed in practice (e.g., indirect for transnational and direct for international) (In the context of trafficking, however, this conclusion is not so clear, since “trafficking in persons”
has been inserted into the definition of “enslavement” as a crime against humanity in the Rome Statute of the International Criminal Court (see Siller 2016: 2).

Putting theory to practice as it concerns the codification of transnational criminal law was enabled by the efforts of the United Nations, which took an active role in facilitating international meetings, sponsoring conferences, and the establishing a commission during the 1990s (see McClean 2007: 2–3). Specifically, General Assembly Resolution 53/111 of 1998 decided to establish an open-ended intergovernmental ad hoc committee for the purpose of elaborating a comprehensive international convention against transnational organized crime and of discussing the elaboration, as appropriate, of international instruments addressing trafficking in firearms, their parts and components and ammunition, and illegal trafficking and in the transporting of migrants, including by sea.

An ad hoc committee was tasked with drafting the proposed convention and its protocols. Representatives from over 100 nations attended the drafting sessions of this committee (see McClean 2007: 12; Roth 2012: 80). Remarkably, in just 2 years, the CTNOC and its three protocols – the Palermo Protocol; the Protocol against the Smuggling of Migrants by Land, Sea and Air; and the Protocol against the Illicit Manufacturing and Trafficking in Firearms (The Palermo Protocol and the Protocol against the Smuggling of Migrants by Land, Sea and Air are closely related to each other, but they draw a distinction between migrants who provide consent to be moved illegally across borders, which constitutes smuggling, and migrants and other persons who are coerced or fraudulently moved for the purpose of their exploitation, which constitutes trafficking.) – were finalized culminating with the signing conference held in Palermo, Italy, in December 2000. Considered as a “parent” instrument to the protocols, the CTNOC entered into force on 29 September 2003.

The CTNOC articulates that its purpose “is to promote cooperation to prevent and combat transnational organized crime more effectively.” This broad goal has been implemented through two main strategies: (1) “eliminate differences among national legal systems” and (2) create guidelines for domestic legislatures in order to foster national action against transnational organized crime (see Schloenhardt 2015). Gallagher (2010: 74) explains that this “Convention seeks to eliminate ‘safe havens’ where organized criminal activities or the concealment of evidence or profits can take place by promoting the adoption of basic minimum measures.”

Codified in its Article 3, offenses within the CTNOC’s “scope of application” include the “participation in an organized criminal group,” money laundering, corruption, obstruction of justice, and “serious crimes.” In addition to the specific definition of each crime, the CTNOC also requires that the commission of those enumerated offenses be “transnational in nature” and involve an “organized criminal group.”

The fundamental notion of conduct considered “transnational in nature” is that the offense involves more than one state. This is seen in Article 3(2) of the CTNOC which defines an offense as “transnational in nature” if:

(a) It is committed in more than one state.
(b) It is committed in one state but a substantial part of its preparation, planning, direction, or control takes place in another state.
(c) It is committed in one state but involves an organized criminal group that engages in criminal activities in more than one state.

(d) It is committed in one state but has substantial effects in another state.

It is clear from this Article that cross-border action is not necessary for an offense to be “transnational in nature”; all that is required is that the offense in question includes some form of “tenuous potential extraterritorial impact” (see Boister 2012: 13).

In addition to the transnational component, the CTNOC identifies a set of specific transnational organized crimes, offenses within its purview that involve an organized criminal group. Under Article 2(a), the CTNOC defines “organized criminal group” as:

a structured group of three or more persons, existing for a period of time and acting in concert with the aim of committing one or more serious crimes or offences established in accordance with this Convention, in order to obtain, directly or indirectly, a financial or other material benefit.

As Schloenhardt (2015: 414) explains, this definition “combines elements relating to the structure of criminal organizations with elements relating to the objectives of the group.” Boister (2012: 11–12) examination of this definition reveals that it can be understood as comprising of four parts: (1) structured group of three or more persons (acting in concert), (2) existence for some period of time, (3) aiming to commit serious crime, and (4) for a financial or material benefit.

First, the group must comprise three or more persons acting in concert. The concept of a “structured group” has also been defined in the Convention under Article 2(c), as “a group that is not randomly formed for the immediate commission of an offence and that does not need to have formally defined roles for its members, continuity of its membership or a developed structure.” As McClean (2007: 38, 41) notes, this characterization “proceeds by excluding factors rather than including them.” In the Interpretative Note (UNODC 2006: 17), the preparatory works explain that:

[the term ‘structured group’ is to be used in a broad sense so as to include both groups with hierarchical or other elaborate structure and non-hierarchical groups where the roles of the members of the group need not be formally defined.

The concept of “acting in concert” was not further elaborated upon within the CTNOC or its preparatory works. In utilizing common definitions of these terms, McClean (2007: 38–41) explains his Commentary on the CTNOC and its protocols (Commentary) that “the phrase in the text means no more than that this must be a group activity, not merely the simultaneous acts of some of its members each acting on his or her own account.”

The second element requires that the group’s existence be for “a period of time.” This element has been characterized in the Commentary as “remarkably imprecise” (see also McClean 2007: 38–41). While Schloenhardt (2015: 414–418) concludes that this means “single, ad hoc operations” are thereby excluded by this element, McClean (2007: 38–41) proffers instead that “[a]cting with a view to committing a single offence may suffice” so long as the structured group element is also satisfied.
McClean (2007: 38–41) describes the third and fourth elements as ones which “speak of motivation.” Specifically, the third element requires that the aim of the group be “to commit one or more serious crimes” or those offenses specifically articulated within the instrument. Article 2(b) of the CTNOC defines “serious crime” as: “conduct constituting an offence punishable by a maximum deprivation of liberty of at least four years or a more serious penalty.” Interestingly, it is the crime’s potential punishment (under domestic law) which determines its qualification as “serious” as opposed to the actual conduct committed.

Considering these definitions, it is however the Palermo Protocol, not the CTNOC, which is responsible for addressing the crime of “trafficking in persons.” The Palermo Protocol is not a “stand-alone” treaty; states are required to first ratify the CTNOC and provisions contained within the CTNOC “apply, mutatis mutandis,” to the Palermo Protocol (see Gallagher (2010: 73). The Interpretive Notes (UNODC 2006) outline that the meaning of mutatis mutandis is “with such modifications as circumstances require” or “with necessary modifications” and that where provisions of the CTNOC are applied to the Palermo Protocol, they should be modified or interpreted so as to have the same essential meaning or effect in the Protocol as in the Convention. The application of mutatis mutandis cannot therefore require one’s interpretation of the elements of the crime under the parent convention to be so restrictive in order to render those elements nonoperational in the child instrument. Therefore the application of mutatis mutandis and consequent modification to the Convention does not extend to clarifying the interpretational conflict at issue.

This interaction between the CTNOC and the Palermo Protocol ignites the conflict over the interpretation of the construct of trafficking, which will be discussed in the following section.

**Interpretational Tension and Identifying the Definitional Contours of Trafficking in Persons**

On initial examination, it appears that the Palermo Protocol’s relationship to the CTNOC as a supplementary instrument creates an inference that the definition of trafficking only applies to transnational cases (see Gallagher 2001: 983) involving organized criminal groups.

This sentiment seems to be clearly stated in Article 4 of the Palermo Protocol, which outlines its scope as applying:

> except as otherwise stated herein, to the prevention, investigation and prosecution of the offences established in accordance with article 5 of this Protocol, where those offenses are transnational in nature and involve an organized criminal group, as well as to the protection of victims of such offenses (emphasis added).

In seeming direct contradiction, the Commentary and the UNODC’s many publications consistently state that trafficking does not require a “transnational in nature” component or involvement by an organized criminal group (see UNODC
2010:13). As such, it is necessary to investigate whether the elements of transnationality and organized criminal group involvement are required to prove the offense of trafficking.

In addition to Articles 3 and 4, other articles of the Palermo Protocol are also relevant to the construct of trafficking. Specifically, Article 1(3) of the Palermo Protocol states that “offenses established in accordance with Article 5” of the Protocol are regarded as offenses under the CTNOC. Article 5 of the Palermo Protocol requires that states engage in domestic criminalization of trafficking. It reads:

1. Each State Party shall adopt such legislative and other measures as may be necessary to establish as criminal offenses the conduct set forth in Article 3 of this Protocol, when committed intentionally.
2. Each State Party shall also adopt such legislative and other measures as may be necessary to establish as criminal offenses:
   (a) Subject to the basic concepts of its legal system, attempting to commit an offense established in accordance with paragraph 1 of this article
   (b) Participating as an accomplice in an offense established in accordance with paragraph 1 of this article
   (c) Organizing or directing other persons to commit an offense established in accordance with paragraph 1 of this article

The offense of trafficking is therefore fully articulated in Articles 1(3), 3, 4, and 5 of the Palermo Protocol.

Having delineated the limits of the offense within the Palermo Protocol, the CTNOC provides further interpretational guidance (This paper will mostly rely on the VCLT for recognized sources of international law.). Article 34(2) of the CTNOC specifically describes how certain offenses must be established independently of transnational in nature and organized criminal group elements:

The offenses established in accordance with articles 5, 6, 8 and 23 of this Convention shall be established in the domestic law of each State Party independently of the transnational nature or the involvement of an organized criminal group as described in article 3, paragraph 1, of this Convention, except to the extent that article 5 of this Convention would require the involvement of an organized criminal group.

These offenses are the criminalization of participation in an organized criminal group (Article 5), the criminalization of the laundering of proceeds of crime (Article 6), the criminalization of corruption (Article 8), and the criminalization of obstruction of justice (Article 23). As trafficking is not explicitly mentioned here as being an offense under the CTNOC that should be established independently of transnational in nature and the requirement of an organized crime group, it might be inferred that these elements should apply in accordance with the CTNOC in the criminalization of trafficking.

The Palermo Protocol does not itself include an Article creating independence of these elements, particularly in relation to its Articles 3 and 4. Therefore, by omission the independence of the two elements established in Article 34(2) of the CTNOC do
not extend to the Palermo Protocol. Taking this perspective, Article 34(2) of the CTNOC only applies to the Palermo Protocol by direct reference through Article 5 of the CTNOC which specifically criminalizes participation in an organized crime group.

The Commentary regarding the Palermo Protocol consistently states that the transnational nature and involvement in an organized criminal group elements are not required (see UNODC 2010: 13). As McClean (2007: 15) points out, the Commentary explains that the Interpretative Note addressing this point “requires the elements of transnationality and the involvement of an organized criminal group in the context of its provisions as to international cooperation, but not so far as the creation of criminal offences is concerned.”

In relation to the transnational component, Hathaway (2008: 11) criticizes the perception that domestic trafficking occurring within the borders of only one country without the involvement of outside parties would be considered beyond the scope of the Palermo Protocol. Gallagher (2009: 812) clarifies that the purported transnational element exists to require interstate cooperation, not to mandate that trafficking is limited to conduct that is transnational in nature. Gallagher further notes that the Palermo Protocol contains a general obligation on nation states to criminalize “exploitative practices taking place within as well as between national borders” and that the “central and mandatory obligation of all State Parties to the Palermo Protocol is to criminalize trafficking in their domestic legal systems.” In fact, Gallagher notes that she is not aware of any evidence of a domestic statute limiting the definition or the scope of criminalization to only transnational instances.

However, where states have chosen not to include a transnational requirement within their domestic codification, this does not lead to a conclusive outcome on trafficking’s definitional contours in the Palermo Protocol itself. The UNODC’s Organized Crime Issue Paper refrains from determining whether this is in fact, an element of the crime of trafficking. Nevertheless, the Issue Paper noted that trafficking is perpetrated by organized as well as “un-organized criminal involvement.”

The decision to not include these aspects in domestic codification is likely due to the UNODC’s Legislative Guide (2004) which states:

(a) Noninclusion of transnationality in domestic offenses. The element of transnationality is one of the criteria for applying the Convention and the Protocols (Art. 3 of the Convention), but transnationality must not be required as a proof in a domestic prosecution. For this reason, transnationality is not required as an element of domestic offenses.

(b) Noninclusion of an organized criminal group in domestic offenses. As with transnationality, the involvement of an organized criminal group must not be required as a proof in a domestic prosecution. Thus, offenses established in accordance with the Protocol should apply equally, regardless of whether they were committed by individuals or by individuals associated with an organized criminal group and regardless of whether this can be proved or not.

Gallagher (2010: 73) notes of the Legislative Guide, “[w]hile not intended to be authoritative or otherwise deliver a definitive legal interpretation of these
instruments, the Guide is nevertheless a useful source of additional insight, particularly with regard to legislative implementation obligations.” Other UN bodies, including the United Nations High Commissioner for Human Rights, have also defined trafficking as wholly encompassed within the Palermo Protocol’s Article 3 – that is, defined trafficking without requiring transnationality or involvement of organized criminal groups. As such, a prima facie application of the CTNOC, as opposed to strict textual reading of both instruments, may in fact be the cause of confusion for scholars and practitioners alike.

An Interpretational Way Forward?

The absence of the elements of transnational in nature or organized crime group as components in the Palermo Protocol’s definition leads to the inference that these two components are not necessary requirements to prove the offense of trafficking. This raises the question of whether the elements of transnational in nature and involving organized crime groups are present in the Protocol for another reason.

Given that the main driver for the drafting of the Palermo Protocol was to “contest the world’s organized crime networks and combat the trade in human beings and transnational prostitution” (Raymond 2002: 1), one would assume that the first form of this “contest” would be found in the constituent elements of the offense of trafficking. However, it appears that the references to transnational in nature and the involvement of an organized crime group are included simply to provide a universal concept that promotes international standardization and accountability (see Baer 2015: 167).

The insistent requirement within the drafting of Protocol that the elements of “transnational in nature” and the “involvement of organized crime groups” are required, and the equally insistent contradictory interpretations and commentary that says they are not, leads to an examination of whether the elements of “transnational in nature” and “involvement of organized crime groups” might be considered independent requirements pertaining to the obligations of State Parties to the international instrument.

Instead of connecting the transnational and organized criminal group involvement considerations to the material elements of the trafficking offense, this construction can be interpreted as imposing explicit duties and requirements on signatories of the Palermo Protocol (specifically, domestic criminalization of, and international cooperation to combat, human trafficking). Only under circumstances where the trafficking is “transnational in nature” and “involves an organized criminal group” is a State Parties’ commitment (e.g., cooperation) to act triggered. These circumstances do relate to the commitments of the signatories to the international instrument, not to the legal definition of the trafficking offense. This perspective diverts from the concept that the material components of the offense of trafficking are (1) an act, (2) a means, (3) all committed for the purpose of exploitation, (4) involving an organized criminal group, and (5) “transnational in nature” (see Allain 2013: 350–353). By interpreting the requirements of transnationality and organized criminal group in this manner, the international obligation placed on states is an obligation to legislate a more narrowly defined crime (see Gallagher 2009: 812).
This is not to say that the Palermo Protocol decrees that states must or should only criminalize trafficking that is “transnational in nature” and “involves an organized criminal group.” On the contrary, all of the UNODC literature expressly recommends domestic legislation which only embodies the contents of Article 3 of the Palermo Protocol and states have primarily legislated based on the definition found in Article 3 of the Palermo Protocol (see also Gallagher 2009: 813). However, the scope of activity (and therefore international commitment) requiring state action is more limited and may offer a solution to the interpretive tension.

Conclusion

On first impression, the language of the CTNOC and the Palermo Protocol articulates that human trafficking offenses must be transnational in nature and involve an organized criminal group. However, the Palermo Protocol is attached to an instrument designed to address transnational organized crime, which effectively establishes the legal characterization of human trafficking as a “transnational organized crime.” Yet other evidence suggests that human trafficking is not limited to conduct that is transnational in nature and involving organized criminal groups. As a result, there has been conflict and confusion regarding the proper understanding of the definition of the crime of human trafficking in international law.

Based on a strict textual reading of the instrument, its preparatory works, the Commentary and their interpretation by countless UNODC publications, it is clear that transnational in nature and commission involving an organized criminal group are not part of the constituent elements of the offense. Upon review of the instruments and supporting documents, the interpretational confusion is likely the result of a failure to distinguish between the duties and obligations imposed upon states when committing to an international instrument and the contents of the instrument itself and, specifically, the definitions of offenses contained within.

Abstract

Internationally, human trafficking is usually defined officially as involving a range of exploitative scenarios: forced labor, sexual exploitation, illegal adoption, and organ sales are all commonly included. Each of these phenomena, while having some commonalities, also has many different characteristics. When the state or civil society tries to respond to “human trafficking,” it can be difficult to find an approach that works for all these scenarios. This chapter will discuss the strengths and weaknesses and the advantages and disadvantages of endeavoring

to serve the differing populations of people affected by sexual exploitation versus labor trafficking. To substantiate our analysis, we will highlight the experiences of frontline workers by drawing on the findings of 79 interviews conducted in Canada with stakeholders and practitioners in the field. In the context of increased efforts worldwide to counteract trafficking in all its forms, with a notable growing attention to forced labor, this chapter will examine the challenges that arise from tackling diverse forms of trafficking, looking specifically at forced labor and sexual exploitation.

Trafficking for forced labor · Trafficking for sexual exploitation · Anti-trafficking actions · Collaborative approach

**Introduction**

The field of study on trafficking in persons (TIP) has developed greatly since the adoption of the Palermo Protocol at the turn of the century. There has been a shift toward greater attention to forms of trafficking other than for sexual exploitation, notably for forced labor. However, the expansion of the anti-trafficking field faces new challenges and gaps in knowledge as well as in terms of practice.

One area that remains quite overlooked concerns the manifold challenges that arise when different forms of trafficking are addressed by one single entity (be it a coalition, a committee, or a civil society organization). Internationally, TIP is usually defined officially as involving a range of exploitative scenarios: forced labor, commercial and other forms of sexual exploitation, and the removal and sale of organs are all commonly included. (This non-exhaustive list follows the definition of TIP as established by the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime (adopted in 2000).) Each of these phenomena, while having some commonalities, also has many different characteristics. When the state or civil society try to respond to “human trafficking,” it can be difficult to find an approach that works across each of these scenarios.

There has been abundant research on the difficulties encountered in providing assistance to persons who have been trafficked, but it has mainly concerned intervention in the context of TIP for sexual exploitation, including shelters and programs supporting exiting the sex industry. Critics sometimes frame this approach as the “rescue industry” (Agustin 2007).

Further, the importance of adopting a collaborative and multi-sectoral approach in anti-trafficking efforts has been widely acknowledged and called for by scholars and practitioners alike. However, there is little critical, in-depth and comprehensive analysis of the implications and challenges that arise from multidisciplinary actions. Some of these challenges emerge precisely from the difficulties of trying to use one approach to respond to different forms of trafficking. A single entity bringing together the issues of TIP for forced labor and sexual exploitation is likely to face
challenges, for example. To begin with, attention and actions targeting trafficking for labor trafficking are relatively recent. Hence, if compared with the issue of sex trafficking – that has garnered most of the TIP attention so far – addressing labor trafficking entails specific challenges and requires the involvement of new actors (e.g., labor inspectors, trade unions).

This chapter will discuss the strengths and weaknesses and the advantages and disadvantages of endeavoring to serve differing populations of people affected by TIP for sexual exploitation versus TIP for forced labor. (In this chapter, the terms TIP for forced labor and TIP for sexual exploitation will be used interchangeably with labor trafficking and sex trafficking.) We will do so by analyzing responses to TIP that are inter-sectoral, coordinated, and concerted; this approach, usually in the form of coalitions or committees, is commonly used as a means to tackle trafficking in all its forms.

The chapter will draw on the findings of a pan-Canadian study (funded by the Department of Justice of Canada), highlighting the experiences of frontline workers. The study is based on interviews with 79 stakeholders and practitioners from different sectors (community, law enforcement, social services, and health sectors), which were conducted in diverse Canadian cities. One of the objectives of the research was to document and examine experiences of inter-sectoral collaboration in the field of trafficking in Canada.

The chapter will first briefly review definitional debates around trafficking and highlight some key points that inform discussions on the struggles of frontline work in the field of human trafficking. Second, the paper discusses the challenges that arise from tackling specific forms of trafficking within collaborative initiatives, before presenting some promising practices for doing so.

**Practical Insights on the Long-Lasting Definitional Debates Around Trafficking**

Ever since TIP emerged as a public concern, there have been pervasive definitional debates.

A significant part of the definitional discussions concern the role of “representations” of the phenomenon and their impacts on the way trafficking is perceived and conceptualized in policy and practice (Andrijasevic 2010; Kempadoo et al. 2012; Andrijasevic and Mai 2016). Since the early stages of the study of TIP, a critical anti-trafficking scholarship has developed, precisely outlining and discussing the contentions around the definition of TIP and attempting to paint a more nuanced picture (Doezema 2010; Kempadoo et al. 2012; O’Connell Davidson and Anderson 2006; Andrijasevic 2010).

Beyond the legal definition of TIP, the way TIP is understood and perceived is influenced by the way it is represented in mainstream narratives (media, policy statements, NGO anti-trafficking campaigns, etc.). Not only is TIP often equated with sex trafficking, there is a powerful imagery about who is the **archetypical victim**, mainly imagined to be young women and girls, vulnerable and naïve, and readily falling prey to trafficking. As argued by Kempadoo et al. (2012) and
Sanghera (2005), among others, victims of trafficking are embodied by the image of (migrant) women, powerless, helpless and passive, poor migrants from third-world countries, and in need to be rescued by organizations and people from “developed countries” (Kempadoo et al. 2012). Hence, there is also a strong racial component.

Critical studies on trafficking have also highlighted that the common conflation of human trafficking with “sex trafficking” has led to overlook other types of trafficking, particularly trafficking for forced labor. This has been true in terms of research and both public and political attention to the problem. But also, consequently, this conflation of trafficking with sex trafficking has translated into less developed responses in the field of trafficking for forced labor.

Early anti-trafficking understandings strongly associated trafficking with organized crime and hence maintained the idea that TIP occurs outside of the mainstream economy, social values, norms, as well as policies. In other words, trafficking was confined to the underground, the criminal, and the “extraordinary,” and not easily related to labor market structures and labor migration laws (Rijken 2011). In addition, it is the more extreme cases of TIP that generate the most attention and, consequently, the most efforts to protect.

In the same vein, there has been a growing shift toward the use of the term “slavery,” to the extent that slavery, trafficking, and forced labor are sometimes used interchangeably. Some scholars argue that the current discourse on trafficking, portrayed and conceived as a new form of slavery, depoliticizes the wider debate on migration and labor (Andrijasevic 2010), diverting attention from the structural causes of inequalities (e.g. the way the labor market and migrant labor are regulated). As argued by McGrath and Strauss (2015), focusing on extreme cases (that often fall within more specific/individual situations) precludes addressing structural causes and thus leaves aside, without questioning, the overall labor framework and the pitfalls of the labor and migration systems.

Cases of extreme violence and suffering are used as stereotypical examples and illustrations of trafficking. However, such sensational representations of TIP leave more complex issues of human rights violations and labor exploitation in the shadows. TIP does not always involve physical violence, physical confinement, and situations of being “enslaved.” Some forms of exploitation that do not fall within trafficking or forced labor definitions may be perceived as being residual and even tend to be normalized (Anderson 2007), thus creating a “hierarchy of suffering” (Skrivankova 2010: 18).

The blurred or confused definitions and frames have multifold implications, not only in terms of how we conceptualize and understand the issue but also in terms of how responses (political, legal, institutional) are developed. Definitional ambiguities and lack of clarity may “result in either non-recognition or sensational and victimizing labeling” (Piper et al. 2015). In regard to labor trafficking, it has resulted in low visibility and little consideration and, in turn, the under-identification of cases.

Growing concern regarding labor exploitation has the potential to challenge those perceptions. Situations of labor exploitation may occur in the domestic sector or
family-owned businesses (restaurant, hotel), for example, far from organized crime networks. It may relate to international corporations’ responsibility and accountability regarding working conditions in different countries. However, as we will further discuss, (mis)conceptions about trafficking still today impact the identification of situations of trafficking and of the criminal exploitation of migrants.

Further, despite advances in definitional discussions – notably in bringing to the forefront the issue of labor trafficking – debates have offered little in terms of practical insights. Namely, what does it mean in practice to deal with different forms of trafficking? Should a global approach to trafficking – encompassing both situations of TIP for sexual exploitation and TIP for forced labor – be developed and maintained? Or, to avoid diluting efforts, does it make more sense that each sector mobilizes the actors and expertise it needs? This is one of the many challenges in service provision that has been overlooked.

**Addressing Different Types of Trafficking: Need for More Divergence or Convergence?**

The physical, psychological, and socioeconomic recovery of each person who has experienced trafficking require a broad range of resources; no single organization can respond alone to their needs. This explains the importance given to coordination and concertation among organizations from different sectors in the anti-trafficking field. Inter-sectoral and collaborative approaches ensure that the person may access a wide spectrum of services, on the one hand, and, on the other, that knowledgeable actors may help better inform other stakeholders. Further, collaboration may also be a way to combine efforts addressing different forms of trafficking.

The call for better collaboration is not recent. The need to improve coordination and collaboration in service provision – not only between groups in the community sector but also with social service providers, public health, and law enforcement – is commonly acknowledged in scholarly literature, policy documents, and international organizations’ reports. Important gains have been made in this direction worldwide, nationally, and also locally.

However, a distinction has to be made with regard to the type of work or actions being implemented by collaborative anti-trafficking entities. When coalitions/groups/networks focus their actions on awareness-raising and prevention activities, they may not be confronted with the difficulties or limitations related to the fact that they cover different forms of trafficking. On the contrary, outlining the multiple realities that the umbrella term “trafficking” encompasses may well suit the mandate of awareness-raising on trafficking. But if anti-trafficking coalitions/groups/networks start to step into service provision and assistance to victims, they may then be confronted with important challenges.

Let us now turn to the practical challenges – but also opportunities – of addressing different types of trafficking under a single umbrella-organization, committee, or coalition.
Labor Trafficking: Still Under-detected? Or Rather Called by Another Name?

Labor trafficking is still often off the radar of law enforcement. Why are fewer cases of labor trafficking identified? Issues related to definition and understanding have already been raised. In practical terms, this means, for example, in the case of law enforcement, that there is less awareness about the occurrence of the phenomenon, and hence actors are less familiar with the issue:

I mean, a lot of times cops are not very comfortable with the non-traditional form of trafficking which we advocate for. Meaning labor or meaning forced marriages. (Interview 12, Legal Assistance)

As a result, labor trafficking is still a neglected aspect of police intervention and is rarely the object of proactive investigations (Maroukis 2016). There are more resources available and more attention given to TIP for sexual exploitation, and often law enforcement can draw upon already existing experience and knowledge working in the ambit of the sex trade. In some cases, dedicated teams within the police force, focusing on TIP for sexual exploitation, might exist.

Another difficulty in detecting cases of labor trafficking is that the initial arrangement is usually voluntary. The person has consented to migrate (if migration is involved) and to engage in a labor arrangement. Coercive recruitment in situations of labor trafficking is not common. However, this is not to say that coercive recruitment is a common feature of sex trafficking. Further, as it has been documented through case law analysis (Beatson et al. 2017; EC 2015), indirect forms of coercion (such as withholding of wages and threat of penalty) as opposed to direct forms of coercion (e.g., threat to safety, violence) are less accepted in court as a form of coercion and, as a consequence, as an indicator of trafficking.

Within the law enforcement realm, the literature on trafficking has already documented the challenges encountered in trafficking investigation work. Awareness of trafficking for labor exploitation is new and still little understood. Investigations are more complex (Sikka 2013). It often involves an intricate combination of violations of labor standards, immigration policies, and criminal charges that can be both under immigration law and the criminal code (Sikka 2013; Dandurand and Chin 2014) and thus requires a combination of different expertise. Further, cases of labor trafficking mostly involve migrants, who often become undocumented through the process of exploitation. There might be breaches or misuses of legal temporary migration programs, as is the most common scenario in Canada, for example (Beatson et al. 2017). Migrants with a precarious migration status are much more reluctant to disclose and come forward to the police and authorities.

Challenges in the identification of labor trafficking cases go far beyond law enforcement. It is shared among different sectors. Despite the existence of legal definitions of trafficking, there is an ambiguity regarding “clear” parameters for a situation of exploitation to correspond to trafficking. For example, some situations may involve offences under civil or labor law (unpaid salary, breach of contract, non-respect of labor standards); others involve more severe forms which then fall under
the scope of criminal law (e.g., use of physical violence or threat to one’s safety, confiscation of identity documents).

Further, it is important to include in the discussion not only the challenges of identification but also the reluctance of both practitioners and persons in exploitative situations to use the “trafficking frame” as the avenue for intervention. The focus on the problem of “under-detection” as being primarily linked to a lack of knowledge presupposes that detecting trafficking situations constitutes the starting point of intervention for protection, that identifying situations as “trafficking” is what everyone wants and thinks is best. However, this is not the case. Practitioners may well opt not to use the trafficking lens and it may be a deliberate choice. The fact that victims do not see themselves as trafficking victims and may even refuse assistance designed under the trafficking frame has been documented (Brunovskis and Surtees 2012). However, frontline workers can also be reluctant to name certain situations as trafficking, not because of a lack of awareness but because they do not always see an added value to it. This element has been less discussed. In a right-based approach, and empowerment perspective, the core of the intervention is the well-being, the interest, and the protection of the person. For example, when the person is undocumented, collaboration with law enforcement represents a concrete risk of being criminalized and deported, rather than having their rights protected. Once law enforcement is aware of their status, the person is vulnerable to detention and deportation. Yet being identified a victim of trafficking by law enforcement and immigration authorities may be one of the few, if not the only, way for undocumented migrants to get substantial assistance (as well as a temporary stay permit in the country).

This dilemma is important as practitioners’ evaluation will determine the avenue of intervention: the legal and criminal route versus the labor violations and access to remedies route (or both). Access to justice (more generally) and to compensation (more specifically) are avenues advocated as key components of programs of assistance and services for persons affected by trafficking (Comp.Act 2012). Compensation may include claiming for unpaid wages or remedy for damages as a result of the exploitation (p. 3).

Finally, there is also an important political dimension to the identification of, or even the framing as, labor trafficking:

One of the reasons why so few people have been designated as trafficked and provided with assistance is the lack of political will to tackle the widespread exploitation that undergirds industries like agriculture and domestic work. There are many stakeholders that benefit from normalising migrant exploitation; sometimes entire industries rely on low-wages. (…) Acknowledging trafficking makes visible capitalism run amuck and the link between migrants’ legal status and exploitation. (Brennan and Plamblech 2018: 2)

Including Labor Trafficking Means Working with “New” Actors

Another axis of difficulty is related to the fact that working with different types of trafficking implies working with very diverse collaborators and partners. Anti-trafficking coalitions, networks, and alliances have, for the most part, initiated
their work with a focus on TIP for sexual exploitation. In other words, many anti-
trafficking organizations were created with a mandate that was often limited to sex 
trafficking. As more attention was dedicated to issues of TIP for forced labor, new 
actors who were not (or to a lesser extent) solicited in early anti-trafficking efforts 
were brought together, such as trade unions, labor standard agencies, workplace 
inspectors, etc. Working across different sectors of intervention – at times with very 
different mandates and missions – represents a significant challenge regardless of the 
type of trafficking and even if only addressing one form of TIP. But this reality is 
amplified in contexts of combined response to multiple forms of trafficking. In 
addition, for many of the labor-related organizations or migration-related organiza-
tions, dealing with trafficking constitutes only a fraction of their work. Trafficking is 
often not an explicit part of their mandate, or, when included, it constitutes a minor 
issue rather than a priority. This also brings an additional layer of complexity when it 
comes to collaboration.

The way trafficking is understood by actors from different sectors is shaped 
and informed by very different approaches to intervention. Divergent definitions 
of trafficking (from narrow and restrictive to broader views of the continuum of 
exploitation and the importance of tackling structural inequalities) are common, and 
these divergent definitions often oppose state actors (typically working with the legal 
definition of trafficking) with nongovernmental actions (who are more likely to have 
a broader human rights and structural view of the issue). Further, specific organiza-
tional mandates will, of course, determine the parameters and orientation of inter-
ventions, which can also create further division or tensions. For example, 
organizations whose mandates focus on immigration or labor issues will have a 
different approach to organizations whose mandates have a feminist lens and focus 
on women’s issues such as domestic violence and sexual exploitation.

As an illustration of this point, it may be legitimate to raise such questions as: “Is 
it possible, for example, for labor-focused advocacy, which may call for unionization 
to protect workers, to sit alongside advocacy that problematizes the label ‘sex work’ 
as a failure to recognize that this work is inherently gendered and exploitative” 
(Piper et al. 2015: 1). In other words, is it feasible to reconcile such divergent 
mandates and if so, how?

Then, perhaps less evidently, the divergence of mandates and missions is not 
limited to the type of trafficking. Even within the ambit of TIP for forced labor, there 
are important labor and sector-specific dimensions and needs to take into consider-
ation. Cases of labor trafficking may occur in very diverse settings: in a private 
household, supply chains, fishing industries, construction, agriculture, etc. It may 
occur through a process of recruitment based on informal individual and social 
networks, or recruitment may occur through the use of intermediaries and employ-
ment agencies (including fraudulent ones). Gaining knowledge and awareness of 
such diverse settings is not an easy task. It requires very different actors or even 
sectors and may require different actions and interventions.

The importance of the role of labor inspectors has been pushed to the forefront 
and called for by advocates and researchers alike (Piper et al. 2015; Robinson 2015; 
ILO 2016). Not least among them, the ILO Forced Labor Protocol 2014 has
emphasized the crucial role of labor inspections and the need to reinforce them. The inclusion of labor inspections in anti-trafficking actions, or inversely the inclusion of trafficking within labor inspectorates’ mandates, is uneven across countries. Labor inspectorates commonly have the power to monitor and investigate (or document) labor rights violations, but not offences of a criminal nature. Advocates of people facing labor exploitation and TIP for forced labor also often call for a division of labor and immigration investigations in order to protect victims with irregular immigration status from detention and deportation. A further inclusion of trafficking within the ambit of their action may require changes in labor inspectors’ mandates or entail a closer collaboration with criminal law actors and immigration advocates.

As for trade unions, engaging in anti-trafficking actions raises specific challenges (Marks and Olsen 2015). Some sectors where exploitative practices and trafficking occur – which are characterized by isolation, informality, and difficult outreach – may render collective actions more difficult (Hanley et al. 2012). Some sectors also mostly involve temporary migrant workers. As a consequence, there might be a need to rethink ways to protect workers’ rights and making new and international alliances.

**Between National and International Cases of Trafficking**

Another line of difficulty that may arise concerns the differentiation between situations involving nationals (residents or citizens) versus when it involves international migrants, in other words between international and national cases of trafficking. The importance and attention given to domestic trafficking, which does not involve the crossing of a border, varies according to national contexts and specificities. Although in some countries, TIP for sexual exploitation may have an important “national” or domestic component – meaning it affects large numbers of citizens and permanent residents – labor trafficking, in contrast, is often exclusively associated with situations involving international migrants.

For example, the Canadian anti-trafficking policy is characterized by its strong focus on TIP for sexual exploitation and particularly on the occurrence of this phenomenon within the country, without necessarily involving international border crossing for victims or perpetrators. This trend has also been observed in the United States and northern European countries (Choi-Fitzpatrick 2016). Linking trafficking with young people, especially girls, in the sex trade in Canada has been a trigger to mobilize political and NGO efforts. For strategic reasons, indigenous women’s organizations in Canada have also linked the concept of trafficking to the disappearance and murder of women and girls from their communities (Kaye 2017). The linking of sex trafficking to domestic victims has served to give visibility to an issue that was previously not attracting such public sympathy and concern (a problematic situation in itself). However, this association has also had the negative effect of channeling most government and private foundation funding to combatting this form of trafficking (De Shalit et al. 2014), neglecting the challenge of labor trafficking.

This context has also led to the mobilization of actors involved with youth in the sex trade and shelters for (non-migrant) women within key coalitions or concerted
initiatives. As a consequence, knowledgeable actors regarding the realities of migrants and immigration laws and policies are often absent or very few around the table of anti-trafficking coalitions, alliances, and networks, a significant gap (Ricard-Guay and Hanley 2015). Regularization of migratory status is one of the primary needs of international victims. Knowledge about the different migration statuses and their related rights is essential and will affect the types of response and protection that are provided. The decision about what to do about immigration status – in the Canadian context, whether to pursue a temporary resident permit for victims of trafficking in persons (TRP-TIP), to make a refugee claim, and to apply for permanent residency through a humanitarian and compassionate claim – requires specialized knowledge and skills. The sensitive (often problematic) nature of the collaboration with law enforcement, while being common to various forms of trafficking, either national or international, becomes at times insurmountable when it comes to undocumented migrants.

The Delicate Collaboration with Law Enforcement for Undocumented Migrants

The definition of trafficking – as internationally agreed – builds on the definition of a crime. Hence, ultimately, the formal recognition of a situation of trafficking resides with law enforcement authorities, and then the judiciary, if a legal proceeding is initiated. Hence, access to public programs of assistance for victims of trafficking (including temporary residence permits, legal and psychosocial assistance, immediate and longer-term shelter, and other social rights (health, counseling)) is tributary to the binary decision: is it or is it not a situation of trafficking? Collaboration with law enforcement is, in most (if not all) cases, sensitive, given many victims’ reluctance to disclose to authorities their involvement in – more often than not – undeclared or even illegal activities. In situations involving undocumented migrants, it becomes even more of a dilemma.

As we know, if a migrant is not formally identified as a trafficking victim, those without proper stay (or residence) permits risk being deported. To access the temporary visas for trafficking victims that exist in many countries, such as in the European Union, in Canada, and in the United States, migrants have to be officially identified as victims of trafficking. In addition, and more problematically, the collaboration of the victim in legal proceeding against the traffickers is often a requirement to access the assistance and protection measures. In Canada and in Italy, even if the law does not require formal criminal charges against the trafficker to be laid in order for a person to be officially identified as a trafficking victim, in practice, not having an open investigation greatly impedes access to the temporary visa. Hence, it renders collaboration with law enforcement necessary in order to ensure status.

The challenges in collaborating with law enforcement is a shared reality regardless of the type of trafficking, but for the reasons discussed above, these challenges are greater for undocumented migrants affected by TIP for forced labor outside of the
sex industry. Further, in the case of labor trafficking, labor inspectorates become part of law enforcement, as they may become involved in denouncing undocumented migrants. Yet, even in situations in which a decision is made not to disclose a trafficking situation to law enforcement authorities, the risk of deportation remains and legal support and advice is still an important dimension of intervention.

**Beyond the Criminal Law Framework: Access to Remedies and Justice for Migrant Workers Facing Exploitation**

As compared with sex trafficking, which in most countries is not dealt with as a labor issue, dealing with labor trafficking requires broadening the scope of anti-trafficking knowledge to include tools and advocacy toward fair, just, and decent work conditions for all, which includes a strong focus on undocumented migrants’ rights. As well, when dealing with labor trafficking (or labor exploitation taken more broadly), alternative forms of access to remedies not commonly thought of as related to trafficking (e.g., through an employment tribunal) become possible for workers whose labor rights are being violated.

However, employment and labor law remedies (e.g., reclaiming unpaid salaries) are not widely used in all jurisdictions. These remedies are often inaccessible for migrant workers or seen as largely ineffective; the procedures are long and migrants may have to return to their country before a settlement is achieved (Ricard-Guay 2016). The situation for undocumented migrants is even more precarious. Even if, in some countries (e.g., in most of EU Member States, FRA 2015), undocumented migrants are entitled to claim remedies, in practice it is very difficult if not impossible to do so. For example, at the European level, the Employer Sanctions Directive (Directive 2009/52/EC of the European Parliament and of the Council of the 18 June 2009 providing for minimum standards on sanctions and measures against employers of illegally staying third-country nationals), adopted in 2009 and transposed in national legislations (except the UK) in subsequent years, aims to tackle the irregular employment of non-nationals. Some of the provisions seek to ensure the protection of labor rights of undocumented migrants. On the one hand, just the fact of recognizing the rights of workers regardless of their migration status is already an achievement. However, the primary goal of this directive is to criminalize the employers’ decision to hire undocumented migrants (Rolland and Soova 2015), something that will, on the other hand, make it difficult for workers to decide to make a complaint. In addition, it is centered on wage compensation and does not address all of the other rights of migrant workers.

**The Gender Bias**

When it comes to setting priorities, resources are still predominantly allocated to efforts to tackle TIP for sexual exploitation and in particular to women and girls. This is another challenge that coalitions and anti-trafficking organizations must
confront when responding concomitantly to TIP for forced labor and sexual exploitation. This gender bias is an important one to consider when coalitions or networks try to address sex and labor trafficking together. The stereotypical image of the ideal victim, discussed earlier, is persistent and still present today. As stated by Andrijasevic and Mai (2016), despite decades of research and activism, the image is still that of a young migrant woman tricked into prostitution and held physically confined against her will (p.4). Men are less easily seen as a victim of trafficking.

Gender biases do not only have an impact on giving more or less attention to certain dimensions of trafficking – women and girls being associated with TIP for sexual exploitation and men with TIP for forced labor – but it also results in lower investment in resources for men. We know little about the needs and experiences of men in the aftermath of trafficking, a field of knowledge that would be essential to the development of interventions tailored to their needs (Surtees 2018).

In a study conducted in Canada, results from the interviews with practitioners across the country showed that one key challenge for actors working in anti-trafficking organizations, coalitions, or networks was the absence or scarcity of existing resources to provide support to men victims of trafficking. Notably, with regard to shelters and specialized psychosocial support, resources were very often exclusively available for women. Those working with men victims had to turn to volunteer and activist support (Ricard-Guay and Hanley 2015).

Too often, anti-trafficking assistance and protection are focused on and limited to the rescue and rehabilitation of women and girls after TIP for sexual exploitation. Shelters for women and girls “rescued” from sex trafficking have been opened by civil society, international organizations, and faith-based groups in numerous countries to support their recovery and rehabilitation. Yet, this “rescue industry,” which channels funding streams, can have detrimental effects, either by involuntarily sending women and girls back to their countries of origin (through the so-called voluntary return programs) or by sending them to shelters with restrictive rules without responding to their particular needs and aspirations. (On this topic, see GAATW 2007 and Plambech (2014).)

**Combined Efforts to Tackle Multiple Forms of Trafficking: What Are the Advantages, Then?**

Despite all of the challenges discussed so far regarding what we can frame as “combined anti-trafficking efforts,” one could argue that addressing both types of trafficking together has had the positive effect of drawing more attention to labor trafficking. By including labor trafficking as an axis of intervention, thereby integrating new actors, the anti-trafficking coalitions/networks or organizations have managed to raise awareness about the issue. Further, by bringing together practitioners and organizations that were not traditionally working closely together, new opportunities for dialogue may have opened. Most importantly, including divergent forms of human trafficking may have helped frontline workers to open their horizon.
of understanding how people who have experienced trafficking see their situation and what they want for their futures.

The shift toward greater attention and interest for labor trafficking has also involved a shift toward a labor rights approach. This means that questions related to policies and laws – both in the fields of labor and, in particular, labor migration – have entered the discussion on trafficking. In terms of actions, it entails pursuing advocacy work toward greater protection of migrant workers’ rights. In that perspective, in engaging with labor trafficking issues, it becomes necessary to address more structural factors conducive to trafficking and obliges a questioning of the socioeconomic and political dimensions at the root of exploitative practices. Trafficking in the sex industry is compounded by its links to criminalization and links to criminal networks in all countries where sex work is illegal (partially or completely). The political debate that seeks to address the prevention of exploitation in the sex industry too often remains limited to the discussion about the pros and cons of decriminalizing the sex industry. In the case of trafficking for forced labor, the discussion goes beyond the criminal lens and touches the types of policies in place that may produce, reproduce, or reinforce inequalities or vulnerabilities conducive to different forms of exploitation. Indeed, a labor rights approach to trafficking builds on a premise that multiple factors will play a role in setting conditions conducive to trafficking, including the legal, political, and socioeconomic contexts, thus including immigration, labor and employment, and criminal laws (Shamir 2012). That being said, a labor and migrant rights approach has also been at the core of sex workers’ advocacy, activism, and scholarship.

The anti-trafficking framework, as developed so far, has mainly focused on “rescue” types of intervention. Bringing a labor protection component into the anti-trafficking framework requires addressing employment regulations and labor laws. It bears the potential of developing more and new tools to address exploitation of workers and to prevent it.

At the international level, the adoption of the ILO Forced Labour Convention, along with the Recommendations on Supplementary Measures for the Effective Suppression of Forced Labor (No. 203), has strengthened a labor approach to trafficking, integrating the consideration of labor rights within the anti-trafficking framework. It includes recommendations to strengthen labor inspections, tackle fraudulent recruitment practices, and expand labor law and labor rights to all workers, regardless of their immigration or employment status. One gap that remains to be addressed is the liability and responsibility of corporate actors for trafficking that occurs along supply chains.

**Conclusion**

In this chapter, we have explored how definitional discussions on trafficking have been linked to the types of interventions that are offered or available to people seeking to exit a situation of trafficking. While in many regards, persons who have been victims of trafficking will have similar needs in terms of protection
Questions about defining trafficking raise the more fundamental issue of whether the very concept of trafficking is useful to interventions. Isn’t trafficking just one extreme of a broad continuum of exploitation? Do the attention and resources focused on trafficking overshadow the plight of people who are exploited in other ways, more numerous and just as deserving of support and compassion? Is the “anti-trafficking” movement creating a category of “deserving victims” whose needs count for more, and who have a greater right to receive help, while abandoning those who don’t happen to fit the definition (Hanley et al. 2006)? As we have already discussed, many frontline workers do not think it is essential to their work to name their client’s situation as trafficking; this would make absolutely no difference to the way they intervene. However, some frontline workers may also believe, rightly or wrongly, that in specific contexts trafficking raises greater indignation and has become a priority, and that the interest in trafficking has created a greater recognition that all forms of exploitation are unacceptable.

As it has been discussed in the chapter, the shift toward greater attention for labor trafficking, and the shift toward a labor approach to trafficking, requires an expansion of the fields of expertise and sectors involved. It may be challenging to do so, but at the same time it bears the potential of developing new tools and new avenues of protection, beyond the narrow criminal lens. Combining the efforts of actors more traditionally connected to TIP for sexual exploitation with actors more traditionally connected to TIP for forced labor may help broaden our understanding of trafficking and better inform us (practitioners, researchers, and other stakeholders) about both how to prevent TIP and also how best to provide support, assistance, access to remedies, and protection that respond to the needs of the persons directly involved.

Abstract

Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims has expressly included the exploitation of criminal activities as one of the possible purposes of this crime. Consequently, not only was the concept of human trafficking broadened but also the difficulties in identifying victims, particularly in this type of exploitation in which many trafficked people are actually treated as criminals. This chapter will examine the wide variety of actions that can amount to human trafficking for criminal exploitation, using facts and cases reported by governmental and nongovernmental organizations as key documents. These experiences will highlight the challenges of differentiating between criminals and trafficking

**Introduction: Broadening the Concept of Human Trafficking**

The definition of human trafficking provided by the Protocol to Prevent, Suppress and Punish Trafficking in Persons Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime (hereinafter Palermo Protocol) in 2000, has served as a basis to incorporate a concept of this crime into most national and supranational anti-trafficking legal instruments since then. The three elements (actions, means, and purposes of exploitation) that, according to the United Nations, characterize human trafficking have been present in the vast majority of definitions all over the world. Its influence has been such that many criminal codes have almost literally reproduced the wording of the Palermo Protocol.

Although it continues to follow this tendency, the most recent European legislation on this matter has considerably broadened the scope of the international definition by including new forms of exploitation. In reality, nothing prevents states party to it from expanding the concept of human trafficking in this way, since the Palermo Protocol itself expressly indicates that the catalogue of purposes of exploitation is just a list which has been kept “at a minimum.” In fact, United Nations Model Law against Trafficking in Persons indicates that states may consider including other forms of exploitation in their criminal law, among them “the use of illicit or criminal activities [including the trafficking or production of drugs]” (United Nations 2010, p. 26).

Thus, Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims expressly incorporates “the exploitation of criminal activities” as one of the possible purposes of this crime (Article 2.3). The European text clarifies that “[t]he expression ‘exploitation of criminal activities’ should be understood as the exploitation of a person to commit, inter alia, pick-pocketing, shop-lifting, drug trafficking and other similar activities which are subject to penalties and imply financial gain” (Directive 2011/36/EU, Recital 11).

This explanatory note aims to clarify one of the most important questions raised by this provision: its range of application in practice. Strictly following this note, the new modality of exploitation requires two aspects: the activity must be penalized and it must have an economic nature. However, these assumed requisites have not been free from objections. The first element has been considered unable to clarify the concept and therefore unnecessary and redundant, since all criminal activities will by definition be subject to a penalty. On its part, the need to obtain financial gain can also be criticized, since it seems to exclude from the scope of human trafficking the exploitation of people in criminal activities that do not, at least directly, generate economic profit, such as the use of children in armed conflicts. In reality, this debate connects with a more general yet unresolved discussion: whether exploitation as a
purpose of human trafficking should always have an economic nature. If that was the case, those cases in which the trafficker aims to obtain any other benefit or pleasure, even of a personal nature, would also be excluded (Borg Jansson 2015).

At this point, it is necessary to clarify that the inclusion of “the exploitation of criminal activities” among the purposes of trafficking does not necessarily mean that the exploitation of forced criminality should be automatically excluded in relation to human trafficking cases when it is not specifically foreseen in the law. Forced criminality can easily be included within the broad concept of forced services, providing that the unlawful activity has been exacted “under the menace of any penalty and for which the said person has not offered [themselves] voluntarily” (International Labor Organization, Forced Labor Convention, No. 29, 1930, Article 2; Skrivankova 2018). Therefore, even if, due to the requisites established by the explanatory of the directive, some exploitative activities would be excluded from a restrictive concept of “forced criminality,” they could still amount to forced services and ultimately to human trafficking. As Klara Skrivankova (2018) points out, the methods of coercion used in forced criminality are similar to those used to exploit workers in agriculture: victims are commonly not allowed to keep the profits, and they are forced to carry out the activity against their will. However, in this case, it is necessary to take into account the special risks of the criminal activity, derived from the performance of the illicit work itself or from its criminalization (Skrivankova 2018).

Thus, the first section of this chapter aims to clarify the scope of forced criminality by means of real experiences and cases reported by governmental and nongovernmental organizations. This analysis will help us understand the real reach of this purpose of exploitation in practice, in order to offer more appropriate interpretations for this new legal provision. Once its potential range of application has been demarcated, the following section exposes the main difficulties in identifying victims of this modality of trafficking, who are often mistakenly criminalized for the offenses they have been forced to commit. For this reason, the last section of this contribution highlights the importance of non-criminalization and/or non-punishment mechanisms, which should be correctly implemented in order to adequately protect victims of human trafficking for the purposes of forced criminality.

**Forced Criminality as a Purpose of Human Trafficking**

Leaving aside the controversies exposed in the previous section, human trafficking for the purposes of forced criminality can be defined as the recruitment, transportation, transfer, harboring, reception, exchanging, or transferring of control over a person, using coercive, fraudulent, or abusive means, in order to exploit them by forcing them to commit criminal activities.

This modality of human trafficking is not a new phenomenon, although it has been identified as an increasing trend (RACE 2014). As is always the case with human trafficking, current data collection systems are inadequate for providing a complete and accurate idea of the true nature of this type of exploitation (RACE 2014). Nevertheless, data offered by some international organizations can give a
general idea of the dimensions of this form of criminality. The most recent United Nations Office on Drugs and Crime Global Report on Trafficking in Persons states that cases of trafficking for the commission of illegal activity have been reported in Europe, Central Asia, South America, and Africa (UNODC 2016). According to this report, about 1% of the total number of detected victims in 13 countries were trafficked for forced criminality (UNODC 2016).

The United Kingdom (hereinafter UK) is one of the few countries that acknowledge criminal exploitation in official statistics about trafficking. Out of the 2255 potential victims of trafficking identified there in 2012, 362 (16%) were victims of forced criminality. The two most common activities for which victims were exploited were cannabis cultivation and petty crime (RACE 2014). Another state that offers specific data on this issue in national reports is the Netherlands. The Dutch National Rapporteur’s office registered 18 potential cases of trafficking for forced criminal exploitation in 2012 (RACE 2014). Similarly, the Spanish Intelligence Centre for Counter-Terrorism and Organised Crime (CITCO) informed about the detention of 7 perpetrators and the identification of 15 victims of trafficking to commit criminal activities (CITCO 2016). Victims came originally from Bosnia and Herzegovina, Romania, and Croatia (CITCO 2016). Nevertheless, although the situation is improving, the vast majority of countries still do not recognize this form of exploitation and, consequently, do not take steps to address it (RACE 2014). Overall, this issue “is more widespread than is currently reported” (RACE 2014, p. 8).

The few existing reports and research carried out on this topic show that this form of trafficking especially affects children (Council of the Baltic Sea States 2013; RACE 2014). In this sense, it is necessary to remember that no means are needed when the victims are minors. In general, regardless of whether they are children or adults, people exploited for the purposes of forced criminality are often engaged in activities that require a low level of expertise and which involve a high risk of detection by law enforcement authorities (EUROPOL 2016). A study by the RACE in Europe project (2014) found that trafficked people are being exploited for the following criminal activities across Europe:

- Theft (including pickpocketing, ATM theft, and shoplifting)
- Benefit fraud
- Cannabis cultivation
- Drug trafficking/smuggling
- Counterfeit goods production (such as DVDs and cigarettes)
- Illegal charity bag collection
- Begging (criminalized in certain jurisdictions such as Romania and Bulgaria)
- Sham marriage
- Illegal adoption
- Metal theft
- Methamphetamine production (RACE 2014, p. 64).

By means of real experiences that have been reported, the following subsections will provide a general overview of some criminal activities in which trafficked victims can be exploited.
Drug Crimes

Human trafficking victims are usually forced to engage in the production and distribution of drugs in exploitative conditions. The use of trafficking victims in drug-related offenses increases the profits obtained through this illicit activity, since more substances can be produced and distributed without having to pay to do so. At the same time, since they are more exposed to investigations, trafficked people serve as a shield that protects drug (and human) traffickers from detention and criminalization.

Trafficking for the purposes of exploitation in cannabis cultivation has been detected in several countries in Europe. In 2009 three Vietnamese minors were arrested and convicted in the UK for working in cannabis production factories. Later on, in 2013, a sentence of appeal annulled that conviction for drug-related crimes, since those young people were actually victims of trafficking in human beings (\textit{L, HVN, THN, and T v R} [2013] EWCA Crim 991). Trafficking for the purposes of forced criminality has reportedly increased by 130% between 2011 and 2012 in the UK, where the vast majority of victims (96%) come originally from Vietnam, most of them being children (81%) (\textit{RACE} 2014). Cases of exploitation through cannabis cultivation have also been reported in official statistics in the Netherlands (\textit{RACE} 2014). In Ireland, although no information is provided by the state, the Migrant Rights Centre identified in 2014 23 cases of potential victims trafficked for cannabis cultivation, coming primarily from Vietnam and China (\textit{RACE} 2014). Similarly, in spite of the lack of official statistics, NGOs and the media have reported potential cases of trafficking for cannabis cultivation in the Czech Republic (\textit{RACE} 2014) and Denmark (Council of the Baltic Sea States 2013).

Cannabis cultivation usually takes place in dog kennels, public houses, converted industrial warehouses, and containers buried underground, usually located in suburban areas. These facilities are adapted and provided with the appropriate equipment to allow production: hydroponics systems, high-intensity lighting, ventilation, extraction fans, etc. (\textit{Tri.x} 2017). Victims of exploitation in cannabis farms are usually deceived. They are often offered a job in a restaurant, but they are subsequently isolated, locked in the facilities where the plants are grown, and forced to work as gardeners of the cannabis plants (\textit{RACE} 2014). Both adults and children usually live in the place where cannabis is grown, forced to sleep on the floor or in cupboards (\textit{RACE} 2014). Debt bondage is a common way of controlling victims. Debts can rise up to between 17,000 and 20,000 lbs (\textit{RACE} 2014). An illustrative case was reported in the UK, where a 47-year-old Vietnamese woman, who had been forced into prostitution, was later on pressured into growing cannabis in order to “repay” the debt she had with those who transported her to the UK, since she was “unprofitable” due to her age (\textit{Burland} 2017, p. 7).

Hales and Gelsthorpe (2012) analyzed 103 migrant women in prisons and immigrant detention centers in the UK and found that 43 of them had been victims of trafficking. Among the interviewees, they identified several cases of women who had been deceived to work in the production of cannabis and two cases of importation of drugs under duress. In a similar study, in which 45 migrant women held in
two Spanish penitentiary centers were interviewed, Villacampa and Torres (2015) reported the existence of ten potential victims of trafficking who had not been identified. Of these ten women, eight had been convicted for drug trafficking.

These studies show that trafficking can also occur for the purposes of exploitation in drug distribution. Adults, especially women, can be forced to become drug mules in order to repay their debts. The use of lover boys, that is, men posing as boyfriends to emotionally blackmail and trick women into drug smuggling, has also been reported (RACE 2014). As was the case with cannabis cultivation, this form of exploitation also affects children. The US Department of State warned that organized criminal groups coerce children to work in the production, transportation, and sale of drugs in Mexico. Besides, a recent report by the UK Home Office has made available information about the use of children for criminal exploitation in county lines, that is, “urban gangs supplying drugs to suburban areas and market and coastal towns using mobile phone lines” (Home Office 2017, p. 2). Gangs use children to deliver drugs because they are cheaper, easier to control, and less likely to be caught by the police (Home Office 2017; Sands 2018). In fact, “clean skins,” that is, children with no previous criminal records, are especially targeted (Sands 2018).

Property Crimes

In a notification published in 2014, EUROPOL warned about the existence of children “trafficked to be forced to commit different types of property crime, such as burglaries, robberies, shoplifting, metal thefts, home-jackings or ATM theft” (EUROPOL 2014, p. 2). Cases have been reported in the UK, the Netherlands, Germany, France, Sweden, and Norway (Council of the Baltic Sea States 2013; United States Department of State 2014; RACE 2014).

The exploitation of trafficking victims through property crimes has been identified as an increasing trend, closely linked to the activity of organized crime groups (Crocker et al. 2017). It usually affects foreign nationals, both adults and children, in situations of vulnerability (Crocker et al. 2017). Victims of this form of trafficking are usually transported in small groups to places where they are forced to steal handbags from people, as well as cosmetics, telephones, USB sticks, GPS systems, and other electronic devices in shops (Council of the Baltic Sea States 2013). They are tactically sent out to commit shoplifting or pickpocketing until they receive their second police caution, when they are moved to another place or sent back to their country (Crocker et al. 2017).

This type of exploitation often comes together with other forms of forced labor. Individuals made to work long hours on farms with very low wages are also forced to steal to pay their “debts” (Crocker et al. 2017, p. 7). Similarly, cases of women trafficked for sexual exploitation being forced to steal their clients’ property, such as wallets or phones, have also been reported (RACE 2014). The profits derived from these illicit activities are surrendered to the traffickers, although in some cases, victims are allowed to keep part of it as a reward or in order to pay the debts they owe the traffickers (Schloenhardt and Markey-Towler 2016).
Violent Crimes

As has been shown in the introduction, it is debated whether human trafficking for the purposes of criminal activities includes the exploitation of individuals to commit violent crimes that do not necessarily produce economic profits. Some official reports already include violent crimes when talking about this form of trafficking. Eurostat, for example, includes terrorism, together with drug trafficking and petty crimes, in the list of criminal activities that may constitute the purpose of trafficking (Eurostat 2015). Equally, a report published by the US Department of State mentioned “terrorism and murder,” as well as “theft, illicit drug production and transport, [and] prostitution,” in the catalogue of offenses that trafficked individuals might be forced to commit “in the course of their victimization” (United States Department of State 2014, p. 1). This subsection will analyze previous studies in which people who were forced to commit violent crimes have been considered victims of trafficking for criminal exploitation.

The forced participation of women and children in armed conflicts has been long studied. The US Department of State in 2013 warned of the existence of Afghan and Pakistani children serving as suicide bombers. Moreover, a couple of recent pieces of research carried out in Colombia addressed the possibility of considering these facts as human trafficking (Hurtado et al. 2017; Villacampa and Flórez 2017). These papers show that people were forced to perform different tasks. Some of them were neither crimes nor directly related to the armed conflict, such as cooking and cleaning. However, the women and children interviewed had also been forced to take part in combat, plant landmines, kill, kidnap, and perform other essential tasks in the context of war (Hurtado et al. 2017; Villacampa and Flórez 2017). In the case of women, labor and criminal exploitation was accompanied by sexual exploitation, forced abortion, or the administration of medicines to induce abortion in other women (Villacampa and Flórez 2017).

Villacampa and Flórez (2017) concluded that 16 out of 20 women interviewed (80% of the entire sample) who were serving sentences in a Colombian prison for crimes committed within the guerrilla were actually victims of human trafficking for the purposes of criminal exploitation. Their interviews show that the three elements of the crime had been fulfilled. First, they were recruited and transferred from rural areas to the jungle, where they were completely separated from their social environment with no possibility of communication. The recruitment, transportation, and reception for the purposes of exploitation had been achieved by means of violence, deception, and the abuse of a position of power or vulnerability. Ultimately, if we consider that the tasks they carried out are the exploitative purpose of trafficking, the third element would be satisfied.

The commission of violent crimes together with other types of exploitation can also occur outside the context of an armed conflict. An illustrative example has been reported in the Netherlands, where a girl who had been trafficked from India to be kept in a situation of almost total serfdom, being completely isolated and constantly beaten up, was instructed under duress by her captors to kill a boy (Dettmeijer-Vermeulen and Esser 2017). She was not only not considered a victim of human trafficking but also faced criminal charges for manslaughter.
These examples show that, in practice, exploitation does not refer exclusively to obtaining profit but should also extend to situations in which the traffickers aim to obtain political utility or mere personal satisfaction (Hurtado et al. 2017).

**Human Trafficking**

“There is evidence that, particularly in the field of trafficking for sexual exploitation, many former victims are at some point offered the opportunity of recruiting new victims or serving as a ‘madam’” (UNODC 2016). That has been one of the explanations given for the high percentage of women convicted of human trafficking (Broad 2015; Siegel and De Blank 2010).

Sometimes female traffickers are pressured by male counterparts to recruit other women or otherwise engage in trafficking. They feel compelled to do so as a way of escaping their own situation of exploitation, in order to avoid situations of violence and abuse, or so as to repay their debt to traffickers (Broad 2015). In a case reported in Argentina, a criminal group used women who had been previously trafficked to recruit other victims from the Dominican Republic by means of deception regarding the working activities they would perform at the destination country. In this case, the court gave a lighter sentence to these women, since they recognized that they were victims themselves (UNODC 2016). However, this is not always like that. In these cases it is especially difficult to draw the line between victims and perpetrators. Discourses of perpetration and deviance are usually given more prevalence than experiences of victimization in criminal justice processes (Broad 2015).

**Specific Difficulties Related to Victim Identification**

Despite the express inclusion of trafficking for forced criminality in the definition contained in Directive 2011/36/EU, the identification of this crime is defective. A study that analyzed the identification of child trafficking for criminal exploitation in Lithuania, Norway, Poland, and Sweden reported that minors exploited in criminal activities get in contact with authorities repeatedly without being identified (Council of the Baltic Sea States 2013). As a consequence, prosecutions of traffickers are very rare. For instance, nobody in the UK has ever been convicted of trafficking people for the purposes of cannabis cultivation, although trafficking victims have been sanctioned instead (Burland 2017).

Victims of this crime are often not identified as such, but rather prosecuted as criminals (RACE 2014; United States Department of State 2014). On many occasions, they are completely invisible to law enforcement authorities until the crimes they have been forced to commit are noticed. Particularly in the case of shoplifting or pickpocketing, trafficked people perform tasks that are more exposed to criminal investigations, and therefore they are more likely to be caught and arrested than traffickers (Skrivankova 2018). For this reason, victims’ first contact with the professionals who can formally identify them usually occurs in a police station (or at the
airport in the case of mules), after they had been arrested (Villacampa and Torres 2017). In the absence of an appropriate protocol for the detection of these victims, they end up being punished for the crimes they committed during their exploitation. When trafficked people are migrants, they often face detention in immigration removal centers following the completion of a prison sentence with the strong possibility of deportation (Burland 2017).

Thus, human trafficking victims suffer a double victimization: one caused by those who trafficked and exploited them and another inflicted by the state. This institutional victimization has two aspects. On the one hand, the lack of identification means that the victims are deprived of the rights and protection granted by this status. On the other hand, to make matters worse, they are forced to serve sentences, including imprisonment, for crimes committed as a result of trafficking. In addition, the inability to identify victims means that traffickers continue to exploit individuals and benefitting from the criminal activities with impunity.

Several factors can explain the lack of identification of victims of human trafficking for criminal exploitation:

**Lack of Awareness and Prevalence of Stereotypes About Trafficking**

Firstly, since this modality of crime is new, there is little awareness of what it is, and victims are mistakenly viewed as having chosen to engage in criminal behavior (Sands 2018). Trafficked women serving sentences for drug crimes have reported that law enforcement authorities barely asked about their personal circumstances at the time they committed the offense so as to analyze if they had been trafficked or not, but rather focused on finding more people guilty of smuggling illicit substances (Villacampa and Torres 2015). Moreover, it is frequent that various different agencies in charge of identifying trafficking victims work with distinct interpretations of the definition of this crime (Council of the Baltic Sea States 2013).

Besides, when it comes to identifying victims, authorities are still too centered on sexual exploitation and on stereotypical constructions of ideal or innocent victims of trafficking, which undermines the successful identification of people trafficked for forced criminality (Burland 2017; Council of the Baltic Sea States 2013). A qualitative study carried out in Spain, in which 37 criminal justice professionals and victim service providers were interviewed, showed that “trafficking for criminal exploitation was only clearly identified as a form of trafficking in 15 of the interviews (40%)” (Villacampa and Torres 2017, p. 398). Therefore, if law enforcement authorities do not know what trafficking for criminal exploitation is, and are not familiar with its red flags, the vast majority of cases will remain unreported.

**Lack of Victims’ Self-Identification**

Especially in this modality of trafficking, victims do not self-identify as such (Sands 2018; Villacampa and Torres 2017). Stereotypical conceptions of what a trafficking victim should be also play a determinant role here. Many victims still understand
Trafficking as being “sold” and “taken,” usually by means of violence, and unless these elements are made obvious, they are unlikely to see themselves as trafficked people (RACE 2014, p. 76). Besides, trafficking victims, particularly children, may develop strong emotional links with their traffickers (Council of the Baltic Sea States 2013). This makes them experience a sense of protection, usefulness, and power that prevents them from realizing that they are actually being exploited.

Individuals trafficked to commit crimes not only are not aware of their status as victims but also perceive themselves as offenders (Villacampa and Torres 2017). Since they are aware of having participated in the commission of a crime, they are afraid of being detained and are unwilling to tell their story to the police due to shame or fear. This situation is exacerbated by traffickers, who may threaten victims with being reported to the authorities if they try to escape (Council of the Baltic Sea States 2013). Moreover, there is some evidence that traffickers train victims to “handle” contacts with the police, by instructing them to refuse to speak (Sands 2018, p. 5).

**Lack of Trust in the Police**

Their inability to express themselves as victims comes together with “a high level of fear and mistrust of the authorities and of the police, both in victims [sic] home counties and in destination countries” (RACE 2014, p. 76). The lack of trust in authorities is aggravated by their failure to recognize trafficking indicators, as explained above (RACE 2014).

Traffickers also contribute and take advantage of this situation. They tell the victims they will be punished because authorities will not identify nor assist them. They are also told that officials are corrupt and cannot be trusted. Again, victims assume these statements are true because “they have seen corruption first-hand or are aware of other victims who have been prosecuted for illegal entry or for other offences they may have been forced to commit as victims of trafficking” (Schloenhardt and Markey-Towler 2016, p. 23). They are, in sum, convinced that if they are identified, the victimization process will continue (Villacampa and Torres 2017).

For these reasons, it is crucial that law enforcement authorities who are in a position to identify victims of this form of trafficking are appropriately trained to look for the “crime behind the crime” (Skrivankova 2018, p. 116; United States Department of State 2014). In order to identify victims, law enforcement authorities need to be aware of the possibility of this type of trafficking existing, which is not often the case (Skrivankova 2018). Previous studies have confirmed that the number of victims identified increases when professionals receive training (Renzetti et al. 2015; Villacampa and Torres 2017). Moreover, it is important that they are familiar with indicators of this form of criminality. For instance, the following aspects have been suggested as examples of red flags that should be used to detect child criminal exploitation:

- Evidence of vulnerability
- Lack of supportive/caring adult
– Evidence of children moving between different locations
– Persistently going missing from school or home
– Regularly being found away from the home area
– Unexplained acquisition of money, clothes, or mobile phones
– Excessive receipt of texts/phone calls
– Relationships with controlling/older individuals or groups
– Leaving home/care without explanation
– Suspicion of physical assault/unexplained injuries
– Significant decline in school results/performance
– Self-harm or significant changes in emotional well-being (Sands 2018, p. 6)

Non-punishment of Victims of Human Trafficking for the Purposes of Forced Criminality

As we have seen before, individuals can be trafficked so as to be used and exploited in the commission of criminal activities. However, the risk of criminal offending linked to trafficking expands beyond this. Schloenhardt and Markey-Towler (2016) offer the following categorization of offenses that human trafficking victims may commit:

– Status offenses: These are offenses committed “as a direct result of their status in the place to or through which they have been trafficked” (p. 13). When trafficking involves the crossing of borders, victims are likely to enter, stay, or exit the destination country in violation of existing migration and border requirements and consequently could be apprehended and prosecuted for immigration-related offences. These offences committed in the process of being trafficked are also called “causation-based offences” (Villacampa and Torres 2017, p. 394).

– Consequential offenses: These are offences committed as a direct consequence of trafficking, because victims were coerced or forced by the traffickers to do so. The victims are used as instruments to commit crimes. The experiences mentioned in the above sections (drug trafficking offenses, property crime, violent crimes, human trafficking, etc.) would be included in this category. They may also be called “duress-based offenses” (Villacampa and Torres 2017, p. 394).

– Liberation offenses: These are offenses committed while trying to free themselves or trying to improve their situation. “In most cases, these offences would be directed against the traffickers, their associates, or their property, or involve offences committed to acquire weapons, other instruments, or documents needed to leave the trafficking situation and perhaps, the host country” (p. 15).

As stated before, punishing victims for any of the abovementioned offenses constitutes a double victimization: first criminally and then institutionally. For this reason, not punishing victims for trafficking-related offenses, particularly for consequential ones, is the most convenient answer from a criminal-political point of view. On the one hand, it would not be coherent to condemn the trafficker for the
recruitment, transportation, or receiving of an individual in order to exploit them in the commission of criminal activities and, at the same time, punish the victim too for the offenses they have been forced to perform. This is, in fact, one of the reasons behind the non-punishment clause: “even if a victim of trafficking deliberately commits an offence, they cannot be charged and prosecuted for that offence if they lacked true autonomy or agency at that time.” (Schloenhardt and Markey-Towler 2016, p. 19). The point is not offering blanket immunity to victims but balancing offenses committed against them with others committed by the victims (Schloenhardt and Markey-Towler 2016).

On the other hand, avoiding punishment serves as a way to enhance victims’ trust in the justice system. This way they will be more likely to exit the trafficking situation and cooperate freely with law enforcement authorities in the investigation and prosecution of traffickers (Schloenhardt and Markey-Towler 2016).

Aware of these advantages, some anti-trafficking legislation already foresees provisions in this line. Although the Palermo Protocol does not say anything in this regard, the United Nations Model Law against Trafficking in Persons (2010) recommends states the adoption of either non-liability, non-punishment, or non-prosecution of victims (p. 32).

– **Non-liability**: it is the broadest term. If adopted, criminal liability simply does not arise, that is, “offences committed by victims of trafficking are not illegal and do not require prosecution and punishment” (Schloenhardt and Markey-Towler 2016, p. 32). This provision is not used in any binding international instrument (Schloenhardt and Markey-Towler 2016).

– **Non-prosecution**: in this case, the offenses committed as a direct consequence of the trafficking situation would still be illegal, but prosecutors would refrain from pressing charges against victims. This option is foreseen in the OSCE Action Plan to Combat Trafficking in Human Beings, Decision 557/Rev.1, 7 July 2005. This provision impedes trafficking victims being held in detention centers or prisons at any time before, during, or after all civil, criminal, or administrative proceedings (United Nations 2010). It can be problematic in civil law jurisdictions where authorities have a duty to prosecute (Schloenhardt and Markey-Towler 2016).

– **Non-punishment**: it is the narrowest provision, according to which states only refrain from imposing penalties for the victim’s involvement in illicit activities they have been compelled to commit as a consequence of the trafficking situation. It is foreseen in the Council of Europe Convention on Action against Trafficking in Human Beings, as a possibility that states party should consider, in accordance with the basic principles of their legal systems (Article 26). Directive 2011/36/EU gives member states the possibility of choosing between non-prosecution or non-punishment, also in accordance with the principles of their legal systems (Article 8).

Despite non-prosecution and non-punishment clauses being widely adopted, victims of trafficking for the purposes of criminal exploitation continue to be punished. “In 24 out of 28 Country Reports, GRETA [Group of Experts on Action
against Trafficking in Human Beings] calls for the adoption and full transposition of non-punishment provisions, or calls for further steps to be taken to ensure its full Implementation” (RACE 2014, p. 77). In a study about people trafficked for cannabis cultivation in the UK, Burland (2017) provides several examples of real cases in which judges recognized that the defendants were “an example of modern day slavery,” and that they “had been used by others,” but they were nevertheless sent to prison (Burland 2017, p. 11–12). “Judges expressed sympathy and remorse for what they described as the desperate and sad circumstances of the defendants,” but “they lacked recognition and understanding of the possibility of the laws protecting the defendants they identified as trafficked and enslaved from being found guilty and sent to prison” (Burland 2017, p. 11).

Non-punishment provisions have also been outlined as a rationale for overturning convictions when it is subsequently demonstrated that those convicted were actually victims of trafficking for the purposes of forced criminality. The most paradigmatic case in this sense occurred in the UK in 2013 (L, HVN, THN, and T v R). In this case, three convictions of minors for drug-related offenses and one conviction of a woman of legal age for possession of false identity documents were annulled, given that these individuals had been victims of trafficking and that the criminal activities committed were integrated into the exploitation suffered. The court considered that, when assessing whether the offenses committed by the victims are part of the exploitation situation, it is not necessary to be prescriptive, and three types of situations must be distinguished:

1. In the first place, there will be cases, such as those of the judgment in question, in which the facts will show that the trafficked person acted under duress (“under levels of compulsion”) and guilt will be completely extinguished.
2. In other cases, culpability decreases but does not disappear, so that only the application of some mitigation will proceed. In order to reduce or eliminate the guilt, it will be necessary to take into account not only the age (a relevant factor in the case of minors) but also the fact that the victim had no realistic alternative other than obeying the mandates of the trafficker. It is important to note that this second criteria is but one of the elements of human trafficking: the existence of a situation of vulnerability that is abused by the trafficker.
3. Finally, on certain occasions the commission of crimes does not arise from victimization, and therefore, immunity would not proceed at all.

These criteria used by the British court could be useful to shed light on the application of non-punishment principles in practice, since there is not yet a uniform criteria recognized in international law or widely adopted in national legislations (Schloenhardt and Markey-Towler 2016). Different texts use different expressions in order to establish a causal connection between the offenses committed and the position of the victim (Schloenhardt and Markey-Towler 2016). Therefore, it is not clear whether leniency affects only consequential offences or also status and liberation ones. The United Nations Working Group on Trafficking in Persons (2015) stated that “in practice [. . .] it appears clear that crimes committed incidentally in the
course of an individual’s exploitation are more readily overlooked than crimes committed as a direct manifestation of the exploitative purpose, particularly where there is some indication of possible consent in the latter case. In such cases the threshold for disregarding apparent consent appears to be higher and courts have been less willing to accept broad interpretations of subtler means (such as abuse of a position of vulnerability) as a justification for disregarding apparent consent to involvement in criminal activities” (p. 7).

**Conclusion**

- The definition of human trafficking provided by the Palermo Protocol has been broadened by more recent anti-trafficking instruments to include, among other changes, new modalities of exploitation, such as forced criminality.
- Human trafficking for the purposes of forced criminality can be defined as the recruitment, transportation, transfer, harboring, reception, exchanging, or transferring of control over a person, using coercive, fraudulent, or abusive means, in order to exploit them by forcing them to commit criminal activities.
- According to Directive 2011/36/EU, forced criminality should be understood as the exploitation of a person to commit, inter alia, pickpocketing, shoplifting, drug trafficking, and other similar activities which are subject to penalties and imply financial gain. It is contested whether forced criminality can also include offenses that do not necessarily yield economic benefits, such as murder, terrorism, or participation in armed conflicts.
- A review of existing literature on this form of criminality shows that adults and children are trafficked for the purposes of being exploited in drug production, particularly cannabis cultivation, drug smuggling, and distribution, as well as property crimes such as pickpocketing, shoplifting, and counterfeiting. Some studies highlighted that individuals can also be trafficked to commit violent offences, including killing, kidnapping, or planting landmines. Finally, it is also common that victims of trafficking for the purposes of sexual exploitation are forced to recruit new victims.
- The identification of human trafficking for the purposes of forced criminality is still defective. This is mainly due to authorities’ lack of awareness of this modality of trafficking, prevalence of stereotypes about trafficking, victims’ lack of self-identification as such, and lack of trust in the police. Training and capacity-building plans for authorities in a position to identify victims are much required in order to improve this situation.
- Victims of human trafficking for forced criminality are often punished for the offences they have been compelled to commit. Thus, they are doubly victimized: firstly by the traffickers and later on by institutions, which do not give them the protection their victim status should grant.
- Many anti-trafficking legislations include either non-prosecution or non-punishment provisions, according to which states can refrain from pressing charges or imposing penalties for victim’s involvement in illicit activities they had been
compelled to commit as a consequence of the trafficking situation. However, judges still lack awareness of the possibility of applying them. Further steps need to be taken in order to ensure their full implementation.

Abstract

There is a worldwide shortage of body parts. This shortage leads to the patient’s willingness to pay high sums of money for body parts, especially organs. Criminal organizations – in cooperation with staff members of the healthcare sector – do lucrative business with the trade of body parts, especially with the offence on human trafficking for organ (cells and tissue) removal.

This chapter describes the international legal documents and regulations to combat human trafficking for body part removal, and characterizes the offenders and victims, thereby focusing on the health issues related to organ transplantation (especially in cases of organ tourism) and on the problem of victim identification. The chapter concludes with preventative approaches.

Keywords

Human trafficking for organ removal · Healthcare professionals · Organ transplantation · Transplant tourism

Organ (Cells and Tissue) Removal – An Exploitative Form of Trafficking of Human Beings (THB)

The transplantation of human body parts, especially of organs, but also of tissues and cells, is a significant achievement of modern medicine that has saved or substantially improved, many lives. However, the possibility of transplantation from live donors and donors after brain death also carries risks. Transplantation needs an increasing number of human body parts, but organs, and, to a lesser extent, tissues and cells, are not always readily available.

The gap between supply and demand of transplantable body parts, especially organs, is vast and still increasing (see section “Conclusions: Strategies for Preventing Human Trafficking for the Purpose of Organ Removal,” excursus), which makes humans and their body parts an easily identifiable and profitable business for
criminals, particularly those involved in organized crime. Patients have to pay a great deal of money to obtain their needed organ or body part, resulting in an enormous black market for organs, cells, and tissue that has emerged over the years. An article in an Austrian newspaper (*Der Standard*, 2009), succinctly characterized the problem: Although organs for transplantation are scarce, anyone with enough money can get any organ they desire (Author’s translation).

Human traffickers, therefore, gain profits by recruiting victims to exploit as “human spare parts depot” (Rugemer 2010). Organ removal is a specific type of exploitation within the broader offence of human trafficking and is penalized under international legal frameworks and most national criminal legal acts.

Usually, human trafficking for organ removal is only mentioned in the context of living organ donation. However, the last Report of UNODC (2016) reported cases of organ-extraction from deceased THB victims (refugees) (see section “Cases of Human Trafficking for the Purpose of Organ Removal”).

Organ removal is mentioned under the illegal purposes of human trafficking because the removal of an organ without consent freely given, based on comprehensive information, is a severe violation of physical integrity and human dignity (recital 11 Directive 2011/36/EU, see also Andorno 2017). A person’s right to make decisions about their own body is breached; it is an extraordinary violation of human rights (see also section “The Criminalization of THB for Organ (Cells and Tissue) Removal on the International, Supranational, and National Levels,” excursus).

The removal of tissues and cells is often not mentioned explicitly as a type of exploitation in international legal documents. When – in individual cases – the removal of tissues and cells constituting an effective intervention, comparable to organ removal, is accompanied by a fundamental violation of human dignity, it can be considered as a form of exploitation of human trafficking (see also section “The Criminalization of THB for Organ (Cells and Tissue) Removal on the International, Supranational and National Levels”). In such cases, the following statements apply to the removal of cells and tissue.

---

**The Criminalization of THB for Organ (Cells and Tissue) Removal on the International, Supranational, and National Levels**

**United Nations Convention**

The first mention of organ removal within the context of THB and its criminalization at the international legal level is in Article 3(a) of the Protocol to Prevent, Suppress and Punish Trafficking in Persons of the United Nations Convention against Transnational Organized Crime and the Protocols Thereto (see UNODC 2009). It states, that “trafficking in persons” shall mean:

> “the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the
abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs”.

A closer look at the UN definition of trafficking in persons shows that recruited victims can be transported as donors to another country or within their home country. Harboring or recruiting donors, where the person is not transferred, but the organ recipient is brought to the donor, is seen as human trafficking for the purpose of organ removal. The means used to recruit the donors are all forcible or deceptive; under all such circumstances, the donors cannot choose to donate an organ based on free will.

Excursus: Importance of Free Will in the Context of Transplantation

In the context of organ donation, the free will of the donor is of paramount importance. Legally and ethically, a patient has to give their informed consent for medical treatment. This is particularly so concerning organ removal. The Guiding Principles on Human Cell, Tissue and Organ Transplantation (2010) of the World Health Organisation (WHO) requires, in its Principle 3, that a person must donate “free of any undue influence or coercion.” In other words, trafficking is not an acceptable means of acquiring donor organs (see also the Directive 2010/45/EU of the European Parliament and of the Council of 7 July 2010 on standards of quality and safety of human organs intended for transplantation; The Declaration of Istanbul On Organ Trafficking and Transplant Tourism 2018).

Council of Europe Convention

The UN definition served as a model for the Council of Europe Convention on action against trafficking in human beings, which also mentions the removal of organs as a possible exploitation in Article 4.

European Union Directive

The European Parliament and the Council followed on from Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims, both previously mentioned Conventions, and involved victims of trafficking for organ removal in Article 2. The previous act, the Council Framework Decision on THB from 2002, had not mentioned this kind of exploitation.
Children as a Particular Victim Group: United Nations Optional Protocol

The Criminalization of Cell and Tissue Removal in Single Cases Made Possible

As mentioned, the removal of cells and tissue as part of human trafficking is not explicitly included in legal frameworks. Only the most common exploitation methods are listed; due to the wording, and it is a nonexhaustive, exemplary list (“exploitation shall include at a minimum…”). This means the removal of cells or tissue can be an additional form of exploitation. This is the case if the intervention to remove cells and tissue is deemed comparable to organ removal. In some cases, the involuntary donation of these body parts can be seen as a profound violation and exploitation. Furthermore, if the other preconditions are fulfilled – namely, an illegal act and means have occurred – then the crime of human trafficking for cells and tissue removal has been committed.

Criminalization in National Legal Documents

According to (these) inter- and supranational legal documents, the state parties, ratified member States, and third parties are required to implement legislative and practical measures to establish human trafficking for organ removal as a criminal offence. Apart from the explicit sanctions on trafficking human beings for the removal of organs, offences such as bodily harm, homicide, or offences against personal liberty also play a role in the context of criminalizing THB for organ removal. Where organs are removed from deceased donors, necrophilia might come into question as a punishable criminal legal offence.

Limited Availability of Data

Even though “typical situations” and some single case studies (see section “Cases of Human Trafficking for the Purpose of Organ Removal”) are known, and research on the topic and media awareness are increasing, there is little data available on THB for organ removal.
Between 2007 and 2012, 100 cases of THB for organ removal were reported to the United Nations Office on Drugs and Crime (UNODC) by 20 countries (UNODC 2015). In the following 2 years to 2014, UNODC announced that 12 countries had detected 120 victims (UNODC 2016). A slight increase is thus recognizable.

In 2016, 1% of all human trafficking cases worldwide were for organ removal. Ten countries indicated such cases. North Africa and the Middle East were particularly affected; 3% of the THB victims were trafficked because of organ removal. In Central and Southeast Europe, 0.1% were victims of this exploitation type (UNODC 2016; see also UNODC 2015). The majority of victims (82%) were male, young and of low education (UNODC 2015) (see section “What We Know About the Victims”).

According to a report by the International Organisation for Migration (IOM 2017), refugees are affected by THB for the removal of organs and other body parts. Less than 2% of refugees on migration routes to Europe (during the so-called “refugee crises”) reported knowing of people forced to give organs and blood or other body parts against their will, mainly in Libya, but also in Egypt and Bulgaria.

These findings are just the tip of the iceberg; the vast majority of cases remain unreported because the victims are difficult to identify (see section “The Challenges in Trying to Identify the Victims”). The number of accusations and convictions is also deficient, as in all THB cases, because police, prosecutors, and courts are faced with various challenges when investigating and judging THB cases (HOTT Project n.d.). There is also the problem that trafficking takes place cross-border, even cross-continent (UNODC 2015; HOTT Project n.d.). Moreover, the crimes “human trafficking for organ removal” and pure “organ trafficking” are often confused or mixed up, making proper data collection impossible.

Differentiating “Human Trafficking for the Purpose of Organ Removal” from “Organ Trafficking”

We must differentiate “organ trafficking” from “human trafficking for organ removal” because they are two different and distinct criminal offences. When used in political and academic discourse, we confuse the terms, and they can merge into one. (Bruckmüller 2014; Stanojoska and Nikolova n.d.; UNODC 2015). While we acknowledge that these types of offences can sometimes overlap, it is vital to maintain their distinction for prosecution and the support of victims.

Human trafficking for the purpose of organ removal encompasses situations, as mentioned above, in which a person is recruited as a victim – usually under false pretenses or by violent means – and transported to a clinic (usually outside their country) to be subjected to organ removal. In this case, the persons themselves are the object of the trade.

In the cases of organ trade and body parts trade, the organs, cells, tissues, or other body parts are the object of the trade. Organ trafficking can be defined as a contractual agreement concerning implanting body parts into patients as a medical treatment for profitable ends. The donor gives the organ – in most of the cases voluntarily – (while living or promising the organ after death). Thus, from a legal
perspective, free will is still involved, even if the donor decides under duress or, for example, based on financial pressure. The recipient (illegally) pays the donor or the body parts dealer a high sum. This is also – in most countries – a crime because, for ethical reasons, organs are not allowed to be sold (e.g., see The Declaration of Istanbul on Organ Trafficking and Transplant Tourism 2018).

Sometimes the offence of “organ trading” and that of “human trafficking for organ removal” overlap, for instance, in cases where the offender commits both crimes (e.g., by not only recruiting the victim but also selling the organ to the recipient). This overlap also occurs in cases where the donor wishes to sell an organ but, in the course of finding a recipient or a medical institution, they are recruited by a trafficker and do not receive the agreed medical care or the agreed payment (UNODC Toolkit).

**Why Is Understanding the Differentiation Important?**

Although in practice, the distinction between “organ trade” and “human trafficking for the purpose of organ removal” may not always be discernable in every case, the distinction must be made because of the “criminal legal status” of the donor.

In an organ trade case, the donor – according to most national criminal codes – is an offender. If the offender illegally takes money for the organ, they are committing the crime of “organ trading.”

On the other hand, if a donor is recruited and exploited by a trafficker, they are a victim of human trafficking (although their organ is part of an organ trade). As a victim, they must be granted comprehensive victims’ rights and support.

In cases of THB, where the donor is a victim but receives money (even if this is less money than agreed), then from a legal perspective, the “victim” may not be seen as only a victim of THB. The victim becomes an offender in the organ trade because they earn money for their body part. In such incidents, the person can be called a “victim-offender” (Bruckmüller 2006; Bruckmüller and Schumann 2012; Bruckmüller and Schumann 2016). International legal frameworks (e.g., the UNODC nonbinding model law on THB, the binding legal frameworks at the European level, and some national, mostly criminal procedure, codes) stipulate that the offence of organ trade committed by a victim of THB within an exploitation situation should neither be prosecuted nor punished. This is known as the “non-punishment rule” (see, e.g., Article 22 of the Directive 2011/36/EU) (Bruckmüller and Schumann 2012; Bruckmüller and Schumann 2016; Bruckmüller 2017; Jovanovic 2017).

**Cases of Human Trafficking for the Purpose of Organ Removal**

**Typical Cases of Living Organ Donation**

Typical situations involving human trafficking for the purpose of organ removal may be as follows: A victim is brought on false presumptions to a clinic for a living organ donation. Either the organ recipient is brought to the same clinic as the donor
(such as in cases of “organ tourism”), or the organ is removed and then transported to the hospital (sometimes in another country) where the recipient is to be implanted.

In most cases, the donors are tricked into taking a well-paid job abroad, and so are tricked into coming with the offender. There are also cases in which the victims know that they will be donating an organ but the offender lies in terms of the medical care the victim will receive before and after the transplant. While proper medical treatment is promised, in reality, most donors do not receive any medical help or support before or after the procedure. It is also common for victims who at first decide freely to donate an organ but wish to withdraw later, to be forced to go through with the operation. Typically, victims are defrauded because of the money; sometimes they get less than promised – mostly they get little to no money (UNODC 2015; Europol 2010; HOTT Project n.d.; Budiani-Saberi & Delmonico, Budiani-Saberi and Delmonico 2008).

Examples of Reported Cases by Human Trafficking Victims to Live Organ Donation

One victim’s court statement revealed how the victim, a male, needed money for his education and healthcare for his father. Seeing an advertisement offering money for a kidney, he contacted the e-mail address given. He was promised 10,000 euros for a kidney but did not read the contract he was given to sign. The kidney removal was conducted in a big city clinic, not in his hometown. When he left the hospital, he did not receive the full amount of money agreed. He was later contacted by the person who had made the arrangements, offering to pay him what he was owed and extra money for every person he recruited for kidney donation. When he refused, his life was threatened (UNODC 2015).

Another reported case is that of a South American migrant to Europe with a big family and only able to speak his native language. He was involved in a car accident, and when he was having the car repaired, a police officer asked him how he intended to pay, while, at the same time, offering a way to get the money he needed: sell an organ. Transportation to South Africa, where the transplant was to take place, was organized. He was made to sign consent forms, including a statement that he was related to the donor. He was not informed about the specifics of the operation, the potential risks, or the safety measures necessary afterwards. On the contrary, the surgeon told him there were no risks. He was paid US$5000 but was made to sign a form stating he had received US$7500 (UNODC 2015).

Reported Cases of Organ Removal from the Deceased

THB for organ removal is concerned with organ removal from living persons. However, cases of organ removal from deceased persons were reported in the last UNODC Report (2016). This is a phenomenon that has come into focus with the
increased flow of refugees into Europe. The report revealed that migrants from Eritrea were kidnapped along with their route and forced into work or other situations of exploitation, and tortured. While being tortured, they had to call their family to ask them to pay a ransom. When the family could not pay the money, the captors killed the refugees and removed their organs. The organs were sold for around US$15,000 each.

**What We Know About the Offenders**

Various actors participate in the trafficking of persons. Offenders are mostly male; the ratio is 63% male to 37% female traffickers overall in the regions of eastern Europe and Central Asia. In Central America and the Caribbean, the majority of offenders are female (UNODC 2016).

Concerning THB for organ removal, the field of persons involved is considerably extended compared to typical single and organized crime offences; healthcare professionals are offenders in this field and, further still, there are offenders from other professions (UN.GIFT 2008; Europol 2011; UNODC 2015).

**The Role of Medical Professionals and the Involvement of Clinics**

Due to the nature of organ removal for transplantation, along with typical criminal actors, the medical and nursing staff of clinics and laboratories become offenders (UNODC 2008, 2015). Notable professions involved are transplant surgeons, anesthetists, and nephrologists. To assist during the operation and for post-operative care, nurses and other assistants are also required (OSCE 2013).

The role of medical actors requires further scrutiny. Without them, organ donation and therefore THB for organ removal would be impossible. Little is known, however, about their involvement. In particular, surgeons who perform illegal operations do not seem to be indicted and are less so convicted. There have been very few convictions of medical professionals involved in the trafficking of persons. One explanation is that their profession is held in high esteem (UNODC 2015; HOTT Project n.d.). Another reason might be that many medical and especially nursing staff members act unknowingly, meaning they have no idea about the circumstances of the transplant if they are not in direct contact with the donor. This lack of knowledge is particularly real for health facilities, such as laboratories, where blood and other testing is conducted, and for administrative staff in healthcare facilities responsible, for example, for transplant coordination (OSCE 2013; UNODC 2015). If the recipients or staff meet and treat the donor, they are not able to identify this person as a victim (see section “The Challenges in Trying to Identify the Victims”), and therefore without knowledge, they are not acting with intent. Moreover, intent often cannot be proven in criminal proceedings.
Other Actors Within the Healthcare Sector

Other actors, such as pharmaceutical companies, might play their part in THB for organ removal (UNODC 2015). In single cases, medical insurance agents and patient advocacy organizations are also part of the trade, or even travel agencies specialized in medical tourism. The so-called “transplantation tourism” plays an important role because travel agencies offer “all-inclusive” travel packages with travel and hospitalization costs and/or body parts included (Broumand and Saidi 2017; Shimazono 2007; Bos 2007; Zöch et al. 2010; UN.GIFT 2008; Rugemer, Rugemer 2010; Europol 2011; see also The Declaration of Istanbul On Organ Trafficking and Transplant Tourism 2018). If they know of the organ’s origin and the sourcing procedure, then they have the intent to commit a crime.

Organized Criminality Involved

A high level of organization is required to bring a donor organ and recipient from different countries, often different continents, together in a clinic successfully. Hence, organized crime networks are also actively involved in this kind of human trafficking (UNODC 2008, 2015; OSCE 2013). The organized crime “chain” usually starts with local brokers, the ones making direct contact with the future donor (OSCE 2013). They are very skilled at identifying vulnerable individuals and persuading them to sell an organ; they may even be from the same background, a friend or relative, or former victims of THB for organ removal (UNODC 2015). There is little data available about the detailed structures of the organizational networks and the international coordinators within organized crime.

The “Appeal” to Commit THB for Organ Removal

As noted above, reliable data on organ trafficking is quite limited. Studying the phenomenon is further compounded by the challenge of finding and identifying persons who have been victims of organ trafficking. As a result, law enforcement agencies report only a low detection rate. It is the low detection rate, in combination with the high profit to be gained by trafficking persons and exploiting them for their organs, that makes this kind of offence so attractive for offenders and organized crime networks. Recipients have been known to pay up to US$200,000 for a donor organ (UNODC 2015; UNODC, n.d.), with the largest share of the money going to the traffickers, which makes it a very promising enterprise.

Recipients as Offenders?

Finally, yet importantly, the recipient of an organ can be a THB offender, if they know all the circumstances surrounding the organ provenance and have the intent to
take the organ of a THB victim. However, it is unclear how much a recipient would know about the donor’s situation and the transplant proceedings. The recipient may believe – or even be made to believe by the traffickers – that the donor has given his free consent, received adequate medical care, and has been paid accordingly. Even if a recipient is aware of organ trafficking when going to another country for the transplant, they might not conclude they are part of a human trafficking scheme. In any case, recipients’ motivation, knowledge, and decisions would have to be assessed individually (UNODC 2015). Another aspect also needs to be considered, namely, how urgent is the medical need of the recipient and, in most of the cases, if the victim is confronted with impending death. Therefore, in proceedings so far, recipients have usually been treated as witnesses and not as offenders (OSCE 2013).

What We Know About the Victims

Typical Characteristics of Victims

While it is difficult to identify any distinct characteristics associated with THB victims for organ removal, specific attributes can be discerned despite data scarcity. They are usually young, around 30 years of age, poor, and not well educated. The age can be explained by the market’s desire for organs from young, healthy people (UNODC 2015); the recipients hope such organs have a higher chance to be accepted.

Gender is another unique characteristic. Where victims of THB for other purposes, like sexual exploitation, are mostly female, the majority of victims of THB for organ removal are male. Of those trafficked for organ exploitation, 82% are either men or boys, while women and girls account for only 18%. Considering the whole THB picture, 1% of all male victims are trafficked for organ removal, and 0.1% are females (UNODC 2016).

At the time of preparing this chapter, persons fleeing from conflict situations, as was detected during the so-called refugee crisis (see sections “Limited Availability of Data” and “Cases of Human Trafficking for the Purpose of Organ Removal”), are another vulnerable subgroup endangered for organ exploitation (UNODC 2016; IOM 2017).

Based on the findings mentioned above, it is clear that young men from a poor background and with low education make up the majority of victims.

Staff members of law enforcement agencies and the healthcare sector involved in victim support and crime prevention should be aware of this specificity of THB for organ removal. In the context of refugee movements, particularly staff members of NGOs and victim support organizations as well as volunteer helpers should know this data.

Poorly Educated Victims – The Problem of Informed Consent

The victim’s situation – here especially the low education standard – makes him an easy target for traffickers. Information on planned organ removal must always be
provided in such a way that is understandable, to enable the donor to make an informed decision. For medical treatment not in the immediate interest of the patient, information must be even more detailed and thorough, particularly on the reasons against committing to the treatment. These essential legal and ethical requirements of medical treatment are severely neglected in the case of human trafficking for organ removal. The victims do not know about their rights as patients and are not informed of them by THB perpetrators. People with low education might not know or understand the dangers accompanying an operation for organ removal, the potential problems during recovery, and the possible long-term effects, and can thus be more readily persuaded to agree to the operation and the loss of an organ. They might be unaware of what they are doing when signing the agreement, irrespective of whether it is written in a language they know or not. Even if they ask questions, they can be lied to or coerced into cooperation. Moreover, people needing money are more likely to believe that donating an organ is a fast and easy way to acquire funds.

**The Challenges in Trying to Identify the Victims**

Identification of victims of human trafficking is difficult; this is also true of victims for organ removal. In common with other exploitation forms, these victims are pressurized by the traffickers, and thus they are afraid to go to the police. Moreover, they usually do not trust the police or other authorities. Language problems must also be mentioned. Especially in situations where victims might be “organ trade” offenders (see section “Differentiating ‘Human Trafficking for the Purpose of Organ Removal’ from ‘Organ Trafficking’”), when they receive money – even if it is less than agreed upon – for the organ, they do not dare go to the police because they are afraid of punishment and criminal legal sanctions. Moreover, police usually treat them as offenders and completely overlook the fact that they are also victims (Bruckmüller and Schumann 2012; Bruckmüller and Schumann 2016; Bruckmüller 2017).

To raise identification rates, sensitization of law enforcement officials are required to enable them to recognize victims of THB even if they encounter them primarily as offenders. Law enforcement must, at the very minimum, try to interview the persons about the circumstances and contact a specialized victim support organization. With the least suspicion, they are facing a victim of THB. In the healthcare sector, specially trained persons are also needed who, in suspected cases, can identify a possible victim and consult support organizations. This is because victims regularly fail to disclose information on their victim status to medical doctors or nursing staff they meet in the clinic. They do not know whom to trust, who is an offender, and who is just an unconscious participant in the illegal transplantation process (UNODC 2008; UNODC 2015).

Even after the operation, victims are often not detected as such by the healthcare sector. The people concerned usually do not visit a doctor even if they require urgent medical care. This is mainly for financial reasons, but also because they feel ashamed.
This results in health problems for the donors (see “The Challenges of Human Trafficking for Organ Removal: Victims’ (and Recipients’) Health Problems”).

In the context of possible THB cases for organ removal, healthcare staff and law enforcement agencies during criminal proceedings must keep an eye on the consent forms victims are given to sign. They should be aware that such documents are often not signed voluntarily. The lack of a consent form is also indicative of a forced donation (UNODC 2015; see also section “What We Know About the Victims”).

The Challenges of Human Trafficking for Organ Removal: Victims’ (and Recipients’) Health Problems

They have to leave the hospital only a few days after the organ removal, without being given adequate information on the operation, postoperative care, or the support needed in everyday life. Often from poor backgrounds (OSCE 2013), donors usually lack the financial means to consult local healthcare providers (UNODC 2015). Sometimes they are too ashamed to go to a doctor. Subsequently, health problems as a result of the organ donation are regularly reported by identified victims.

In some cases, however, victims and recipients have health problems after a THB organ transplant. Outside of the legal requirements and medical screening covering security, compatibility, and transportation, the quality of the organ and the transplantation procedure may differ from the safety norms required for the recipient (see, e.g., Directive 2010/45/EU). Documentation on such illegal transplantations, especially in the context of transplantation tourism, is not usually available. Doctors and nurses providing aftercare in problematic cases thus do not have the information necessary to guarantee adequate medical treatment.

Support for Identified Victims

If victims are identified, they need comprehensive support, in addition to victims’ rights and practical support measures (such as secret accommodation or assistance in returning to their country of origin, and adequate medical support, which is an additional requirement in organ removal cases (see Purkayastha and Yousaf 2019). Where needed, psychological support must be on hand. Such operations – mostly unwanted – and the fear of future health problems can be traumatic for victims.

Conclusions: Strategies for Preventing Human Trafficking for the Purpose of Organ Removal

On both the national and international level, preventative measures and identification approaches need to be implemented. They include, among other factors, the following.
Reducing the Problem of Organ Shortage

Reducing the need for organs would be the first step. States should strive to optimize organ donation by legal and practical measures; Spain and Austria are good examples with high organ donation rates based on the “dissent solution” (detailed below).

Excursus: Reasons for Organ Shortages

As the demand of organs is high, there is an organ shortage at a time when more people need them due to modern ways of living, growing human longevity, and disease (National Academies of Science, Engineering, Medicine, 2017; Saidi and Hejazii Kenari 2014; Campbell and Davison 2012). At the same time, developments in the medical field have allowed for an increase in successful transplantation numbers (Commission of the European Communities 2007). Today, transplantation can be performed on a much more full range of different organs and other body parts, for example, hands and faces, which is more than could be transplanted just a few years ago. Medical and technological development, however, cannot prevent people from dying due to not receiving a donor organ on time (Bruckmüller 2014). So-called “waiting lists” for organ transplants are long.

An estimated 15–30% of patients on waiting lists die before they can receive a donation (Council of Europe 2003; Eurotransplant 2011; United Network for Organ Sharing 2017). At the beginning of 2018 in the EU alone, around 14,000 patients were waiting for a transplant (Eurotransplant 2011). The same is true for the USA, where about 114,000 people were wait-listed in mid-2018 (United Network for Organ Sharing 2017).

Conversely, organizational and practical circumstances in healthcare systems affect low numbers of organs (especially of deceased). Insufficient space, especially a free room, and staff as well as machines capacities for transplantations in hospitals must be mentioned, because in hospitals with these requirements more organs can be explanted and/or implanted (European Union 2009). In most regions however, there are not enough teams for the determination of brain death. Meanwhile, for live donations, there is in a lack of general insurance coverage for cases involving during and after a transplant operation is a decisive factor in some countries.

Besides these organizational factors at hospitals, legal factors are also responsible for the low number of body parts available (Bruckmüller and Schroth 2015).

In the case of living organ donation, there are strict legal preconditions to protect the donor. This is important from an ethical and patient autonomy standpoint. Living organ donation is regularly limited to certain groups, for example, close family members, in most national legal acts. However, the lower the number of people allowed to donate, the smaller the number of organs available for donation.

Another factor for legal consideration is the number of post mortem organs, the so-called “consent solution,” applicable, for example, in Germany, Switzerland, and
the United States. This opt-in solution allows an organ to be removed only if the potential donor has given consent during their lifetime. As the practice shows, fewer people are willing to agree to their organs being taken after their death.

The so-called “dissent solution,” an opt-out approach in force, among other things, in Austria, Belgium, and Spain, results in higher numbers of organs being available for transplant. This is the case because, under certain necessary conditions, removal of the deceased person’s body parts is generally permitted. If somebody does not want to be an organ donor, they have to object during their lifetime.

- States need to provide more money for clinics to enable the organizational and structural conditions for transplantations. The staff members should be well trained in transplantation processes.
- States should force legal changes; living organ donation, in particular, should be legally regulated in a way that extends the pool of persons allowed to donate as far as possible, while at the same time including sufficient protection for the living donor. Regarding the removal of organs from the deceased, the dissent-solution should be given precedence (Bruckmüller and Schroth 2015).

Raising Awareness in Cooperation with Healthcare Staff

As in all types of THB, an important step is to raise awareness of the crime so that people vulnerable to exploitation, and organ recipients, are familiar with the issues involved.

- Doctors and other actors in the healthcare system should be included in awareness-raising campaigns, along with typical participants like government officials, law enforcement, and the public. Information should be given about possible health problems after an illegal organ transplantation process, especially those connected with medical tourism (UNODC 2008; UNODC 2015).

Increasing Identification Rate

As described above, identifying victims is a problem in itself. Here, medical and nursing staff can contribute to identifying possible victims and protecting them from involuntarily donating an organ.

- When dealing with potential donors, specific rules should be adhered to by expert staff. Patients should always be thoroughly informed on the procedure, the risks attached, and the alternatives available for the recipient. It should be a priority for the donor to have all the necessary information to allow them to make an informed decision in compliance with ethical and legal rules. In this context, signing the consent form in the presence of a medical doctor is explicitly mentioned as one
possible way of reducing forced donations (UNODC 2015). This would, however, presume that said medical doctor is not part of any trafficking scheme.

- To identify a possible victim in an unclear case, the person should be interviewed compassionately. This means that staff in both healthcare and law enforcement should be trained to ask a potential victim in a supportive way and under comfortable circumstances. They also should call in a specialist from a victim support organization as and when necessary. The interviews with the potential victim will ascertain if they are a victim. UNODC and other regional victim organizations provide a questionnaire guideline (UNODC 2008). This includes, among other things, questions on the personal background of the donor, their recruitment, transportation, the medical procedures involved, and payment.

This would help in two ways: (1) victim status can be identified and (2) better insight can be gained into how trafficking networks operate (Bruckmüller and Schumann 2012; Bruckmüller and Schumann 2016; UNODC 2015).

**Adequate Legal Rules and (International) Cooperation of Law Enforcement Authorities**

- Enacting transparent legal regulations on organ transplantation and making organ removal a clear criminal offence within THB could also impede illicit activities. Such regulations should enable the traffickers to be prosecuted more efficiently. Thus, states need to reinforce their cooperation with each other, as trafficking is a cross-border problem (UNODC 2015).
- The legislation, however, should also consider victim support and victims’ rights for particularly vulnerable victims to THB for organ removal and prevent secondary victimization.

**Reducing the Risks of Becoming a Victim**

Reducing the reasons why people are vulnerable to becoming victims of trafficking for organ removal is paramount.
- This can be achieved by reducing poverty; communities most prone to falling victim to traffickers should be the primary targets of prevention programs.

Abstract

Child trafficking for labor exploitation is one of the worst and most invisible forms of human trafficking. Moreover, this specific form of trafficking is intertwined with other phenomena ranging from forced child labor to broader concepts like child labor and child work. The convergence of factors related to child trafficking for labor exploitation not only complicates efforts to regulate child work and criminalize forced child labor and child trafficking for labor exploitation, but it also hampers attempts to establish adequate and effective preventive measures. This chapter aims to unravel this complexity in three steps. Firstly, child work is defined as a comprehensive term that includes work legally undertaken by children as an economic activity. Secondly, the term child labor is defined as a concept that encompasses diverse categories of work prejudicial to children. These categories, based on specific conditions of work, differ in seriousness, and the International Labour Office (ILO) has classified forced child labor and trafficking for labor exploitation as two of the unconditional worst forms of child labor. Thirdly, these two graver forms are explained

with emphasis placed on two special circumstances: the specific role of consent when children are the victims of forced labor and the progressive approximation of these two different concepts as a necessary strategy to effectively combat the exploitative situation.

Introduction

Addressing labor exploitation of children requires defining diverse concepts and situations, each of which carries a different degree of seriousness. In this introduction, four concepts are briefly defined, and the subsequent sections elaborate on each concept in more detail. The first concept, child work, applies to children at work in an economic activity. The core of this definition lies in the meaning of economic activity since the adoption of the System of National Accounts production boundary excludes domestic chores undertaken by minors in their own households. As will be shown, this exclusion could be problematic, because such domestic chores could also be omitted from the definitions of child labor, forced child labor, and child trafficking for labor exploitation. The second concept, child labor, is defined as all work that deprives children of their childhood, their potential, and their dignity and that is harmful to their physical and mental development. In practice, the elements which could turn child work into child labor include the child’s age, the nature or conditions of the work, or being engaged in any of the identified worst forms of child labor. Although the International Labour Office (ILO) has established a minimum age to work, distinguishing between light work (permitted above a determined age) and hazardous work (not permitted to minors) is indeed a controversial question which poses some difficulties, especially regarding the establishment of a universally accepted age for accessing to work. The third and fourth concepts, forced child labor and child trafficking for labor exploitation, respectively, fall under the (unconditional) worst forms of child labor. The ILO refers to forced labor as all work or service which is exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily. This definition underscores two core elements: coercion (menace of a penalty) and involuntariness. The special feature of forced labor when victims are children is that coercion can be applied directly to the child or to his/her parents; in this realm, it should be considered that, according to ILO definitions, the person imposing forced labor should be someone other than the child’s parents. The fourth concept, child trafficking for labor exploitation, constitutes a process during which three stages can be distinguished: recruitment, transport, and purpose of exploitation. What binds these stages is the act of taking control over another person with the objective that he/she will be exploited afterwards. When victims of trafficking are children, their consent is irrelevant, so no special means will be required to recruit the child. Even though the exploitative situation is often not considered when defining the concept of trafficking, recent trends advocate for including the exploitation itself in the general definition of human trafficking.
Child Work

It is necessary to first define child work (or children in employment), in order to understand related concepts of child labor, forced child labor, and child trafficking for labor exploitation. The ILO refers to child work as children at work in an economic activity (ILO 2002). It is a broad concept that encompasses most productive activities performed by children. It comprises light work and also those activities that do not harm the health and well-being of children (Scarpa 2008).

The ILO adopts the term “economic activity” as defined by the System of National Accounts (SNA). This term refers to the internationally agreed standard set of recommendations on how to compile measures of economic activity in accordance with strict accounting conventions based on economic principles. In the SNA, production is understood to be a physical process, carried out under the responsibility, control, and management of an institutional unit, in which labor and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The SNA includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services provided free to individual households or collectively to the community by government units or nonprofit institutions serving households (EC/IMF/OECD/UN/WB 2009).

According to the ILO document Child labour statistics. Report III. 18th International Conference of Labour Statisticians (ILO 2008b) – a document whose definitions are taken as a basis in the last Global Estimates of Child Labour (ILO 2017) – “the SNA production boundary is more restricted than the general production boundary, in that it excludes, among others, unpaid household services. Such production activities outside the SNA production boundary are defined as non-economic production, and comprise items such as cleaning, preparing meals and care of other household members.” On the contrary, production falling within the SNA production boundary is defined as economic production. As defined, the SNA production boundary includes nonmarket economic production but excludes non-economic production like unpaid household services, which are part of the definition of the general production boundary. The ILO has always maintained its decision to continue to measure child labor on the basis of the SNA production boundary, and not on the general production boundary. This decision was made primarily to maintain comparability with the earlier ILO Global estimates on child labor. It was also made because only a few countries provide the necessary data on unpaid household services carried out by children at home (ILO 2013).

This definition of economic activity and, therefore, of child work covers all market production and certain types of nonmarket production, including production of goods for personal use. As the ILO explains, whether paid or unpaid, the activity or occupation could be in the formal or informal sector and in urban or rural areas. Children working as maids or domestic workers in someone else’s household are
considered to be economically active. However, children engaged in domestic chores within their own households are not considered to be economically active, e.g., caring for household members, cleaning and minor household repairs, cooking and serving meals, washing and ironing clothes, and transporting family members (ILO 2002, 2017). It is undoubtedly complicated to label some types of activities. For example, the ILO document *Child labour statistics* (ILO 2008b) identifies common children’s activities such as the collection of water and wood for fuel, or repairing roofs or walls, as nonmarket economic production. It also gives some examples of household activities: cooking, washing up, indoor cleaning and upkeep of abode, care of textiles, installation, servicing and repair of personal and household goods, outdoor cleaning and upkeep of surroundings, minor home improvements, maintenance and repair, care of family members, and procurement of household goods and services. This classification raises two issues. Firstly, it is inherently difficult to discern between economic and noneconomic production in relation to work for personal utility in one’s household, i.e., why is collecting wood for fuel categorized as economic activity but cooking is not. Secondly, why are household activities categorized as economic production when performed in someone else’s house, but not when they are done in one’s own home. Addressing these issues is undoubtedly relevant since each successive definition is a subcategory of the previous one (e.g., ILO 2017). In other words, including the SNA production boundary would render it inherent to the concepts of child labor and all the worst forms of child labor. This could pose some controversial questions in the definitions of these concepts as will be seen in the next sections.

**Child Labor**

According to the International Programme on the Elimination of Child Labour, created in 1992 by the ILO, “the term child labour is often defined as work that deprives children of their childhood, their potential and their dignity, and that is harmful to physical and mental development. It refers to work that is mentally, physically, socially or morally dangerous and harmful to children and interferes with their schooling by depriving them of the opportunity to attend school, obliging them to leave school prematurely, or requiring them to attempt to combine school attendance with excessively long and heavy work” ([http://www.ilo.org/ipec/facts/lang%2D%2Den/index.htm](http://www.ilo.org/ipec/facts/lang%2D%2Den/index.htm)). In contrast to child work, child labor refers to hard tasks that should not be undertaken by minors (Scarpa 2008).

In other ILO documents, the term child labor has been defined as a term that excludes all children working legally in accordance with ILO Conventions on Minimum Age, 1973 (No. 138) and on Worst Forms of Child Labour, 1999 (No. 182) (ILO 2013, 2017). In practice, the elements which could turn child work into child labor include the *child’s age*, the *nature or conditions of the work*, or being engaged in *any of the identified “worst forms of labor”* (ILO and IOE 2015).

This has led to the establishment of a *minimum age* to begin employment, provided by the ILO and also stipulated in each national legislation. The ILO
Minimum Age Convention establishes that each Member State shall specify a minimum age for admission to employment or work, respecting the limits provided in this Convention. Article 2.3 establishes that this minimum age shall not be less than the age of completion of compulsory schooling and, in any case, shall not be less than 15 years. Nevertheless, some exceptions exist regarding the nature or conditions of the work.

Firstly, when employment or work is likely to jeopardize the health, safety, or morals of young persons, the minimum age shall not be less than 18 years or 16 years if national laws or the competent authority guarantee that these persons are fully protected or have received adequate specific instructions. This is the so-called hazardous work, defined by the ILO as “any activity or occupation which, by its nature or type has, or leads to, adverse effects on the child’s safety, health (physical or mental), and moral development. Hazards could also derive from excessive workload, physical conditions of work, and/or work intensity in terms of the duration or hours of work even where the activity or occupation is known to be non-hazardous or ‘safe’” (ILO 2002). Secondly, a Member State whose economy and educational facilities are insufficiently developed may initially specify a minimum age of 14 years. Thirdly, the Convention permits people from 13 to 15 years (or from 12 to 14 years in case of Member States with the aforementioned facilities insufficiently developed) to do light work, which is defined as work “(a) not likely to be harmful to their health or development; and (b) not such as to prejudice their attendance at school, their participation in vocational orientation or training programs approved by the competent authority or their capacity to benefit from the instruction received” (ILO 2017).

In any case, the establishment of a compulsory minimum employment age is difficult at an international level in light of the diversity of wealth and culture across nations (Bonet Pérez 2010). Currently, an absolute prohibition of working under a worldwide accepted age is difficult to establish because it can neither accommodate the social and economic particularities of each country (Nieuwenhuys 1996) nor result in a comprehensive solution to a global problematic situation. A different approach would account for the socioeconomic determinants of child labor, in which the regulation of a child’s labor rights could potentially be a temporary solution that guarantees both fair wages and workplace safety. With this in mind, the existence of fully organized child labor unions is remarkable, taking into account that they advocate for a child’s right to work and therefore for the legal recognition of fair conditions to carry it out (Cordero Arce 2015; Liebel 2015).

Pertaining to child labor, the ILO has selected the worst forms of child labor in its aforementioned Convention No. 182 (Worst Forms of Child Labour Convention) (ILO 2017). According to its article 3, “the worst forms of child labor comprise: (a) all forms of slavery or practices similar to slavery, such as the sale and trafficking of children, debt bondage and servitude and forced or compulsory labour, including forced or compulsory recruitment of children for use in armed conflict; (b) the use, procuring or offering of a child for prostitution, for the production of pornography or for pornographic performances; (c) the use, procuring or offering of a child for illicit activities, in particular for the production and trafficking of drugs as defined in the
relevant international treaties; and (d) work which, by its nature or the circumstances in which it is carried out, is likely to harm the health, safety or morals of children.”

Category (d) refers to the already defined hazardous work (Scarpa 2008), a more in-depth description of it can be found in the ILO Recommendation concerning the prohibition and immediate action for the elimination of the worst forms of child labor, 1999 (No. 190), which puts special emphasis on particular conditions such as exposure to physical, psychological, or sexual abuse, the use of dangerous machinery, or the existence of confined spaces and particularly difficult situations, e.g., very high or low temperatures, hazardous substances, noises, or long hours of work (Scarpa 2008). The three first categories (a, b, c) are the so-called unconditional worst forms of child labor; within these worst forms, the focus should be on where the ILO mentions “trafficking of children” and “forced or compulsory labor.” These concepts will be clarified in the next two sections; here it is interesting to point out that it has been argued that both forced child labor and child trafficking for labor exploitation are not actual “forms” of child labor (Cordero Arce 2015; Mendizábal 2011), because being subjected to an exploitative situation cannot be considered as a kind of work or labor.

As a last important data, it should be noted that, according to the ILO document Global Estimates of Child Labour (2017), most child labor takes place within the family unit. This means that most child laborers are not in an employment relationship with a third-party employer but rather work on family farms and in family enterprises. In this regard, it is important to highlight that children engaged in domestic chores within their own households are not considered to be economically active. Thus, the concept of child labor excludes domestic chores and subsequently narrows the scope of its definition as a specific subcategory of child work. This could be problematic because some studies have revealed that a great deal of child work takes place in the sphere of non-remunerated jobs within households. Children can be put to work within their own homes or within a relative’s home; indeed, the most common forms of work are domestic chores and, especially in poorer countries, agricultural tasks (Nieuwenhuys 1996). Then, the exclusion of the household realm from the concept of child work and child labor would overlook some situations where exploitation could also occur.

In fact, the ILO indicates that agricultural and household activities carried out by children have been neglected in global estimates and admit that child domestic labor is often masked by kinship arrangements (ILO 2006). This kind of labor has been experiencing social tolerance similar to what is deemed as acceptable within agricultural work, alleging that children are learning useful skills within this supposedly protective environment (ILO 2006). In the end, the ILO recognizes the convenience of advocating for the inclusion of child domestic labor as a form of child labor and potentially one of its worst forms (ILO 2006; Fabregat and Virrueta 2000). It is noteworthy that the distribution of children in child labor by employment status shows that child laborers work primarily without being paid by their own families: unpaid family workers account for more than two-thirds of child laborers (68%), followed by paid employment (23%) and self-employment (8%) (ILO 2013b). This shows that a large number of child laborers perform work within a domestic setting,
ranging from household chores to agricultural work. It is also significant to note that the exclusion of domestic work from the concept of child labor also has a gender dimension, since most of these tasks are undertaken by girls (see, e.g., Gibbons et al. 2005). If domestic chores within their own household are considered as noneconomic production, these activities would then be excluded from the concepts of child work and also child labor.

**Forced Child Labor**

When defining forced labor, the ILO refers to the general definition contained in the ILO Forced Labour Convention (No. 29, 1930), “all work or service which is exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily” (definition reaffirmed by the Protocol of 2014 to the Forced Labour Convention) (Allain 2013; ILO 2017b). The ILO also specifies that forced child labor can be distinguished from other forms of child labor through the presence of one or more of the following conditions: a restriction of the freedom to move, a degree of control over the child going beyond the normal exertion of lawful authority, physical or mental violence, and absence of informed consent (ILO 2002). In this sense, the definition of forced labor includes two of these criteria: the menace of penalty and the involuntariness (ILO 2005; Scarpa 2008).

The definition of forced labor contained in the ILO 1930 Convention is detailed in the aforementioned ILO document *Hard to see, harder to count: Survey guidelines to estimate forced labour of adults and children* (ILO 2012). The document outlines four dimensions of forced child labor, which are the same as for adults, but with some distinctive characteristics. The first three dimensions are equivalent to involuntariness, whereas the fourth dimension explicitly addresses coercion; this last dimension is further divided into six subcategories, in other words, six recognized methods of coercion which can be applied either directly to the child or to their parents (ILO 2012):

1. Forced and/or the deceptive recruitment of children. “Forced” means that, during the recruitment process, constraints are applied to oblige a child to work for a particular employer. “Deceptive” means that the child is recruited through false promises made to him/her or his/her parents.
2. Work and life of children under duress, which covers adverse working or living situations imposed on a child by the use of force, penalty, or threat of penalty. “Work under duress” may entail an excessive volume of work or tasks that are beyond what can reasonably be expected of a child given his/her physical and mental capacity. “Life under duress” relates to situations where restrictions on freedom or excessive dependency are imposed on a child by his/her employer.
3. The impossibility for children to leave their employer. The difficulty to leave an employer is characteristic of forced labor in situations where leaving would entail a penalty or punishment which, in the case of children, might be something seemingly less significant than for an adult; for example, an inference that his/her
parents would be extremely unhappy or disappointed if he/she were to leave and that the family would suffer as a result.

4. Regarding coercion of children, the categories of coercion of adults also apply: threats and violence, restriction of workers’ freedom of movement, debt bondage, withholding of wages, retention of passport, and abuse of vulnerability.

A specific question regarding forced child labor is that, given that a child cannot legally consent and is under paternal authority, to what extent do coerced parents play a role? In this sense, a child must be considered as a victim of forced labor when he/she is working with his/her parents, who are themselves victims of forced labor (ILO 2005). As the ILO document *Hard to see, harder to count* (2012), or the *Global estimates of modern slavery* (2017b) recognize, the penalty can be applied to the parents, rather than directly to the child. Indeed, two kinds of situations can ensue: one in which children are victims of forced labor because coercion is applied to the child or to the child’s parents, or one in which the state of forced child laborers results from her/his parents being themselves forced into labor (Dottridge and Jordan 2012).

According to the ILO (2012), forced labor of children cannot be characterized merely by the nature of the job or by the working conditions. Any type of economic activity undertaken by a child should be considered as forced child labor if some form of coercion is applied by a third party, either directly to the child or to his/her parents. It should also be noted that, according to the definition given by the ILO, the person imposing forced labor should be a person other than the child’s parents (ILO 2017b; Dottridge and Jordan 2012). The reference to the performance of an “economic activity,” and to the fact that coercion must stem from a third party, excludes some nonpaid domestic work as well as coercion applied by parents themselves, even though child labor most frequently occurs within the family unit (ILO 2017). Hence, this definition of forced child labor fails to recognize coercion directly applied by parents on the child.

Finally, it bears mentioning that the exclusion of domestic work can have a distorting effect on the definition of forced labor, a definition categorized as one of the unconditional worst forms of child labor. If child labor and its worst forms fall within the broader concept of child work, and if this term does not include domestic work in one’s household, does this really mean that child trafficking and forced labor cannot have the purpose of exploiting the child for domestic services within the family unit? In fact, these tasks are excluded neither from the general definition of human trafficking nor from forced labor, and, as the ILO itself recognizes, most child labor takes place within the family unit, with children working as contributing family laborers (ILO 2017).

**Child Trafficking for Labor Exploitation**

Like forced child labor, child trafficking is considered one of the unconditional worst forms of child labor. In this section, the difference between child trafficking for labor exploitation and child labor exploitation or forced child labor itself is highlighted.
Before explaining this distinction, it is important to reiterate the same criticism as with the definition of forced child labor: the definition of child trafficking, as an unconditional worst form of child labor, could exclude domestic work performed by children within their own household. This would certainly contradict the general definition of human trafficking for labor exploitation, focused, as it will be seen in this section, on the recruitment of persons for the purpose of being subjected to forced labor, which is defined as all kind of work or service exacted under the menace of any penalty. According to the definitions and considerations made by the ILO, both terms are not synonymous, with “forced (child) labor” entailing a wider and more comprehensive concept than “human (or child) trafficking for labor exploitation” (ILO 2008). Certainly, both terms have not been considered synonymous since the essentials of trafficking constitute a process, during which three stages can be distinguished: recruitment, transportation, and exploitation, as, for example, the UN indicates (UNODC 2006; Coster van Voorhout 2007; Olsen 2008; Scarpa 2008; Villacampa Estiarte 2011). In this last stage, one can find different forms of exploitation, with forced labor being one of them. However, since trafficking does not require the presence of an exploitative situation, but rather implies the purpose of exploitation, it should not be identified with the situation of exploitation that derives from the process of trafficking itself. As the word trafficking implies, it is a process that ends with the effective recruitment of the victim and the transportation to the place where he/she is going to be exploited (Bales/Trodd/Williamson cited Villacampa Estiarte 2011). Movement is an essential element of trafficking (Dottridge and Jordan 2012), regardless of the extent of this movement, whereas forced labor is a typical outcome of trafficking and occurs at the point of exploitation. Victims of forced labor may have migrated willingly and only been subjected to coercion after arriving; there can also be victims of forced labor in the same place where they live (Kane 2013).

Although human/child trafficking includes a stage of transportation, this does not necessarily mean crossing national borders, because victims can be recruited and exploited in one country (Jansson 2015). The UN *Global report on trafficking in persons* (2016 edition) highlights that most trafficking is national or regional, carried out by people whose nationality is the same as that of their victims, even though there are also notable cases of long-distance trafficking (also UNODC 2006). Even more, victims of trafficking can be also legal migrants, who may find themselves in the country of destination in a situation of vulnerability, which will facilitate the involvement of the person in a process of trafficking (Scarpa 2008). This *Global report* of 2016 affirms that this “domestic trafficking,” i.e., trafficking within the same country, has increased in recent years and accounts for some 42% of detected victims between 2012 and 2014 (see also Gallagher 2010; Plant 2011; Villacampa Estiarte 2011; Montero 2012; Burke 2013; Kane 2013).

According to the definition of the UN Protocol, human/child trafficking requires the presence of three elements, namely, act, means, and purpose. Put differently, this definition is fulfilled when the recruitment and transportation of the person are made by different means that are always tantamount to a lack of real consent, with the purpose of some form of exploitation (UNODC 2006; Smith and Kangaspunta...
Nevertheless, in the specific case of trafficking of children, the UN Protocol establishes that “the recruitment, transportation, transfer, harbouring or receipt of a child for the purpose of exploitation shall be considered ‘trafficking in persons’ even if this does not involve any of the means set forth in subparagraph (a) of this article,” that is to say, “the threat or use of force of other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person.” In other words, the consent of a child to be recruited for the purpose of exploitation is irrelevant. It is only necessary that the child is taken to be put in an exploitative situation, in this case to be submitted to forced labor, as defined in the previous paragraph.

The separate mention of trafficking and forced labor is not specific to child trafficking and forced child labor; it also applies to human trafficking and forced labor related to adults. Actually, this separate definition of trafficking itself and the purpose of exploitation have been questioned. Indeed, the punishment for those who engage in human trafficking intends to cover a process through which a person is recruited and transported with the purpose of some form of exploitation. Thus it is possible to differentiate between human/child trafficking for labor exploitation and forced (child) labor; the former encompasses the process through which a person is recruited and transported for the purpose of subjecting him/her to coerced labor or services, while the latter refers to the coerced work itself, in other words, to the situation of exploitation that consists of working against one’s will, under the control of another person. Taking this into account, it has been questioned whether the international emphasis on fighting human trafficking is the most comprehensive way to end human exploitation, which is in reality the genuine and final objective of this sort of initiative. While it is true that trafficking does not require the execution of the exploitative situation, it is necessary to ascertain all the stages of the trafficking process, namely, recruitment, transportation, and purpose of exploitation (see Sanghera 2005; Olsen 2008; Defensor del Pueblo 2012). Attempting to address all these factors makes it difficult to gather enough evidence to prosecute the crime and can lead to some collateral consequences. Some examples of such consequences include the low number of prosecutions in national tribunals for the crime of human trafficking, the strengthening of national border controls in order to better combat human trafficking, and more restrictive immigration policies. Another result of this interpretation of trafficking is that due to the lack of global evidence of this process, cases of trafficking have been prosecuted as different types of crimes (Defensor del Pueblo 2012, 274).

All these considerations raise the possibility of placing more or equal emphasis on the prosecution of the crimes that are tantamount to the exploitation itself, instead of focusing mainly on the fight against the trafficking process (Rodríguez Montañés 2015; Rijken 2013; Sánchez Tomás 2015). In fact, the current trend both in literature and in state practices is to accept that the concept of trafficking not only encompasses the process of recruiting the victim in order to exploit him/her but also includes the situation of exploitation itself (Gallagher 2010; Chuang 2014; Jansson 2015). Thus, asserting that the criminalization of human trafficking can serve as a means of
punishing those who engage in activities that lead to the situation of exploitation should be welcomed. However, the real target should not be forgotten. Since the genuine reason to prosecute this crime is to avoid future exploitation, emphasis should also be put on the prosecution of those who perpetuate the exploitative situation itself. A comprehensive fight against human trafficking for labor exploitation would give priority to the prosecution of forced labor itself without disregarding the aspect of trafficking.

This particular perspective could be primarily useful regarding child trafficking. When analyzing the implementation of the ILO Convention No. 182 (Worst Forms of Child Labour Convention), the Committee of Experts on the Application of Conventions and Recommendations – set up by the ILO to examine state government reports on ratified ILO Conventions – emphasized the necessity of eliminating trafficking in the fight against all the worst forms of child labor (Scarpa 2008). However, as it has been indicated, focusing on the process of trafficking could override the real objective, which is preventing exploitation. A comprehensive approach would be necessary to prevent not only moving children into a status of dependency, i.e., trafficking, but also the situations of exploitation themselves, e.g., forced labor (Sax 2018).

In conclusion, an indisputable correct step in this direction is the current trend to include the situation of exploitation as a core element of what constitutes human trafficking. In any case, two mentioned issues emerge here once again: the fact that child labor fails to encompass unpaid domestic work, a situation in which a notable number of cases of child trafficking and forced labor (subcategories of child labor) can be found; and the fact that, although the consent of a child is irrelevant in the field of trafficking, the given definitions of forced labor (the exploitative situation as the purpose of trafficking) start from the irrelevance of the child’s consent but refer themselves to the existence of coerced parents and the necessity that coercion be applied by a third party.

Abstract
A great deal of attention has been paid to trafficking across international borders; however, comparatively little attention has been given to those who are trafficked within the borders of their own country, including children. While growing attention has been given to this population, there is still confusion and misinformation about this crime. This chapter reviews relevant laws in several nations, as well as risk factors and forms of this crime. Lastly, effective interventions to assist these youth in leaving the life are discussed.

A great deal of attention has been paid to trafficking across international borders; however, comparatively little attention has been given to those who are trafficked within the borders of their own country. The International Labour Organization (2017) estimates that while those who are trafficked for sexual exploitation are the most likely to be trafficked across borders, a quarter are trafficked within their own country. This population, especially those who are children, has been receiving growing attention in recent years. In the United States, this crime is often termed domestic minor sex trafficking (DMST), while in the United Kingdom (UK), it is commonly known as internal child sex trafficking. It has been found to occur around the world in countries as varied as the United States, Canada, India, Burkina Faso, and Nigeria (Hounmenou 2016; Hounmenou and Her 2017; Mapp 2016; National Task Force on Sex Trafficking of Women and Girls in Canada 2014; Santhya et al. 2014). This chapter will explore permutations of legal definitions of this crime between nations and how what is trafficking in one nation is not in another. Demographic factors of children who are at heightened risk for being trafficked will be explained, as well as its four main types divided by who the exploiter is, and, lastly, methods of helping children leave the trafficking situation will be discussed.

Numerical statistics have varied widely in estimating the extent of this crime, and many have been subsequently debunked as too inaccurate to be of use. This is due in part to what is known as the “Woozle effect,” in which an estimate is initially offered together with the limitations of how that number was developed, but subsequent citations remove the discussion of limitations, and the estimate evolves to be considered fact (Salisbury and Dabney 2011). The Washington Post has published an article explaining why the most commonly cited statistic of those involved in DMST in the United States – 300,000 – was, in their terms, “bogus” (Kessler 2015). However, the US Institute of Medicine (2013) has stated that it is not a good use of resources to assess exactly how many children were being trafficked but rather that these resources should be put toward solving the problem.

A number of international documents address the trafficking of children and have established important differences between the trafficking of adults and children. In the United Nations Protocol to Prevent, Suppress and Punish Trafficking in Persons Especially Women and Children (commonly referred to as the Palermo Protocol), the “means” required for trafficking to have occurred – force, fraud, or coercion – is not required if the individual is under 18 years of age (United Nations 2000a). Articles 34 and 35 of the United Nations Convention on the Rights of the Child prohibit the traffic of children. In 2000, the Optional Protocol to the Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography was adopted by the United Nations in order to expand the protection for children against

---
these crimes. It similarly does not require means and states outright that “the use of a child in sexual activities for remuneration or any other form of consideration” is banned (United Nations 2000b, Article 2).

Attention to trafficking within national borders has been slowly evolving in national laws. For example, although the United States passed its first anti-trafficking law in 2000 – the Trafficking Victims Protection Act (TVPA) – it was not until the 2005 revision that domestic trafficking was specifically addressed (Title II – Combating Domestic Trafficking in Persons). It should also be noted that in the TVPA (Section 103(3)), similar to the Optional Protocol, the purpose of trafficking – exploitation – occurs if sexual acts, intercourse, pornography, or stripping, are exchanged for anything of “value.” This does not have to be money but can also include food, drugs, shelter, and so forth. In the United Kingdom, specifically England and Wales, a similar law – the Sexual Offences Act 2003 – came into force in 2004 in order to criminalize sex trafficking within their borders (Cockbain and Wortley 2015).

The difference between the commercial sexual exploitation of children (CSEC) and trafficking of children for sexual exploitation is difficult to untangle and can vary between nations based on their national laws, although both include sexual exploitation of a child as their purpose. Even within a nation, definitions can contradict each other. For example, in the United States, the Office of Juvenile Justice and Delinquency Prevention (OJJDP 2016, p. 1) defines commercial sexual exploitation of children (CSEC) as “crimes of a sexual nature committed against juvenile victims for financial or other economic reasons” and notes that this can include sex trafficking, as well as pornography and prostitution. However, the same government but a different agency – the Department of Health and Human Services – states that, “Human trafficking of a child for sexual exploitation includes all forms of commercial sexual activity with a child, including prostitution and participation in the production of pornography” (Child Welfare Information Gateway 2016, p. 3). Adding to the confusion is the fact that state-level laws vary as well; 25 states in the United States define stripping or exotic dancing by a minor as sex trafficking, but the other 25 do not (Child Welfare Information Gateway 2016).

It appears to be what is defined as the “act” of trafficking (recruitment, transportation, transfer, harboring, or receipt), specifically transportation, that creates the difference between CSEC and DMST in some nations. Some countries view transportation as necessary, while others do not. This may be due to the focus on the word “or”; some countries may be focusing on the fact that transportation is only one possibility of five acts, rather than stated as a requirement. This is strengthened by the fact that “receipt” is also one of the acts, and the United States has prosecuted buyers as traffickers on this basis (US Department of Justice 2013). For others, “trafficking” inherently implies some type of movement.

In countries such as the United States and Canada, transportation is not necessary for this crime to be considered trafficking (Administration for Children & Families n.d.; Department of Justice 2016); however in the United Kingdom and Australia, it is. In the United Kingdom, the Modern Slavery Act of 2015, Section 2 (1), states
“A person commits an offence if the person arranges or facilitates the travel of another person (“V”) with a view to V being exploited.” Similarly, the Australian Criminal Code Amendment (Trafficking in Persons Offences) Act 2005, Section 271.5, states that domestic trafficking occurs if “the first person organises or facilitates the transportation or proposed transportation of another person from one place in Australia to another place in Australia.” Therefore, if movement does not occur, it is considered commercial sexual exploitation (CSE), but not trafficking. In the United Kingdom, CSE is defined as:

Child sexual exploitation is a form of child sexual abuse. It occurs where an individual or group takes advantage of an imbalance of power to coerce, manipulate or deceive a child or young person under the age of 18 into sexual activity (a) in exchange for something the victim needs or wants, and/or (b) for the financial advantage or increased status of the perpetrator or facilitator. The victim may have been sexually exploited even if the sexual activity appears consensual. Child sexual exploitation does not always involve physical contact; it can also occur through the use of technology. (Department for Education 2017, p. 5)

In the United States, in contrast to the United Kingdom, the terms commercial sexual exploitation of children and domestic minor sex trafficking are relatively synonymous:

Sex trafficking is when a commercial sex act is induced by force, fraud or coercion OR when the person induced to perform the act is under 18 years old. A commercial sex act means any item of value is traded for any sexual service (prostitution, pornography, or sexual performance). Domestic minor sex trafficking is the commercial sexual exploitation of American children within U.S. borders for monetary or other compensation (shelter, food, drugs, etc.). This is synonymous with ... commercial sexual exploitation of children (CSEC). (Shared Hope International n.d.)

Now that the definition of the trafficking for sexual exploitation of citizen/resident children has been explained, as well as how it can vary between nations, it is necessary to explore what can place children at risk of this crime. Risk factors will be explained, as well as permutations of this crime divided by who is the exploiter. Due to the psychological coercion often seen with this crime, it can be difficult to help those who are trafficked to leave, and methods of doing so will be discussed.

**Children at Risk for Being Trafficked**

All children are at risk of being trafficked, regardless of individual circumstances, though some are at higher risk than others. The “means” of trafficking – force, fraud, or coercion – is not required for children due to recognition of their relatively immature ability for rational decision-making. Evolving science has brought an understanding that youth do not make decisions in the same fashion as adults, and their brain structure for decision-making is still developing until about age 25 (Konrad et al. 2013). This is particularly true for children who have experienced
trauma. The prefrontal cortex, which helps regulate control of behavior, planning, and risk assessment, matures later than other parts of the brain, making it more difficult to make logical decisions (Konrad et al. 2013). The ability to assess negative consequences or develop options in a situation is more difficult for adolescents (Beyer 2011). Sensation-seeking and acting in anticipation of an immediate reward are higher in adolescents, particularly in emotionally laden situations, when the more developed limbic and reward systems can override the relatively immature prefrontal cortex (Blakemore and Robbins 2012; Konrad et al. 2013; Romer 2010).

Children have been exploited, including for commercial gain, throughout history. However, changes in technology now facilitate this exploitation as children can be recruited and/or sold over the Internet and other platforms. These changes in technology are also changing social norms, which can lead to an increased risk of trafficking. Research has found the use of pornography to have become widespread among youth and that this affects perceptions of what is expected and normal in a sexual relationship, such as an expectation of multiple sexual partners and questionable consent (Marshall 2014). An English survey of 18-year-olds found that 46% of them agreed that “sending sexual or naked photos or videos is part of everyday life for teenagers nowadays.” Additionally, 81% agreed that “most young men look at pornography and 46% agreed that “most young women look at pornography” (as cited in Thomas and Speyer 2016, p. 21). Even outside of pornography, the sexualization of females in the media, including girls, contributes to the idea that females are only sexual objects (HTNCC 2014; Mapp 2016).

As noted, while all children are potentially at risk for being trafficked, certain demographics can place them at higher risk than others including their socioeconomic status, their ethnicity, their sexual orientation, or their gender identity, if they have experienced child maltreatment, if they have a disability, and if they are unhoused. These risk factors can occur on their own or can combine to further increase risk.

Poverty

Regardless of in which nation trafficking occurs, poverty is a common risk factor for being drawn into trafficking. For example, in India, the state of Bihar has been identified as a major area from which youth are trafficked. Bihar is less developed than other areas in India, and approximately one-third of its population lives below the poverty line (Santhya et al. 2014). Growing in an impoverished family can be a risk factor for a number of reasons. Children may long for the consumer goods their families cannot afford to buy them and see sex work as a method to earn money to buy them. They may be living in neighborhoods where there is prostitution or gang activity and come to see involvement in sex work or gang involvement as normal and acceptable. There can be biological impacts on the brain from living in poverty, which can result from a variety of sources, including the stress of poverty, a higher risk of lead exposure, malnourishment, as well as other reasons. These biological impacts can inhibit brain development that facilitates rational decision-making, as
well as potentially increasing impulsivity and risk-taking, which can lead to making decisions that involve one in trafficking. Poverty can also exacerbate other factors, exponentially increasing the risk of trafficking (Santhya et al. 2014).

**Ethnicity**

Those who are outside the majority identities of that country, such as by race, ethnicity, or caste, can be at higher risk for being trafficked. For example, while sex trafficking in Thailand has evolved from domestic trafficking to including more of those from surrounding nations, such as Laos and Myanmar, it began with those from rural areas of the country, including girls who were members of the hill tribes (Jayagupta 2009; US Department of State 2013). Girls would migrate to Bangkok searching for work and become involved in sex work. Many of them were not physically forced; however one study found that 90% were under the age of 18 when they began, thus meeting the criteria for being trafficked (Decker et al. 2011). In India, girls belonging to lower-caste groups have been found to be at greater risk for being trafficked (as cited in Santhya et al. 2014).

In Canada, Aboriginal girls are at particularly high risk of being trafficked (Kaye et al. 2014). Sethi’s pivotal piece (2007) cites a study that found that 60% of sexually exploited youth in Vancouver were Aboriginal. A 2017 news article stated that 50% of those trafficked for sex in Canada were of indigenous heritage, even though they only make up 4% of the Canadian population (Newton 2017). While the methods of recruitment and exploitation are not unique, Sethi notes particular vulnerabilities for trafficking experienced by this population including the legacy of colonization and residential schools. These institutions have weakened Aboriginal families and left children without role models for healthy families or life skills (National Task Force on Sex Trafficking of Women and Girls in Canada 2014; Sethi 2007). As noted above, poverty is also a major risk factor for trafficking, and Aboriginal children are much more likely to be living in poverty – 50% overall and 61% of those who live on reservations (Macdonald and Wilson 2016).

**Lesbian, Gay, Bisexual, Transgender, and Queer (LGBTQ) Youth**

Another group whose identity is marginalized within the broader society is youth who identify as members of the LGBTQ community, which can place them at risk for being trafficked. They are more likely to be harassed at school (Gay, Lesbian & Straight Education Network 2015) and may face abuse at home as well due to their identity. These potentially hostile environments can lead the child to seek emotional or physical refuge elsewhere. They may run away or seek supportive relationships on the Internet, which can lead to being trafficked. In the United States, 40% of homeless youth are members of the LGBTQ community and are on the street due to being kicked out of their homes for their identity or have fled their homes due to bullying at home or school as a result of their identity (Durso and Gates 2012). Even
if school and home are safe places for them, the heterosexist nature of society, with its relative paucity of positive same-sex relationship models or “safe spaces” to explore healthy same-sex relationships, can lead to risk factors (Nicholls et al. 2014). Issues relevant to LGBTQ youth are rarely included in sex education at school, leading them to seek information on the Internet, which can result in them connecting with people seeking to traffic them (Marshall 2014). It can also be difficult for them to locate potential romantic partners, again potentially leading them to search online (Smeaton 2013).

**Sex and Gender**

When we look at who is portrayed as a survivor of sex trafficking, every media picture is a girl. A commonly stated statistic is that 80% of human trafficking victims are women and girls (United Nations Office on Drugs and Crime [UNODC] 2009). Indeed, the vast majority of prosecuted cases involve girls, and they are by far the largest group found in research. However, it is important to note that we are looking for. Since much research draws from agencies who are serving survivors and most agencies only serve girls, logically this is the population that will be found (Holger-Ambrose et al. 2013). In contrast, community-based studies of those involved in trafficking have found that approximately half were young men: 54% and 47% (Dank 2011; Dank et al. 2015). In fact, the 2015 sample was only about one-third female (36%) and 16% were transgender. The most recent UNODC report (2016) notes an increased number of identified trafficked men and boys and postulates this may be because investigators are looking for them more. Nicholls et al. (2014) found that the professionals they interviewed believed that there was a positive correlation between having a worker specializing in services for boys and the number of boys served.

One study found that one-third of users of child sexual exploitation services were boys; these data were from Barnardo’s – the largest agency providing these services in the United Kingdom, utilizing data from their 28 sites (Cockbain et al. 2017). Boys differed significantly from girls in several aspects: they were more likely to be referred by criminal justice agencies than social service agencies; they were more likely to be referred due to having gone missing as opposed to concerns of exploitation, they were significantly younger at time of referral (14 years and 5 months as opposed to 14 years and 9 months), and they were significantly more likely to have a recorded disability (35% as compared to 13%) (Cockbain et al. 2017). This may be due to the perception among some staff that when a boy goes missing, it is more likely to be seen as an indicator that he is involved in criminal behavior rather than at risk for being trafficked (Nicholls et al. 2014; Thomas and Speyer 2016). Boys are more likely to be seen as agents in their actions, while girls are seen as tricked or deceived (Dennis 2008; Goździak 2016). Similarly, if the boy is perceived as having an older girlfriend, this was more likely to be seen as him “playing the field” than as a risk factor (Nicholls et al. 2014; Smeaton 2013). A unique recruitment factor that has been found for boys is through online
gaming, an activity in which boys participate much more than girls (Nicholls et al. 2014; Thomas and Speyer 2016).

**Disability**

There are significantly higher rates of disability among both boys and girls who have been trafficked – especially learning disabilities and autism – than in the general population (Cockbain et al. 2017; Smeaton 2013). Children with disabilities may be more sheltered from the outside world, more socially isolated, and possibly be overprotected and not allowed to make their own decisions, which can place them at higher risk for trafficking, as they have the same yearning for experiences that other children do, including to be “normal” and have friends, yet they have a lower awareness of the risks as they often do not receive any sex education nor information about trafficking (Franklin et al. 2015; Thomas and Speyer 2016). The traits of their disability can place them at higher risk. For example, children with autism tend to have a concrete definition of “friend” and believe that if someone is their friend, they are trustworthy, while a “trafficker” is a bad person and therefore would not be nice to them (Mapp 2016). Children with ADHD often have difficulties with impulsivity, as well as social skills, which can place them at higher risk (Beyer 2011). Children with intellectual disabilities have also been found to be trafficked at higher rates as they have the body of a youth, but do not have the corresponding ability to understand what is occurring (Reid 2018; Twill et al. 2010).

**Maltreatment**

Involvement in the child welfare system is a known risk factor for being trafficked, as is a history of maltreatment (Cockbain et al. 2017; National Task Force on Sex Trafficking of Women and Girls in Canada 2014). Children who have been sexually abused have been found to be at higher risk for being trafficked for sexual exploitation. Reid et al. (2017) found the risk was 2.5 times greater for girls and eight times greater for boys. Maltreated children may be at a higher risk as many have learned that people who say they love you will hurt you and are inconsistent in their love, much like traffickers. Some children who have been sexually abused have learned they need to trade sex for attention and how to keep secrets, both of which are mechanisms used by traffickers.

If children are then placed in the child welfare system, they are at risk for inconsistent caregiving and being seen as a means to a paycheck. If a trafficker pays attention to them and tells them that they love them, they often long for this positive attention. In both the United States and the United Kingdom, trafficked children have stated that being trafficked was better than being in care (Nicholls et al. 2014; Pettigrew 2013). In Canada, child welfare services may end in some provinces when the child turns 16, leaving them unable to survive on their own and thus vulnerable to being trafficked (National Task Force on Sex Trafficking of Women and Girls in Canada 2014).
Running Away

Regardless of country, running away can be both an indicator of and a risk factor for being trafficked. As discussed previously, the child may run away from abuse that is occurring at home or school – physical, sexual, or emotional – and then be at risk for being trafficked due to their inability to survive on the street on their own and meet their basic needs. Youth may also be running from a family life that is dysfunctional in other ways, such as parental substance abuse or intimate partner violence (Nicholls et al. 2014). The child may also run away in order to be with the person who is seeking to traffic them (Mapp 2016; Smeaton 2013). However, as stated previously, professionals’ views of this as a risk factor appear to be affected by the sex of the child. For females, it is often regarded as one, while for boys, this is less likely (Smeaton 2013) (Fig. 1).

Forms of Domestic Minor Sex Trafficking

In the United States, four basic types of DMST have been identified (Mapp 2016). Three of these are similar to those discussed by Sethi (2007) in her exploration of the trafficking of Aboriginal girls in Canada. This should not be taken to mean that there are no other forms or that youth do not move from one type to another. The form with which most people are familiar due to its dominance in the media is pimp-controlled trafficking. In this form, one person, most often a man, though it can be a woman, sells those under their control for profit. Youth in this form of trafficking are most
often girls, though it does occur to boys as well. The pronouns used below reflect these majorities, though it must be emphasized that the gender roles can reverse.

In this form, youth are often lured in through someone they know. In some cases, they believe the pimp is a romantic partner, who finds them on the Internet (such as Facebook, online gaming, or chat rooms) or in malls or other public places. A Canadian report noted that online recruitment was relatively rare there, with most children meeting their trafficker directly or through a mutual acquaintance, such as at a group home or at school (HTNCC 2014). Sethi (2007) noted hitchhiking and airports as recruiting locations for traffickers in Canada. The “boyfriend” will romance the girl and tells her that she is special; she truly believes they are in love. He will then manufacture a financial emergency and ask for her “help.” Once she is “turned out” (starts selling sex), he will then withdraw his affection and use it only as a reward. However, the romantic bond that he created between them means that she is less likely to seek help from others, including law enforcement (Mapp 2016). In India, this pattern has also been found where youth are approached in public places such as bus stops or markets and lured with promises of marriage or better living conditions. In some cases, parents were promised a dowry-free marriage. Kidnapping also occurs, though not as frequently (as cited in Santhya et al. 2014).

Gay, bisexual, or Transwoman/transman youth are vulnerable in the same manner to trafficking through a romantic relationship as other youth. However, due to the societal stigmatization of these identities, they can be at higher risk due to a possible perceived need to keep the relationship a secret. This can be heightened for non-White youth due to higher rates of stigmatization of non-heterosexual relationships that are often present in these communities (Nicholls et al. 2014). One research study found that heterosexual boys are often brought in through what they perceive as a heterosexual friendship in which the trafficker seeks to bond over stereotypical male activities such as football or online gaming. The trafficker will then seek to sexualize the relationship through the provision of pornography, which then leads to sexual touching (Nicholls et al. 2014).

In other cases, the youth has run away to a larger city but then are unable to survive on their own. There are not enough beds in youth shelters, and pimps and their recruiters will wait around to see who gets turned away. They will then offer a bed and something to eat. Once the youth has been lured in through friendship, the pimp may tell them they know a way to make some money or that it is time to start paying back what they have been given. The youth may have been introduced to drugs during this time and agree in order to get the drug (Mapp 2016).

**Gang-Controlled Trafficking**

The second form is gang-controlled trafficking and has been found to be perpetrated by local, national, and international gangs (Woolf 2013). As noted by British researchers (e.g., Beckett et al. 2013), there is a variety of types of sexual violence that can be experienced by those associated with a gang, of which commercial
sexual exploitation and/or trafficking is one. In this form of trafficking, the singular pimp is replaced by a gang. While male pimps may encourage girls under his control to refer to him as “daddy,” gangs are seeking to replace the entire family (Woolf 2013). Gangs can help to meet the youth’s desire for family and acceptance (Sethi 2007; Sikka 2009). Due to gender norms and heteronormativity within gangs, this form of trafficking occurs almost exclusively to girls. Girls often see themselves as part of the gang and doing what they can to help the gang earn money. They may be told that part of their earnings is being set aside for their college. In this form, girls are typically still living at home, and their parents may be completely unaware of their involvement in either a gang or trafficking. Girls may skip school or be trafficked after school or after their parents believe they are in bed (Woolf 2013).

In this form of trafficking, it can be even more likely that the child is seen as a perpetrator rather than as a victim. They may have committed crimes as part of the gang, furthering the likelihood they are seen as a crime perpetrator, rather than a crime victim (Shepherd and Lewis 2017). British researchers found that agency staff would refer to children “putting themselves at risk” through gang involvement rather than being at risk (Berelowitz et al. 2013, p. 8). As a result, children noted that they were not believed when they shared what had happened to them and survivors were not being recognized, in part because police might not be looking at gangs as traffickers. In Northern Ireland, individuals involved with paramilitary organizations have purportedly been involved with trafficking. The groups themselves were not involved in the activity, but these individuals used “the authority of their paramilitary links and the fear it engendered” (Marshall 2014, p. 12). Similarly in Canada it has been found that while many traffickers are gang-involved, trafficking is not an organized activity of the gang, but an individual activity. However, in exploring the trafficking of Aboriginal women and girls, gang-controlled trafficking has been found to occur (as cited in Sikka 2009). The girls seek out the gang in an attempt to seek acceptance and control over their life (Sikka 2009).

**Family-Controlled Trafficking**

The third form is family-controlled in which children are sold or traded by their families. If it is not for cash, then it is typically for drugs. Children in this form are often younger than those in the other forms of trafficking and have been found to be as young as 4 years old (Reid et al. 2014). In the United States, they have been found to be trafficked most often by their mothers, though male relatives, including cousins, uncles, and fathers, are common as well (Reid et al. 2014). However, in Canada, Sethi (2007) notes that for Aboriginal girls who are trafficked by family members, it is often a male family member, while Nixon and Tuttty (as cited in Sikka 2009) note the involvement of older siblings. Sikka’s (2009) research found that participants reported that girls were brought in by their older sisters when they themselves were considered too old to make their living by prostitution.
Survival Trafficking

The last form is survival trafficking in which there is no third-party facilitator, but youths trade themselves for items they need, which can be money but can also include food, shelter, or drugs. As noted previously, while in the United States, this is classified as trafficking, in the United Kingdom, this would be classified as commercial sexual exploitation, but not trafficking. This is the form where boys are most commonly found. They tend not to see themselves as trafficked, but rather as “hustlers” (Estes and Weiner 2001). Youth in this form are commonly brought in by a friend or a buyer (Dank 2011; Mapp 2016). Boys may engage in same-sex intercourse even if they themselves do not identify as gay in order to earn money (Dank 2011). This can inhibit their identification being trafficked, since they do not want to admit what they have been doing due to its stigma and professionals are less likely to see them as trafficked (as discussed previously and below).

Assisting Youth in Exiting the Life

Reaching out to survivors is difficult with any form of trafficking but can be even more difficult with children who are trafficked. Because of their immature cognitive development, children can be more likely to believe that the trafficker is looking out for their best interests and cares about them. They may not see themselves as being exploited, but rather helping out to earn money for “them” —the pimp, the gang, or the family. This is even further exacerbated in the form of survival trafficking when there is no third party and the child believes they are choosing this of their own free will. Because there is rarely visible physical coercion, but rather psychological coercion, trafficking can be difficult to recognize. Adults may see these children as crime perpetrators, rather than crime victims (Kendell and Funk 2012). On the other hand, when these youth are seen, they are often seen as passive victims, rather than active agents. This view can be seen in language that speaks of “rescuing” children from trafficking. Striking the right balance as recognizing them as victims of a crime yet active agents in their lives is difficult but necessary.

This can be even more difficult with male survivors due to society’s images of males as “tough” and as perpetrators and never victims. If boys are on the street, they are typically seen as possibly engaging in criminal behavior, rather than as potentially being a crime victim (Smeaton 2013). Even media to fight trafficking can make this more difficult due to the pervasive images of females as trafficked rather than both boys and girls (Nicholls et al. 2014). The stereotypical view in the media of a kidnapped girl who is physically forced to sell sex by a pimp contributes to other trafficked children not being identified, either by others or by themselves (Kaye et al. 2014; Smith 2015). Boys may not see themselves as victims of trafficking or may fear not being believed by professionals or that they will be perceived as gay (Nicholls et al. 2014; Thomas and Speyer 2016). Additionally, research in the United Kingdom has found that workers feel less confident in their ability to identify trafficking within cultural groups outside of White British and to work with these
communities. This can be due to lack of knowledge of cultural norms, intra-community solidarity, or language barriers (Smeaton 2013).

Therefore, it takes a certain style and cultural knowledge to be able to establish a connection to reach survivors of DMST. Barnardo’s, a child-serving agency in the United Kingdom, states that “assertive outreach” is required (Shepherd and Lewis 2017). They state that service providers need to reach out to children in their own surroundings and be flexible about when they are needed. It takes time to build trust, especially with these youth who have their trust violated time and again. Therefore, staff need to be friendly, approachable, consistent, and persistent (Shepherd and Lewis 2017).

**Services for Survivors**

Once survivors are seeking to exit the life, they will need support to allow them to do so and to recover from the trauma they have experienced. The National Task Force on Sex Trafficking of Women and Girls in Canada (2014) states that services must be available immediately when a survivor seeks them. These services must be comprehensive, easy to access, and ones that will not blame or judge the survivor. If survivors need to wait, or the services do not meet these criteria, their safety may be in danger, or they may not return (The National Task Force on Sex Trafficking of Women and Girls in Canada 2014). Services need to be culturally sensitive, including sensitive to the culture of trafficking. One agency director, Tina Frundt of Courtney’s House in Washington, D.C., herself a trafficking survivor, noted that judgment of the world in which the youth has been living can be a barrier:

> It’s like living on an island, right, so this is the United States. But imagine you came to my island. My island has a culture. It has laws. You may not agree with the laws or structure of my island at all, but you just came onto my island. My island has a culture that you don’t understand and know. My island has rules, and unspoken rules that you don’t understand or know. You look on the outside and judge my island and then you decide that it’s done wrong. And so now you rescue me from my island, and you took me away from my island and you popped me into services. You said this is the right way you’re supposed to do it, but then get mad at me that I miss my home. Because it wasn’t a good island, you’re absolutely correct. But it had rules and procedures that were imbedded in my culture. So you can’t just plop me out and say you rescued me. I may have hated it. But you don’t even understand my rules. So for you to help me, you gotta understand my rules too. And show me what is wrong with the island. Because I don’t know. I was growing up on the island; I thought everything was fine. (Mapp 2016, p. 83–84)

This underscores the importance of having those who have been trafficked involved in planning outreach and services. Survivors can understand what is needed and effective in a manner that an outside person never could. The National Task Force on Sex Trafficking of Women and Girls in Canada (2014) reiterates this point a number of times in their report. Lisa Goldblatt Grace, co-founder and director of My Life My Choice in Boston, Massachusetts, is not herself a survivor but co-founded and co-runs the agency with a survivor. She states:
We don’t make any big decisions, we don’t figure out what direction we’re going, nothing happens absent that [survivor] voice being key in how we run the program. We really center the program around the idea of trying to elevate that voice; that should be the loudest voice in the movement, both adult women who were there as kids and kids who are there now. (Mapp 2016, p. 76)

A broad variety of services are typically needed by all survivors in order to get back on their feet. Trafficking can have a broad range of negative impacts – physical, emotional, psychological, and social – and staff will often need to help survivors to access services to address these needs (Shepherd and Lewis 2017). Unique to working with children who have been trafficked is the vast number of agencies that are potentially involved, such as police, child welfare, schools, mental and physical health providers, the court system, as well as others (Mapp 2016). Additionally, youth will often lack the ID needed to access services. When working with DMST, the coordination of multiple agencies is a necessity, together with an effective case manager (Kaye et al. 2014; Mapp 2016; Shepherd and Lewis 2017; Smeaton 2013).

The Children’s Commissioner in the United Kingdom recommends the use of the “See Me, Hear Me” framework when working with survivors of trafficking, which includes a broad network linking relevant agencies and maintaining a focus on the child and their best interests at all times (Berelowitz et al. 2013). Based on principles from the Convention on the Rights of the Child, this framework’s number one priority is the best interests of the child and their right to protection. It then prioritizes the participation of the child. As the Children’s Commissioner notes, those who have been trafficked have been controlled by the desires of others, and all too often, children then are controlled by agencies purporting to help them, rather than partners in their own recovery. This model is explained in full in their report (Berelowitz et al. 2013). All services must be trauma-informed and represent an understanding of the deleterious and multifaceted impact that trauma has on survivors of trafficking and how it can affect their recovery (Mapp 2016; National Task Force on Sex Trafficking of Women and Girls in Canada 2014).

Conclusion

In conclusion, it is essential to recognize that children can be trafficked for sexual exploitation within their own nation, though the current numbers put forth are highly questionable. How this crime is defined in law varies from nation to nation, meaning that what is trafficking in one country is not in another, though risk factors that increase the risk of being trafficked do not vary greatly. There is a variety of roles that the exploiter may have in relation to the child, including pimp, gang, family member, or purchaser. In seeking to help youth leave the trafficking situation, it is essential to recognize the agency of the youth and include principles brought forth in the Convention on the Rights of the Child including best interests of the child and participation of the child in matters that affect them.
Regardless of what method it takes or what it is called, the selling of children for sexual pleasure within their own country exists around the world. While there has been an increase in awareness of this fact, stereotypes of who it affects and what it looks like inhibit accurate identification of survivors and provision of effective services. There must be education of both professionals and the general public of the actual face of this crime and interventions that truly meet the needs of those caught in this web. Methods to identify and assist survivors are often still anecdotal, and research is needed to more firmly establish what is needed and for whom, given the variety of youth in trafficking situations. If this is not done, those seeking to assist can do more harm than good. Youth affected by this crime must be seen as active agents and partners in their own recovery if services are to truly help them restore their lives.

Abstract

The complexities of human trafficking make this criminal activity one of the most difficult and dehumanizing movements to abolish. While the eradication of slave labor has the attention of government agencies and major manufacturers, it does not have a comprehensive approach to facilitate quick resolutions. This chapter aims to evaluate the trafficking of children in Western Africa and the connection to chocolate manufacturers and their suppliers through the farming of cocoa along the Ivory Coast. The exploitation of children in Western Africa, a population recognized as vulnerable due to their long-standing societal challenges including poverty and lack of education, has festered in recent decades. Even under the assurance of change to these practices by the leading chocolate manufacturers, this problem continues to grow with an estimated 2,000,000 children working on cocoa plantation throughout the region right now. Exploring initiatives to eradicate these practices is the focus of this chapter, at times placing the spotlight on Nestlé, the world’s largest processor of food. Considerations include an exploration of their...

prior, current, and speculative attempts to ratify the problem of child trafficking in their supply chain of cocoa production. From these assessments a theory of grassroots activity can provide insight into corrective measures. Changing the behaviors and attitudes of those that rely on the cocoa production, mainly the farmers, will create a lasting effect as globalization impacts the dominant values regarding the child labor that envelopes the region of the West Africa.

The Spoiled Supply Chain of Child Labor

The eradication of child slave labor is gaining the attention of government agencies and major manufacturers around the world; but, the problem of child labor continues to fester. While eight of the world’s leading chocolate manufacturers originally signed the Harkin-Engel Protocol, a voluntary agreement to eliminate child slave labor in the harvesting of cocoa by 2008, especially in Western Africa, progress is slow. Furthermore, these organizations failed to meet the self-imposed deadline; the National Confectioners Association along with the US Secretary of Labor, Hilda Solis, and the Labor Ministers of Ghana and the Ivory Coast came together to create a new statement. They signed the Declaration of Joint Action to Support Implementation of the Harkin-Engel Protocol which aims to reduce the worst forms of child labor by 70% across the cocoa sectors of Ghana and Cote d’Ivoire by 2020.

As time closes in on the presented deadline, studies show that while improvements have been made, the problem of child labor continues to fester. Many of the world’s leading chocolate manufacturers have implemented social programs but tend to place their primary focus on technical projects such as sustained farming. These programs often attempt to address the need for a reduction in child labor, but they do not directly address the eradication of child labor. According to the 2018 Cocoa Barometer (2018), a report published by researchers from 15 nongovernment organizations (NGOs) in Europe, there remains an estimated 2.1 million children farming cocoa in just the regions of Cote d’Ivoire and Ghana. The numbers demonstrate that while initiatives are being employed, there is no single organization or government agency making a significant impact on the abolition of slave labor in cocoa production. With this in mind, some companies are attempting to be more transparent in their efforts by incorporating Child Labor Monitoring and Remediation Systems (CLMRS) into their supply chains. This chapter will examine a case study of the world’s largest processor of food, Nestlé (Lawrence 2016), and their prior, current, and speculative attempts to rectify the problem of child trafficking in their supply chain of cocoa production.

Children: A Vulnerable Population for Slave Labor in Western Africa

Areas of West Africa including Cote d’Ivoire, Ghana, Togo, Benin, Nigeria, and Cameroon are destinations for children being trafficked for slave labor and domestic
servitude, according to the US Trafficking in Persons (TIP) Report (2018). The report defines the slave labor as “the use of force, physical threats, psychological coercion, abuse of the legal process, deception or other coercive means to compel someone to work” (p. 32). In the Cote d’Ivoire, children are subject to forced labor the agricultural and service industries. While there is no defined sex discrimination, boys are often sent to farm and fish, and girls are sent to work in restaurants, massage parlors, and domestic services.

Children are easy to manipulate with emotional and physical threats making this type of trafficking difficult to detect. Children do not have the resources to report their abusers and typically find themselves restricted from outside physical contact either by force or threat. Children working in the cocoa plantations along the Ivory Coast are trafficked in various ways; but, the two most common actually originate from their families. While it is not uncommon in most cultures for children to work alongside their parents in a family business, it is not acceptable for children to work if it affects their mental or physical health or takes away the opportunity to go to school and obtain an education. This is in accordance with the International Labour Organization’s C182 – Worst Forms of Child Labour Convention (1999). Nevertheless, most citizens in Western Africa are ill-educated and unaware of these restrictions to, and definitions of, acceptable practices. Families in this region of the world often inherit poor farms; and therefore, it is customary to require their children to stay home and work alongside the rest of the family for survival. Although most people do not realize it, this is still a form of trafficking.

These cocoa plantations are not the sprawling fields we envision in the southern hemisphere of the United States. They are small parcels located in the jungle that are difficult to manage and often provide the owner with little income, making it difficult to pay salaries for the harvesting of the cocoa when demand for the product from major corporations, including Nestlé, continues to grow. Nevertheless, forcing young family members to work on the plantation, while denying them an education, is in direct violation of several previously mentioned protocols and declarations, even if it is considered a last resource of survival for the immediate family.

A second common form of trafficking occurs when parents send their children off to these farms with the hope of finding good pay and an education for the child. In many countries, it is not uncommon for young children to leave their homes in Western Africa and migrate to the Ivory Coast with the expectation of being provided work (O’Keefe 2016). The preponderance of trafficked minors do remain in the countries of West Africa; however, according to the last US TIP Report (2018), a rising number of children are being exported to North Africa and Europe to serve as domestic servants or work within the sex trafficking industry.

Why would these families allow their children to be enslaved? They are often deceived with notions of false opportunities. Traffickers in this region will portray themselves as school teachers promoting education for children ranging from 5 to 15 years of age, when in reality they are slaveholders looking to exploit families and force the young students to panhandle in place of the time they should be spending in the classroom. Some children are sent directly into the agricultural sector to work the plantations; this is according to the US TIP Report (2016). These
Traffickers keenly prey upon poorly educated parents and often lure their children away with the promise of education, apprenticeship training, and a better life. Parents send their child off to unknown countries with a hope and dream for a better future, rarely ever seeing or hearing from the child again. It is not only a customary practice in many countries; but, it is also a cultural expectation for parents to accept opportunities for their children when those opportunities are presented. Rejecting such an opportunity would demonstrate that the parent did not care for the child or the family unit. Traffickers are mindful of this custom. Other traffickers simply abduct children knowing that law enforcement is not equipped to track the children or prosecute the trafficker. Children are often left scared, confused, and incapable of asking for help.

The lack of government support compounds the vulnerability of children in most West African countries. While many of these governments attempt to combat the forced labor of children, especially in the agricultural, mining, and fishing industries, gaps and lack of law enforcement by the governing agencies ultimately leave children unprotected. According to the US TIP Report (2018), the governments of these countries maintained inadequate records of their prosecution, protection, and prevention efforts and therefore are classified as Tier 2 or Tier 2 Watchlist. These classifications demonstrate that while the country does not meet the minimum standards to be compliant with the Trafficking Victims Protection Act (TVPA), they are making efforts to prevent and protect victims of human trafficking. However these efforts often fall quite short of the overall goal. The corruption of smaller local governments makes it difficult for state authorities to account properly for the victims. Compounding this issue is the absence of support received by nongovernment or social organizations and missionary groups working in the region, from law enforcement, to adequately address the problem. The regulations created to protect children cannot work if they are not enforced. Children are left vulnerable when the adults in place to protect them have insufficient resources available.

Life on the Cocoa Plantation

The word plantation often conjures visions similar to the southern plantations of the United States, with large homes and lifestyles of leisure that were afforded through the labor of the transatlantic slave movement. When in reality the word just refers to a farm that is cultivated by resident labor which includes cocoa plantations which are typically small, poor, and oppressed by governments and law enforcement. Maintaining plantation crops can be difficult when the longevity of the harvested plant is only 10 years; and, without the resources to invest in replanting, along with the uncertainty of income, farmers are driven to make short-term decisions (Guest 2015). This means that they rely on the low-cost labor of children to survive. According to the US Department of Labor (2012), most children working on the cocoa plantations are between the ages of 12 and 16, with some children working as young as 5 years of age.
Children working in the agricultural industry are often forced to work long hours, 7 days away, and frequently exposed to severe weather conditions. Traffickers impose physical and emotional abuse upon the children as a method of instilling fear and increasing productivity. Economic conditions are hard, and children are often forced to survive on cornmeal, bananas, and limited freshwater. They also take their nightly rest in poorly ventilated buildings while sleeping on wooden planks (Harkin and Engel 2005). These conditions lead to illness and poor recovery from injuries sustain in the hazardous work environment.

A typical workday for the laborers starts at dawn and ends at dusk. Children spend the day utilizing dangerous equipment. Some will use chainsaws, while others will cut down the large bean pods with machetes and large knives (Mull and Kirkhorn 2005). Pods are harvested in rotation every 2 weeks throughout the 8-month season. The bags of cocoa pods weigh over a hundred pounds; and, the children are expected to drag them through the forest. In the BBC production of Chocolate: The Bitter Truth (Kenyon 2010), a former cocoa slave, Aly Diabate, gave a recount that often “bags were taller than me. It took two people to put the bag on my head. And if you didn’t hurry, you were beaten.” She also spoke about being locked in at night and watching other slaves being beaten for trying to escape. According to her, this was a part of her daily life.

In addition to physical and emotional abuse inflicted by their traffickers, many children are injured or scarred from the hard labor and use of dangerous equipment, according to the US Department of Labor (2012). Hazards include the application of pesticides without any protection, handling dangerous equipment, and working long exhaustive hours. Harvesting of the cocoa requires splitting open the hard shells of the pods with large machetes and wooden rods. This allows the worker to remove the cocoa beans and sweet pulp inside so that it may be dried and fermented before being bagged and sold. Many of the tools used in the farming of cocoa are in violation of the International Labour Organization (1999) C182 – Worst Forms of Child Labour – and yet the violations go overlooked and unnoticed by law enforcement. In a documentary, The Dark Side of Chocolate (Faber 2010), a young boy is seen asking the camera crew why they want to eat his flesh. In his mind, that is the cost of harvesting the cocoa. He has witnessed the many injuries and the blood shed through the harvesting of the bean pods. These children have a difficult time understanding the demand for chocolate, a product many of them have never even tasted.

Supply and Demand

Cocoa is crucial to the economy of Western Africa. The lush jungles of Côte d’Ivoire make this country the world’s leading producer of cocoa, generating just under 2 million metric tons a year (Bitty 2015). That’s 40% of the world’s cocoa supply with the majority produced by over three million small plantations (Guest 2015). Some estimates are higher, claiming as much as 70% of the world’s cocoa is produced in West Africa. However this cocoa is not from one large source but rather small family parcels. These smallholders of cocoa are at the start of the supply chain. Having such
a crucial role in a product of high demand would seem to place the farmer in a position of power. However, that is not the case. A lack of education and cultural norms have conditioned the farmers to accept that they have no bargaining power and must accept whatever monetary compensation they receive through the harvesting of the cocoa. Life on the plantation is hard for both the farmer and the slaves when trying to meet the increasing need for cocoa (Percival 2014). A typical cocoa farmer has an income equivalent to the poverty line, which amounts to approximately $1000 USD annually, with a few meeting the criteria of lower-middle class with annual incomes just under $3000 USD. It is easy to access that these amounts does not allow the farmer to pay salaries or offer any suitable accommodations to workers, creating financial pressures that result in the plantation owners resorting to the slave labor of children in order to survive. The impoverished conditions do not improve when the country’s economy is dependent upon the demand for chocolate. The government may overlook the farmer’s plight in an effort to meet the demands of traders, processors, exporters, and manufacturers seeking higher profit margins. The leading chocolate manufacturers include ADM, Mars, Hershey, Guittard, Blommer, and of course Nestlé, all of which continue to have slave labor in the supply chain of cocoa.

However, there are some recent studies that demonstrate Nestlé is making attempts to talk about shared values and increasing payments to smallholders, as well as conditions and education for children; but it has struggled to develop an effective model (Guest 2015). The challenge is for companies to establish which small farms the cocoa is actually coming from and under what conditions it is being farmed, according to an article in Candy Industry (2012). Typically farmers stack their bags of beans at the end of the property and paid as the truck comes through. Since there are so many small plantations, the truck picks up all the bags along a route, stacking them together. This makes it difficult to determine what beans are harvested at each farm and which farm employs slave labor, tainting the supply chain.

The ability to clean up the supply chain may be more of a grassroots endeavor. The International Labour Organization has recognized that solutions lie within social progress, especially in the assuagement of poverty and greater opportunities for universal education. Auret van Heerden, the president of the Fair Labor Association (FLA) in 2012, agreed to work on a project with Nestlé to investigate their supply chain. He was quoted in an interview with Candy Industry as saying, “working with the FLA will help Nestlé and other stakeholders in West Africa to protect children in the cocoa supply chain. Eliminating child labor will take an enormous commitment from Nestlé and other companies sourcing from the region.”

**Nestlé’s Creating Shared Values**

Creating Shared Values (CSV) is a document produced annually by the Nestlé Corporation to outline the mission it envisions, the goals it aspires to, and the strategies being executed to reach those goals. The stated objective for Nestlé is to
remain the leader in nutrition and wellness while also becoming an industry example for economic leadership. Noted on the company’s website is the responsible sourcing page where a claim is made that Nestlé is “committed to fostering responsible practices in our supply chain, while ensuring that our sourcing and supplier relationships deliver a competitive advantage” (2016).

Nestlé claims to have a vision of value that includes providing a respect for people and the environment (Nestlé 2016). The company provides a basic supplier code of ethics, distributed in 26 languages, where a minimum standard is postulated for suppliers and subcontractors. While Nestlé claims the right to inspect both internal and external cooperative organizations from within their supply chain, it does not specify standards or penalties for infractions. These infractions of forced child labor have plagued Nestlé for years. This is a critical issue predominately in areas of the Ivory Coast of Africa, and yet the organization does not define these principles. In general, chocolate manufacturers are struggling to control cooperative organizations and transparency in their supply chains with the use of CLMRS, when increased profit margins are the driving force for the economy in the region. This supports the deduction in the case study used for this analysis that a grassroots approach may be the best method of modifying cultural values of both the plantation owners and the chocolate industry. A design that would incorporate both education and cultural sensitivity to the long-standing societal challenges of the region would be essential for a successful grassroots initiative (Lawrence 2016).

Creating Shared Values and Child Labor Speculations

An objective outlined in Nestlé (2015) philosophy is a significant impact in the abolishment of child slave labor by 2020. The company provides a framework which includes training 60,000 farmers to effectively manage their plantations along with the establishment of 60 schools. The framework also incorporates a labor monitoring and remediation system for their cooperatives. While the overall plan appears comprehensive, the company appeared to be falling short of meeting those objectives. So in 2017, Nestlé created their Tackling Child Labour report Nestlé (2017). The report looks at the company’s transparency, current situation with regard to child labor, and future initiatives. The report now speculates noticeable improvements by 2030 which is an expanse of time from their initial indication of 2008, followed by 2020. Nonetheless, Nestlé now recognizes the need for collaboration not only with human rights organizations but their competitors to bring about real change. As stated in the report, a company cannot succeed if they are working in isolation, and this may be an indication that real changes in child slave labor may actually occur.

Regardless, speculations of child labor do continue to plague Nestlé. In 2016, the US Supreme Court rejected a proposal by Nestlé to discredit a lawsuit holding them liable for being aware of and supporting cooperative organizations that continue to ignore forced child labor in the harvesting of cocoa off the Ivory Coast (Ziegler 2016). The lawsuit not only contains allegations that Nestlé was aware of the problem with child trafficking but that the company offered technical assistance to
farmers utilizing slave labor in an effort to regulate the low cost of cocoa. The increase in legal obligations and decrease in stakeholder trust may have influenced Nestlé’s decision to investigate further into the problem of child labor and produce their first Tackling Child Labour report.

These problems appear to represent a gap between the objectives stated in Nestlé’s CSV and the allegations of supporting child labor. In 2016, an article in Fortune claimed that while efforts were being made by the large chocolate manufacturers, the reality remained that 2.1 million children from Western Africa are still engaged in the physically demanding and dangerous work of harvesting cocoa (O’Keefe). In addition, a report from Euromonitor International (2016) demonstrated that in 2015, Nestlé had purchased less than 30% of the cocoa from supplies that were considered certified to be slave labor-free. While these reports were produced the year prior to Nestlé’s new position that they will work in collaboration with human rights organizations as well as competitors, current reports including the 2018 Cocoa Barometer (2018) demonstrated that while initiatives are being tested, there is no single organization making a significant impact on the practice of child slave labor in the harvesting of cocoa.

Outlying factors widen the gap between Nestlé’s objectives and the realities of cocoa production. The US Department of Labor’s 2014 report on the worst forms of child labor demonstrated that the operating budget for the anti-trafficking unit in Cote d’Ivoire was only $7700, an insufficient amount to adequately manage and control the use of child labor in these areas (O’Keefe 2016). Nestlé’s Tackling Child Labour report offers many statistics regarding actions in the modification of child labor, claiming to provide a more effective and transparent response, but actually fails to provide any clarity regarding their investment or funding into these programs. There is mention of cost implications and that to offset these expenses the current workforce would be given the added responsibilities of monitoring the CLMRS. However, this extra workload raises speculation as to the efficiency of monitoring such a complex and diverse initiative.

Understanding how complex the issue of child labor is in Western Africa, the 2014 report by the US Department of Labor also disclosed an interview with a law enforcement official in Cote d’Ivoire that revealed the cultural paradigm for officials in the area. There is a big boss, often referred to as the chief of the village. Charges would never be brought against the chief because there is a social order to maintain and arresting a man of that magnitude would create upheaval within their cultural norms. Fear of consequences and a general lack of understanding by law enforcement regarding policies and initiatives compound the issue. So while there is reason to hope that a collaborative effort focusing on grassroots education in these small communities can have a significant impact, there is also reason to speculate, based on the history of the cocoa manufacturers, that the implementation of child slave labor will continue to grow as long as the demand for cocoa continues to grow.
Solutions for the Cocoa Industry

The exploitation of child labor in the production of cocoa is multifaceted. While the problem exists among the predominance of cocoa manufacturers, this chapter focused on a case study of Nestlé. This was intentional with the consideration that Nestlé is the world’s largest food and beverage provider and therefore should have a conservable extent of accountability to their supply chain. With this consideration in mind, the key to having positive outcomes with any organization is to recognize the impact on both the company’s stakeholders and the communities in which their supply chain originates. The previously mentioned case study of Nestlé (Lawrence 2016) demonstrated that the most operative recommendation for monitoring these objectives occurs at the grassroots level. The recommendation is developed from the extensive sociohistorical backgrounds of cultures in the region of the Ivory Coast. Instead of a top-down approach, a grassroots attitude would be best suited for tackling child labor on the cocoa farms (Berlan 2013). This bottom-up approach considers the behaviors and beliefs embedded in the region and offers a level of self-efficacy (Bandura 1977; Tompkins 2013) for members of the community to be in control of change at the local, national, and international level. This change would be significant since most famers do not feel they have any control over their means of support of assets and live under the dictatorship of the buyers and village law enforcement. These initiatives can review successful programs with similar objectives. A grassroots study conducted in the Caribbean demonstrated how community media played a role in promoting agricultural practices and assisting the empowerment of women and looks at the modernity that promoted the approach (Prendergast 2012). This is an example of a grassroots approach to cultural change that could be considered for implementation in Western Africa.

This grassroots approach would utilize and employ individuals in the area to monitor, educate, and contribute to finding new methods to assist farmers during the harvesting of the cocoa pods so that children can remain in schools. These efforts should be employed in the surrounding countries of the sub-Saharan region since most children migrate to the area through the encouragement of their family to seek education, employment, and a better life, noting that those families often do not realize the dangers and harsh conditions of enslaved labor to which the children may fall victim. While this seems to be a practical approach, the organizations in the area should be mindful that practical knowledge and a general appreciation for the underlying causes need to form a greater part of debates regarding the eradication of child labor (Berlan 2013). Typical grassroots tactics can be employed and funded through the resources allocated by the large chocolate manufacturers, but there needs to be a greater transparency regarding the funds being allocated. Reeducating farmers on how to harvest, manage labor, and increase profits in conjunction with a cultural outreach of awareness directed toward the advantages of educating children can provide long-term changes to the region. A study regarding injustices and grassroots efforts to enhance education in sub-Saharan regions demonstrates that
organizations interested in promoting social justice should concentrate on improving access to and quality of low-cost private schools (Tooley 2013). Grassroots initiatives are useful in finding the incentives and intentions that motivate participation and acceptance (GrassRoots 2016). While the grassroots campaign pushes for new resources, attitudes, and an overall shift in values to reduce exploitation of children by the farmers, a lower tolerance needs to be implemented by authorities with harsher consequences to organizations that profit from these abusive behaviors. While a bottom-top approach will be successful in changing accepted norms of slave labor practices, a secondary top-bottom approach may enhance these efforts. By offering a perspective of required compliance or consequences, executives may be motivated to foster responsible efforts and assure that supply chains are being freed of child labor. This top to bottom approach addresses accountability. So often the large organizations claimed ignorance as they purchased from a supplier that had fair labor practices; however, they neglect to monitor where that supplier received their raw resources. This is where we encounter the child labor. Therefore, boycotting a single unit in the global chain will prove ineffective, according to Parella (2014). This study also considers public actors as a source to supply incentives, as well as working with stakeholders to facilitate an embargo against the entire global supply chain. These measures are far more effective, and if the executive administrators are personally held accountable for a tainted supply chain, embargos, and loss of revenue, a lot more resources will be provided to grassroots organizations, there will be a transparency to the funding, and change in cultural perspectives can begin to occur.

**Conclusion**

While there is no easy solution to eradication of child labor, it should be a clear focus of every manufacturer, legislator, and consumer of cocoa that this issue needs to be addressed more expeditiously. The exploitation of child slave labor still exists in Western Africa with an estimated 2,000,000 children working on the cocoa farms right now; for most people that 2,000,000 is too many. But the problem is overwhelming leaving more questions than answers. Today, Nestlé, along with dozens of world’s largest producers of cocoa, still remains a major sponsor, whether directly or indirectly, in this violation of human rights activity. While changes are not anticipated either practically or fundamentally to occur immediately, better efforts can be made in analyzing, employing, supporting, and monitoring the actions taking place to eliminate child slave labor, as agreed upon in the first Harkin-Engle protocol of 2001 and again in 2010 with the Joint Declaration for action by the International Labour Organization (ILO). It appears now that these organizations may be organizing a new declaration for 2030. The children addressed in the first protocol will be grandparents by the time child slave labor is projected to be eradicated.

The plans being implemented are working on the surface but are not correcting the deep-rooted issues in the cultural values and expectations.
When it comes to human rights violations, patience is never a virtue, but it just may have to be in this case. Changes will require time for new trends to emerge and norms to change, from the bottom-top perspective of community acceptance and understanding of children’s rights and needs to the education of the farmer and the empowerment of fair-trade practices. This would offer alternatives that would help provide better outcomes than the controlled slave labor of children. Looking further down the road, there is the top-bottom initiative regarding the accountability of executives and responsibility of law enforcement and finally resting on the resolve of the consumer to only purchase fair-trade (slave-free) products. This lineage requires patience but it also requires diligence.

These acts of injustice will not deter chocolate from being a beloved treat throughout the world. To provide us with the indulgence of this sweet confection, millions of children will continue to be recruited and enslaved in labor of farming cocoa. This reality is bitter-sweet. Nonetheless, consumers are powerful in their influence to major corporations and the latter of aforementioned initiatives. If we look to persevere in the fight against child slave labor, then pressuring the cocoa manufacturers to work more expeditiously and diligently in their efforts might produce the sweetest results of all, a slave-free world.

Abstract

Human trafficking is perceived to be a “moral evil” obligating every state to prevent and protect the current and future victims. Such an obligation attains higher priority when victims are children. There is a global consensus that child trafficking is one of the most inhumane forms of trafficking where children are traded as commodities to be exploited for labor and sex. This chapter discusses the current state of child trafficking. It focuses on children who are trafficked and forced to perform jobs well beyond their physical capacities jeopardizing their well-being. The chapter reviews general forms of child trafficking globally, and

then it moves into the discussion of child trafficking for labor in Southeast Asia – India. It discusses some of the underlying factors such as culture, economics, and social structure that perpetuate such practices despite local and international prevention and control efforts. The chapter closes with a discussion of some of the strategies and suggestions for the protection of children’s rights and prevention of child labor trafficking.

Introduction

Child trafficking is perceived to be one of the most inhumane forms of child exploitation where children are “sold and bought as commodities.” The extant literature indicates that child trafficking like other forms of trafficking is prevalent in almost all parts of the globe. Children are easy to obtain, especially in states where there is abject poverty and the mainstream culture marginalizes poor families and children. They are used as cheap or unpaid form of labor, forced into prostitution and marriage, illegally adopted, and used for sport and organ harvesting. Some literature reveals that children are also recruited to serve into armed groups (Allred 2005). More recent research (Honwana 2011) reported that an unprecedented number of children are coerced into fighting as soldiers and others are thrust into it by poverty and crises in their communities. Children as young as eight are recruited as soldiers and transformed into merciless killers, committing the most horrendous atrocities.

Nature and Extent of Child Labor Trafficking Globally

The latest global estimates reported by the International Labor Organization (ILO, 2017a) reveal that globally there are 152 million children engaged in child labor – “almost half of them in its worst forms.” These 152 million child laborers consist of 64 million girls and 88 million boys. This translates into approximately 10% of all children engaged in labor. Seventy-one percent of these children work in agriculture sector, and 69% perform unpaid work within their own family unit. The report indicates that approximately half of all the child laborers – “73 million children in absolute terms – are in hazardous work that directly endangers their health, safety, and moral development” (ILO 2017a, p.11).

The most recent ILO’s Red Card to Child Labor Campaign (2018b) reported that more than half of the children in the global labor force are performing jobs that jeopardize their health and safety. An earlier report issued by the ILO (2015) stated that, approximately, “Twenty-one million people – three out of every 1,000 people
worldwide – are victims of forced labor across the world, trapped in jobs which they were coerced or deceived into and which they cannot leave.” The largest number of forced laborers in the world – 11.7 million (56%) – resides in the Asia-Pacific region. According to the same report, 90% (18.7 million) are exploited in the private economy, by individuals or enterprises. Of these 4.7 million (22%) are victims of forced sexual exploitation; 14.2 million (68%) are victims of forced labor exploitation in various industries, such as agriculture, construction, domestic work, or manufacturing; and 2.2 million (10%) are in state-imposed forms of forced labor, such as in prisons or in work imposed by the state military or by rebel armed forces. More than a quarter (26%) of these victims – approximately 5.5 million – are below 18 years of age. In many cases these children become trafficking victims and end up as unpaid laborers or sex slaves in their native or foreign countries.

Children Trafficked for Sexual Exploitation

In addition to labor, empirical evidence suggests that often children, especially female children, are trafficked for sexual exploitation and India has emerged as one of the main suppliers of children for sexual exploitation (International Justice Mission 2017). Younger female children are sold into brothels and trafficked to neighboring states and countries for sex work and prostitution. India Today (2013) reported that, “In India nearly 1.2 million sex workers are below the age of 18 with about 40 underage girls being forced into prostitution on a daily basis. With the 8% increase in the flesh trade, India has become one of the prominent names in child prostitution.” A more recent newspaper report (Reuters, 2018) stated that according to several nongovernmental organizations, 16 million of the estimated 20 million girls and women working in India’s sex industry are victims of trafficking. The same report also described that as part of the grooming process, it is quite common to inject young girls (as young as 5 years old) with growth hormones to make them physically grow and look like women and inject them with sedatives and drugs while they are being trafficked from one place to another. A 2017 report by the West Bengal government highlighted the brutal “breaking in” of girls trafficked into brothels, a process that often includes rapes, beatings, and starvation (Reuters, 2018). Another reporter of IndyStar (2018) adequately describes the dangers children face in India. The report stated, “Life is brutal in these dark halls and squalid rooms. Violence is a constant threat. Alcoholism is rampant. Strangers wander up the stairs to buy sex late into the night. A child has few defenses here, and although we’re told that the boy’s gender gives him some protection from sexual abuse, he’s still at severe risk.” International Justice Mission (2017) reported that according to the National Crimes Bureau of India, there has been a 95.5% increase in the number of trafficking cases registered from 2011 to 2015. The same report documented that in India, there is internal trafficking of children for commercial sexual exploitation (CSE) from one state to another or within states in India, and the country has also emerged as a destination country as well as an international supplier of trafficked women and children for CSE.
Forced Labor

Forced labor practices have been deemed illegal globally by the international law since its inception. The first Forced Labor Convention concerning Forced or Compulsory Labor held in 1930 (No. C29) and adopted in Geneva as 14th International Labor Convention (ILC) session defined forced labor as “all work or service which is exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily.” This Convention came into force in 1932 and mandated that all ratifying states consider the illegal exaction of forced or compulsory labor as a penal offense and be punished as such. It also required that the states ensure the penalties imposed by law to be adequate and strictly enforced.

Child Exploitation for Labor and Other Services

Considering the need to adopt new instruments for the prohibition and elimination of the worst forms of child labor, Convention No. C182 – The Worst Forms of Child Labor – was held in 1999. Convention No. C182 mandated the prohibition and elimination of the worst forms of child labor, requiring national and international action, international cooperation, and assistance, to complement the Convention and the Recommendation concerning Minimum Age for Admission to Employment, 1973. It asserted that the effective elimination of the worst forms of child labor requires immediate and comprehensive action to recognize the importance of free basic education and the need to remove the children concerned from all such work. It also mandated that the ratifying states need to provide for the affected children’s rehabilitation and social integration while addressing the needs of their families.

According to this Convention, the worst forms of child labor comprise:

(a) All forms of slavery or practices similar to slavery, such as the sale and trafficking of children, debt bondage and serfdom, and forced or compulsory labor, including forced or compulsory recruitment of children for use in armed conflict
(b) The use, procuring, or offering of a child for prostitution, for the production of pornography, or for pornographic performances
(c) The use, procuring, or offering of a child for illicit activities, in particular for the production and trafficking of drugs as defined in the relevant international treaties
(d) Work which, by its nature or the circumstances in which it is carried out, is likely to harm the health, safety, or morals of children

The International Labor Organization (2015) reiterates the definition of child labor as defined by the Worst Forms of Child Labor Convention (No. C182). It summarizes “child labor”: 
as work that deprives children of their childhood, their potential and their dignity, and that is harmful to physical and mental development.

Convention on the Rights of the Child and other relevant international conventions define child laborers as 5- to 11-year-olds engaged in economic activities, 12- to 14-year-olds who work (in economic activities) for 14 or more hours per week, as well as children who carry out hazardous unpaid household services. It also asserted that some of the worst forms of child labor are covered by other international instruments, in particular the Forced Labor Convention, 1930, and the United Nations Supplementary Convention on the Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery, 1956.

The International Trade Union Confederation (ITUC 2008) reported that “Child labor is often defined as work that deprives children of their childhood, their potential and their dignity, and that is harmful to physical and mental development.” Thus, any work that jeopardizes children’s mental, physical, social, and/or moral well-being by denying them normal childhood activities, interfering with school attendance, requiring them to combine school attendance with excessively long and heavy work, and/or leaving them to fend for themselves at a very early age is considered child labor. It may also involve child slavery, separation from their families, exposure to hazardous working conditions, as well as children left to fend for themselves on the streets of large cities – often at a very early age.

Nature and Extent of Child Labor Trafficking in India

The latest Census of India (2011) reported that India had 259.6 million children in the age group (5–14) years, and of these, 10.1 million (3.9% of total child population) are part of the labor force, either as “main workers” or as “marginal workers.” In addition, more than 42.7 million children in India are out of school. India is one of the leading countries in Asia for child labor trafficking and has 33 million children employed in various forms of child labor (ILO 2017). The UNICEF Annual Report on India (2017) related that child labor constitutes 13% of the workforce in India. According to the United States Department of Labor (DOL) (2014), India is one of the countries that has a substantially large number of children being exploited for labor and sex. Some of these children are victims of exploitation in India, and others are trafficked to other countries including the United States. Another report by the International Confederation of Free Trade Unions (ICFTU 2008) revealed that there are over 60 million children under the age of 14 working in India’s agricultural, industrial, and commercial sectors. Some of these child laborers are as young as 4–5 years old. These children work long hours under horrific conditions, and their remuneration is only food and squalid living quarters. Their adherence to these atrocious working conditions assures that they do not die of starvation.

According to the most recent National Census data (2011), 4,353,247 children between the ages of 5 and 14 worked for 6 or more months during the years of 2001–2011 (Ministry of Labor and Employment, Government of India 2014). The
same Census data reported 3,875,234 children between the ages of 5 and 14 worked for 3–6 months during the year, while 1,900,182 children ages 5–14 worked for less than 3 months. The Bureau of International Labor Affairs for the United States Department of Labor (2015) reported that there are 3,253,202 (approximately 1.4%) children between the ages of 5 and 14 who are working in various industries and in many cases, these children are forced to work long and arduous hours in horrid conditions.

International Laws and Conventions and Child Labor Trafficking in India

International laws and conventions for the protection of children have not had much impact on children’s well-being in India. It is only very recently that India ratified the Minimum Age Convention, 1973 (No 138), of the International Labor Organization (ILO) (Kari Tapiola – ILO 2018). A report by UNICEF India (2017) reveals that majority (80%) of child laborers in India work in rural areas, and three out of four of these children work in agriculture and other small household industries such as carpets and clothing, brick kilns, and domestic staffing. These are home-based employments and thus not subject to government inspections, legal protections, or minimum wage requirements. Nina Smith, a Chief Executive of GoodWeave International (cited in Washington Post, August 21, 2017), stated that, “There is a huge workforce that is unregulated, does not really benefit from labor laws, and is highly vulnerable to exploitation” (see https://www.washingtonpost.com/news/wonk/wp/2017/08/21/child-labor-the-inconvenient-truth-behind-indias-growth-story/?utm_term=.2550a455234b). Thus, even today when the Constitution of India has provisions for protection of children and the ILO Minimum Age Convention, 1973 (No. 138), has been ratified by India, children’s state remains deplorable. Thousands of children in India are still forced to work jeopardizing their mental, physical, and psychological development (see details in Fig. 1). Figure 1 shows an overall decrease in child labor in India from 2001 to 2011. However, the numbers almost remain the same. There has been decrease in child laborers working in rural areas but increase in urban areas. In 2015 Child Rights and You (CRY) reported that the number of male child laborers in the urban areas grew by 154%, whereas the number of female child laborers grew by 240%.

According to the most recent list “The 2018 List of Goods Produced by Child Labor” published by the DOL (2018), India involves child labor in the manufacturing of the following goods: bidis (hand-rolled cigarettes), brassware, cotton, fireworks, footwear, gems, glass bangles, incense (agarbatti), leather goods/accessories, locks, matches, mica, silk fabric, silk thread, soccer balls, sugarcane, thread/yarn, bricks, carpets, cottonseed (hybrid), embellished textiles, garments, rice, and stones. The DOL (2018) reported that 25% of the world’s mica production originates from the Indian states of Bihar and Jharkhand, where child labor and hazardous working conditions are pervasive in informal mining and collecting operations which have not been permitted by the government.
The Guardian (2015) reported that children as young as seven are used as servants in homes of rich people where they are physically beaten and made to live under appalling conditions with little food as payment for more than 18–20 h of work. Thousands of children are being trafficked from India’s remote rural areas and sold into work in cities, often as domestic staff for wealthy families. According to the same report, millions of children are exploited and forced to work as laborers in various businesses and industries such as restaurants, silk industry, carpet weaving, firecracker units, stone quarries, cement factories, brick-making industry, farms, and carpet industry among other small unregulated home industries. In rural areas and villages, children are forced to work in agricultural sector such as farming, livestock rearing, forestry, and fisheries. According to another recent report, children under the age of 14 make up the 4% of the total labor force in India. More than 80% of these children are engaged in traditional agricultural activities, and others work in manufacturing, service, and repair industries.

Table 1 presents the number and percentage of children between the ages of 5 and 14 working in three main labor categories—agriculture, industry, and service. (Children in India engage in the worst forms of child labor, including in forced labor producing garments and quarrying stones. Children also perform dangerous tasks in producing bricks. Table 1 provides key indicators on children’s work in India (also see https://www.dol.gov/agencies/ilab/resources/reports/child-labor/india).
Interregional child trafficking is also rampant in India – where children are trafficked within India from rural to urban and/or one province to another for commercial and sexual exploitation, forced labor, domestic servitude, as well as use in armed conflict. (US Department of State 2014). In many cases India’s rural families send their children to work in industries, such as carpet making, spinning mills, and cottonseed production, where they are forced to work in hazardous environments for little or no pay (Kara 2014; Theuws and Overeen 2014). However more recently due to globalization and augmented wealth of some in urban areas where demand for house servants has increased, another form of child trafficking for labor – domestic servitude – has emerged (The Guardian 2015). Children are recruited/kidnapped or bought and then trafficked from remote rural areas to cities where there is demand for domestic servants. Here, they are forced to work as servants for rich families under horrendous working conditions. According to a recent newspaper report (Huffington Post 2015), thousands of children are trafficked from India’s remote rural areas and sold into work in cities, often as domestic servants for wealthy families. Phoolka, a senior advocate at India’s Supreme Court and a human rights lawyer and activist, stated that rising demand for domestic maids by rich in urban areas has given rise to a new form – trafficking children for domestic slavery (The Logical Indian 2016). Children from marginalized groups – such as low-castes, members of tribal communities, and religious minorities – are more likely to be the victims of forced labor, human trafficking, and commercial sexual exploitation (Kakar 2016). The US Department of State (2014) and the United National Security Council (2014) reported that the states of Bihar, Chhattisgarh, Jharkhand, and Odisha trafficked children to serve as soldiers in Maoist armed groups. Often children are recruited, and in some cases kidnapped, to fight in armed liberation groups in the northeastern states of Assam and Manipur. Insurgent separatists and terrorist groups from war-torn regions such as Jammu and Kashmir are known to forcibly recruit children to launch attacks against the Indian Government.

In some cases, abject poverty drives poor families to make tough decisions, and they voluntarily sell children in exchange for money. These children are then “resold to the highest bidder” to work in homes as servants, industries as workers, and brothels and other similar establishments as prostitutes. Trafficked children are forced to work in several labor sectors. Table 2 provides an extensive overview and description of the subcategories of various sectors in which underage children are forced to work. For example, the agricultural sector includes “farming” – inclusive of producing hybrid cottonseed and hybrid vegetable seeds, cultivating cotton, cultivating chili pepper and rice, and harvesting sugarcane, tobacco, and tea as well processing cashew nuts and seafood (DOL 2018).

A complete list of sectors and their subsectors where children ages 5–14 are forced to work and the list of activities they perform in each sector is provided in Table 2.

**Dynamics of Child Labor**

Despite the growing international concern over the deplorable state of children in the world and many concerted international as well as national endeavors in form of laws, conventions, mandates, and provisions, child trafficking for labor and sex is thriving. New forms of trafficking emerge as efforts are made to address the existing ones. The data presented in this chapter revealed that children are exploited for labor and/or other services in and outside of India. In addition to international and national entities denouncing it, India’s Constitution includes provisions and laws for protection of children from any form of exploitation. Nevertheless, it remains prevalent. This section discusses some of the dynamics that may explain why these practices thrive.

Child trafficking for labor in India is a multifaceted problem. It appears in varied forms and the causes for the incidence are also multifaceted. It is intertwined into the social, structural, historical, economic, and cultural fabric of India in a complex manner. Empirical evidence suggests that generally structural factors – socioeconomic status, lack of educational and employment opportunities, political corruption, and inequitable social conditions – are some of the main causes of child exploitation for labor. In the Indian context, the explanation becomes much more complex and intriguing because historical, religious, social, and cultural dynamics lay the foundation of a convoluted social structure that reigns India. Exploitation and servitude are main elements of the Indian social and economic structure. The caste system in India has in built culture of servitude, paternalism, and marginalization giving rise to a culture that binds the “exploiter” and the “exploited” in a special obligatory bond that is not only accepted but rather perpetuated by the exploiter and the exploited alike. Caste system allows inbuilt paternalism to frame servitude in familial terms, with the landlord as the caring parent and the laborer as the child obligated to do what he is asked without question (Choi-Fitzpatrick 2017).

\(^a\) Determined by the national law or regulation as hazardous and, as such, relevant to Article 3(d) of ILO C. 182

\(^b\) Child labor understood as the worst forms of child labor per se under Article 3(a)–(c) of ILO C. 182
Social, Cultural, and Structural Dynamics

India’s socioeconomic culture is a derivative of long-standing cultural practices of exclusion and divisions based on birth and ancestry. It is an artifact of ancient class relations that are reinforced by deep-seated cultural biases which are at the forefront of class and caste structures – where lower class is often at the mercy of the upper class for survival. Such social stratification based on ancestry creates rigid and impenetrable social classes where entry or exit from one to the other is impossible as one’s place in the social strata is determined by birth. These practices have led to the social exclusion of the lower classes from the mainstream society, from educational opportunities and decent jobs – immortalizing intergenerational poverty among people from lower classes – making them socially, economically, and psychologically marginalized and vulnerable to exploitation by the upper classes. Choi-Fitzpatrick (2017:132) eloquently describes this in the following statement:

Servitude is normalized and “legitimized ideologically such that domination, dependency, and inequality are not only tolerated but accepted and are reproduced through everyday social interaction and practice.” In such a cultural space it becomes “virtually impossible to imagine life without it, and practices, and thoughts and feelings about practices, are patterned on it.

Ancient atrocious cultural caste system still exists, and the artifacts of this system have resulted into caste oppression that has marginalized and exploited Dalit community socially, economically, and psychologically. “Though protections exist in Indian law, they are seldom enforced as caste hierarchy is mirrored in the bureaucratic, police, and court systems” (Navsarjan Trust 2017). Despite laws prohibiting such conduct, socially excluded classes are forced to perform jobs traditionally considered dirty and impure and “are constantly subjected to egregious violence, dehumanizing labor and a pervasive system of social exclusion” (also see https://www.justice.gov/sites/default/files/oir/legacy/2014/02/04/IND104063.E.pdf). A range of sources maintain that Dalits continue to suffer discrimination – described as “deep” (The Guardian 8 Feb. 2012), “widespread” (Hindustan Times 23 Nov. 2010), and “prevalent” (US 8 Apr. 2011, 58) – based on caste and the practice of untouchability, even though it is illegal (ibid.; Hindustan Times 23 Nov. 2010). Untouchability, a “direct product of the caste system” (Navsarjan n.d.c) means that Dalits often live segregated from the caste communities (ibid.; The Guardian 8 Feb. 2012; Hindustan Times 23 Nov. 2010). They are reported to be typically denied access to public wells, must use separate cups for drinking, and are denied entrance into temples, among other restrictions (Navsarjan n.d.c.; NCDHR n.d.a). Dalit rights groups indicate that the practice of untouchability also affects Dalits in schools (Navsarjan n.d.c.; NCDHR n.d.a). For example, Dalit children may be required to clean toilets, eat separately from the other children (Navsarjan n.d.c), or sit in the back of the classroom (NCDHR n.d.a). As well, Dalits attending higher educational institutions have reportedly been subject to “caste-based discrimination,” driving some Dalit students to suicide (The Globe and Mail 2 Dec. 2011; The Chronicle of
Debt Bondage: Child Labor

The ancient and convoluted social stratification system still dominates the social landscape of India. Often cloaked under false affectations of religion, it is enforced to maintain the status quo of the upper classes and hold lower classes in inescapable cycles of persistent poverty and bondage. Child exploitation in India is an offshoot of these ancient practices of social and cultural exclusion. Children born to the lower-class families are often used as bonds— as an assurance of debt re-payment— for the debt incurred by their ancestors (ILO 2010). The initial debt is often incurred through an amount of money borrowed as a small loan from subcontractors. The deceptive lending practices and enormously high interest rates keep increasing the principal and a small amount of money borrowed as the initial debt keeps growing at an exponential rate. The debt is then assigned to the entire family and is not nullified even in death. This means children are forced to repay the surging debts of their deceased parents. The initial small loans get transformed into large debts over time— leaving children, families, and the future generations in the state of debt bondage (ILO 2013; Choi-Fitzpatrick 2017). The majority of these marginalized and enslaved families are predominantly from the lowest and the condemned social strata (Kakar 2016; Ghose 2003).

Child exploitation or forced labor is the principle form of slavery in India. Traditionally limited to agriculture industry and rural areas, it has morphed into varied contemporary forms and pervaded almost all industrial sectors of India. It continues to thrive both in rural and urban India despite its illegality (ILO 2015). The debt bondage of laborers exists in many forms. It becomes intergenerational when the burden of labor and debt is transferred to the next generation (Kakar 2016).

Urbanization

Many of the lower-class families migrate from rural areas to cities in search of employment in industries, such as brick kilns, carpet making, spinning mills, and cottonseed production. In the cities, these newly arrived families find themselves in streets without any food to eat or any place to sleep. They and their children become easy targets for exploitation in labor and sex industry. To survive, many times they are obligated to work in hazardous environments for little or no pay. Children as young as four are found working in squalid conditions according to one of the NGO’s reports on “blood bricks” (Global March – 2012).

As discussed earlier, child labor trafficking thrives despite international and national legal protections. ILO (2017) reported, “… inequality, lack of educational
opportunities, slow demographic transition, traditions and cultural expectations all contribute to the persistence of child labor in India.” It impedes children from growing naturally, gaining the skills and education they need to have opportunities of decent work as adults. They are exploited for labor and sex by their families as well as strangers in their home country and foreign countries. The social, cultural, and structural dynamics of India silently acquiesce such a state of children, and they are subjected to the worst forms of exploitation. Their rights are trampled upon, and they are treated as commodities to be sold and bought for profit. In many cases they are bonded in slavery even before they are born (Kakar 2016).

Suggestions for Control and Prevention

The devastating aftermath of child exploitation is felt in all aspects of children’s lives. It thwarts their physical, mental, and psychological growth. Inequality, lack of educational opportunities, slow demographic transition, traditions, and cultural expectations all contribute to the persistence of child labor in India (Kakar 2016). Their lack of education limits their opportunities for any meaningful employment and leads them and their families to remain in perpetual poverty and bondage.

Given such a state of affairs, it is incumbent upon Indian as well as international entities to prevent continuation of child trafficking. India has made some endeavors to rectify the situation. For example, India has ratified most key international conventions concerning child labor, including its worst forms such as ILO C138, Minimum Age Convention; ILO C182, Worst Forms of Child Labor; UN CRC Optional Protocol on Armed Conflict to assure that underage children are not recruited to serve in the army; and UN CRC Optional Protocol on the Sale of Children, Child Prostitution, and Child Pornography to prevent child exploitation for sex and other related activities.

In 2013, the Ministry of Home Affairs launched the Criminal Tracking and Networking System on a pilot basis. This system connects all of India’s 15,000 police stations and enables the police to monitor trends in serious crimes better, including trafficking (Ministry of Home Affairs 2013). In 2013, the government established 100 new antihuman trafficking units across India to bring the total number of Anti-human Trafficking Units to 300 (US Department of State 2013).

According to the United States Department of Labor report issued for the Bureau of International Labor Affairs in 2014, India made some moderate efforts to eliminate the worst forms of child labor. The Government of India implemented the National Child Labor Project to develop strategies in order to assist child laborers. As a result, programs such as loans, provision of alternative means of livelihood, as well as social policies and programs were developed to address the underlying causes of child exploitation. To coordinate efforts of state and national government agencies, the Ministry of Home Affairs for India (2013) launched an online human trafficking portal.

The irony is that despite many existing and new laws on books, exploitation of children in India persists. A report, “Campaigners concerned as India delays tough
new anti-trafficking law” by Reuters (2018), testified that India already has laws to prosecute employers and middlemen involved in debt bondage, as well as pimps and brothel managers in sex trafficking cases. However, social and cultural acquiescence and indifference to the plight of the victims who are generally from “marginalized classes” known as “Dalits” and often considered “impure” “untouchables” and “outlawed” the laws have not transcended to them. Consequently, trials are often drawn out and trafficking survivors’ rights to benefits like cash compensation, housing, and free education for children are often ignored or denied (also see https://www.foxnews.com/opinion/human-trafficking-will-not-end-until-it-ends-in-india).

The discrimination and oppression – the artifacts of caste culture – persist today and defunct the new laws leaving the socially, economically, and psychologically marginalized, mostly the Dalit Community, in the same or worse situations. Deshpande (2016 as cited in the Global Slavery Index) articulates it, “Discrimination against Scheduled Castes, Dalits, and Scheduled Tribes is still a characteristic of the modern and globalizing Indian society, with reports that it is becoming more evident in urban areas.” A great number of children are still forced to work in hazardous industries under horrific conditions. Instead of attending schools, they are found working in agriculture, manufacturing, and various other industries. India needs to do more to protect children and end the atrocities inflicted on children. The social structure revolves around the vicious circle of perpetuating exclusion at all costs. Lerche (2007) reports that economic marginalization along with social and cultural exclusion compounds the unequal power dynamics between marginalized groups, government, and dominant groups who usually own or manage worksites. Such a complex system emasculates emerging efforts and laws.

This section discusses some strategies and suggestions for controlling and preventing child labor exploitation.

**Modification and Enforcement of Existing Child Protection Laws**

One of the most distinctive suggestions would be to criminalize child exploitation and punish the violators. However, India already has several existing laws that promise to protect children against any and all forms of exploitation. Article 24 of the Indian Constitution prohibits employment of children below the age of 14 in factories, mines, and other hazardous employment. Article 21A and Article 45 promise to provide free and compulsory education to all children between the ages of 6 and 14. In 2009, India passed the Right of Children to Free and Compulsory Education Act (RTE). In 2016, the Child Labor (Prohibition and Regulation) Amendment Act (CLPRA) amended original 1986 Act, and it states the purpose of the amendment to be:

An Act to prohibit the engagement of children in all occupations and to prohibit the engagement of adolescents in hazardous occupations and processes and the matters connected therewith or incidental thereto.
This act prohibits “the engagement of children in all occupations and of adolescents in hazardous occupations and processes,” wherein adolescents refer to those under 18 years and children to those under 14. The Act also imposes a fine on anyone who employs or permits adolescents to work. However, most of these laws have some flaws and more importantly not enforced equitably. For example, Section 3 in Clause 5 of CLPRA allows child labor in “family or family enterprises” or allows the child to be “an artist in an audio-visual entertainment industry” allowing families to engage their children in work. Since most labor is performed by lower classes, this act provides little protection for children from poor families that comprise of 80–90% of the child labor. They are still deprived of their constitutional rights and protections. Additionally, the clause does not define the hours of work – thus children can still be exploited to work and work long hours with immunity. In addition to the RTE and Article 45, Plantation Labor Act (1951) in the northeastern states of Bengal and Assam mandates free education to all the child laborers working in tea gardens, yet these rights and protections have not been extended to children (Goswami 2018).

In order to protect children against exploitation in the true sense, the acts and laws need to be clear and unambiguous about protecting children. For example, CLPRA 2016 contradicts the Juvenile Justice (Care and Protection) of Children Act (JJCP(C) of 2000 and violates the International Labor Organization’s (ILO) Minimum Age Convention and UNICEF’s Convention on the Rights of the Child, to which India is a signatory. The JJCP(C) (2000) defines a child as anyone who is under 16 years of age, while the RTE (2009) defines children as 6- to 14-year-old, and CLPRA (2016) defines a child as someone under 14 years of age. Such a lack of one uniform and distinct definition of a “child” not only causes confusion but also sanctions manipulation and exploitation to forcefully alienate children from the main society. Such practices tacitly acquiesce perpetuation of intergenerational poverty and inequality. For the laws to be effective, there should be clear and concise definition of who is a child and the type of employment and number of allowable work hours for them. More importantly these laws should rise above the caste hierarchy and be enforced objectively and equitably.

**Efforts Should Begin at the Grassroot Level**

A socially and culturally diverse society like India that is meticulously organized by a callous system of class, caste, and gender to maintain the status quo of classes requires more than Supreme Court and Constitutional provisions for children’s protection against exploitation. Intervention efforts should carefully consider the contextual complexities of the Indian society. Its multidimensional complexity requires similar complex intervention, education, and training. The efforts need to be designed to effectively remove children from hazardous work.

The underlying contextual factors such as poverty and inequity interwoven in the cultural, social, political, and economic environment and class-based society must be addressed with practical solutions. Legislation needs to be explicit, and enforcement
must be unequivocal devoid of class, caste, and religious undertones. To actually realize the full potential of these laws and protect children, the efforts need to be concerted, collaborative, and unwavering and begin at the ground level. Efforts by Kailash Satyarthi, the Nobel Laureate, such as “Bachpan Bachao Andolan” (Save the childhood Movement), are some of the grassroot efforts’ examples to eradicate such atrocities as child exploitation and child labor, working along with the authorities to ensure that the existing laws are followed and justice is meted out to the perpetrators and offenders. More importantly efforts need to focus on eradicating the precursors leading to child trafficking.

Goals set by the United Nations for India propose feasible and sustainable development goals. These sustainable goals such as #1 propose to eradicate poverty – which generally is one of the most important factors contributing to child trafficking. Similarly goal #8 proposes strategies for decent work and economic growth, and #16 proposes peace, justice, and strong institutions (United Nations 2016). India needs to endeavor to follow and maintain these sustainable development goals.

Abstract

Over the past decades, numerous reports have emerged suggesting that children from poor countries are being obtained illegally and transported transnationally in order to meet the high Western demand for adoptable healthy babies. This chapter identifies the structural components of the transnational illegal adoption market by applying the basic logic of the routine activity theory that has been developed by Cohen and Felson. It explains that in the context of extreme inequality (“criminogenic asymmetries”) between the sending and the receiving countries, supply, demand, as well as weak public and private sector social control mechanisms have contributed to the nature and size of the illegal adoption market. The chapter outlines the main difference between conventional forms of human trafficking and child trafficking for adoption purposes and explains why the latter phenomenon is particularly difficult to detect.

Introduction

The last half-century has seen the emergence of an illegal market in adoptable children. Numerous reports have emerged, illustrating that children are being kidnapped or purchased from poor families in developing countries and then transferred to Western states to be placed with involuntarily childless couples and individuals. A great body of criminological research has dealt with the issue of human trafficking; however, so far the phenomenon of trafficking in children, for the purposes of adoption, has totally escaped the attention of criminologists. This might also be due to the fact that the purchasing, kidnapping, and selling of children for adoption purposes is still not considered a form of human trafficking by the 2000 UN Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children and by most national criminal laws. Even if the children have been obtained by fraudulent means, the ultimate objective is to place them with adoptive families who wish to care for them. Adoption per se does not amount to exploitation: the third constituent element of human trafficking. This chapter seeks to fill this criminological gap. It identifies the organization and operation of the illegal transnational adoption market in children by applying the basic logic of routine activity theory that has been developed by Cohen and Felson (1979). It explains that in the context of extreme demographic as well as economic inequalities between the sending and the receiving countries (“criminogenic asymmetries”), demand, supply, and weak public and private sector social control mechanisms have contributed to the nature and size of the illegal adoption market. The chapter outlines the main differences between conventional forms of human trafficking and child trafficking for adoption purposes, and it seeks to explain why the latter phenomenon remains particularly invisible.

The Basic Logic of Routine Activity Theory

In order to understand the organization of the transnational illegal market in children, it is important to identify its structural components. The basic logic of routine activity theory offers a means to conceptualize this market. Routine activity theory was developed by Cohen and Felson (1979) in order to explain the behavior of individuals engaged in predatory street crimes (e.g., robbery, burglaries, larcenies, or murders). Routine activities refer to the “recurrent and prevalent” activities of individuals in everyday life (e.g., work, leisure, social interaction) (Cohen and Felson 1979: 593). The premise of the theory is that crime is the product of three minimum elements that converge in space and time in the
course of the population’s routine activities: (1) motivated offenders, (2) suitable targets, and (3) the absence of capable guardians. The first element refers to offenders with both criminal inclinations and the ability to carry out the crime. Target suitability refers to a target’s qualities, such as the value of a person or property, physical visibility, access to them, as well as resistance capability. A capable guardian is someone with the capacity to stop or impede a crime, one in whose presence the crime is not committed and whose absence makes it more probable. This definition includes formal third parties (e.g., police officers or security guards), as well as informal ones (any private person).

Routine activity theory is a micro-level theory that was developed and employed to explain why individuals engage in criminal activities. Nonetheless, criminologists have applied its basic logic to structurally analyze illegal transnational markets. For instance, Lane et al. (2008) have transposed the theory’s three components into structural equivalents so as to analyze the market in illegal art and antiquities. According to them, this market is a patterned system of economic exchange that consists of three factors: demand, supply, and regulation. Thus, from a structural market perspective, motivated offenders constitute the demand component, whereas suitable targets constitute the supply component of the illegal market. The absence of capable guardians then involves both weak public sector and private sector social control mechanisms, which establish the necessary link between the demand and the illegal supply component.

In the following paragraphs, the basic logic of routine activity theory will be applied to structurally analyze the transnational illegal market in adoptable children. It will be explained that the adopters and adoption agencies in rich Western countries constitute the demand component, whereas a large number of poor families and orphanages caring for children in the developing countries form the supply component. In order to meet the high demand for adoptable children, children are illegally obtained from their birth families or from orphanages caring for them. Demand and illegal supply are then being connected by individuals and organizations from both the public and private sector that ought to serve as legal guardians in the adoption system but who misuse their function to launder children through legitimate channels.

**Demand Component**

Intercountry adoption, meaning the transnational movement of children for the purposes of adoption, is a fairly recent phenomenon that developed in the second half of the twentieth century as a humanitarian response to World War II and the Korean and Vietnam Wars (Altstein and Simon 1991). Initially, the motivation to adopt a child internationally has mainly revolved around an altruistic core. Adopters, many of which already have biological children, considered intercountry adoption as an important measure to rescue children from atrocities and destruction in war-torn regions or from poverty and neglect in so-called “Third World” countries (Hoksbergen 1998).
Since the 1980s, however, the adopters’ own interests and needs have begun to play a more prominent role in the intercountry adoption system (Hoksbergen 1998; King 2008). In Western societies, the number of couples and individuals who would like to be parents but who are unable to have a biological child was rising, particularly due to the increased use of contraception and the later age at which couples attempt to have their first child (Högbacka 2008). Many so-called involuntarily childless thus seek to create their own families through adoption.

However, the number of children available for adoption in Western countries has fallen since the 1970s due to liberal abortion politics, widespread use of contraception, and the increasing acceptance of unwed motherhood. Hence, the adoption of a child from a foreign country has become an attractive (and often last resort) alternative for many involuntary childlessness (Fleisher 2003; Högbacka 2008; Nelson 2006). The decrease in the number of domestic adoptions strongly correlates with the increasing number of intercountry adoptions in all Western countries. Whereas in the 1970s, intercountry adoption was mainly considered as a child care measure, it gradually became a remedy for involuntary childlessness as of the 1980s. Most adopters wish to adopt a child that is younger than 2 years old, and they are not willing to accept an orphan with a disease. Therefore, young and healthy girls are in particular high demand. Adopters’ demand exerts an inexorable pull on the healthy babies of child-rich countries (Marijnen and Doomernik 2015).

Moreover, adoption agencies in receiving countries play an important role on the demand side of the transnational adoption market, as they channel and intensify the adopters’ pressure on the sending countries. Many adopters decide to use the services of an adoption placement agency in order to pursue an intercountry adoption. Although the adoption agencies repeatedly stress that their main mission is to find parents for children, and that they exclusively serve the best interests of the child, they effectively act as representatives of the adopters which seek to find suitable children for their paying clients. Adoption agencies commonly allow the applicants fill out a checklist indicating their preferences concerning, among other things, the child’s age, origin, health status, and sometimes gender, which serves the agencies as a basis for their placement services. They seek attractive source countries, negotiate placement quotas with the local institutions and organizations, and make sure that the proposed children actually comply with their clients’ preferences (Goodwin 2010).

However, the pressure on the supplying states does not only originate from the adoptive parents, it also emanates from the adoption agencies themselves. In many receiving countries, adoption agencies are accredited private bodies that do not receive any subsidies and therefore have to cover their expenses exclusively with the fees paid by the adopters. This means that the agencies’ existence is dependent on the number of intercountry adoptions they place. Due to this dependency, agencies put pressure on the sending countries to send more children for adoption. Arguably, this pressure has further increased since the number of international adoptions started to decline in 2004 for reasons that will be explained below.
Supply Component

Whereas adopters and adoption agencies in the wealthy Global North (primarily the United States, Western European countries, and Canada) constitute the demand component, large numbers of poor families and orphanages caring for children in low-income countries of the Global South (and postcommunist Eastern Europe) form the supply component of the adoption market. In 2015, China, Russia, Ethiopia, Guatemala, and Colombia were the most significant sending countries in terms of children sent abroad, followed by Ukraine, South Korea, Vietnam, Haiti, and India (Selman 2017). The reasons why there are children in need of a family or care in these countries are basically independent of the demand: wars, natural disasters, extreme poverty, AIDS, religious and cultural traditions (e.g., stigmatization of unwed mothers), and changes in economic and social policies (e.g., the collapse of communist-era welfare systems in Eastern Europe, the introduction of the one-child policy in China) (Högbacka 2008). Commonly, a combination of these factors, as well as expedient and bureaucratic adoption procedures, makes a state an attractive source of children for intercountry adoption.

Since the 1990s, the number of intercountry adoptions has constantly risen, peaking in 2004 with approximately 45,000 placements. This rise, Selman (2016: 24) explains, “seems in many ways to have been driven by an increasing ‘demand’ for children, fuelled by the apparent steady increase in the number of children available in China, Russia, and Guatemala and the opening up of possibilities for adoption by single individuals.” However, since 2005, the number of intercountry adoptions fell to some 12,000 in 2014 (Selman 2017). This decline is particularly attributable to the suspension of intercountry adoptions by Guatemala in 2008, as well as to the restriction in the number of children sent by China and Russia (Selman 2016). Several factors had caused the drop in intercountry adoptions from previously significant source countries, including economic developments, stronger reliance on domestic adoption, as well as reports about illegal and abusive adoption practices, which often resulted in stricter adoption procedures (Smolin 2010).

Conflicts, natural disasters, extreme poverty, and epidemics leave numerous children worldwide extremely vulnerable. However, only a small fraction of them are deprived of their family environment and thus legitimately available for adoption. This reality runs contrary to the belief that there are millions of children around the world who desperately need parents (ISS 2008). The Western myth of a “global orphan crisis” is created by estimates on orphans, institutionalized children, and street children (e.g., UNICEF 2016), which are often misinterpreted to stress the urgency to adopt internationally (Cheney and Rotabi 2015; Graff 2008). Yet, the majority of these children are not orphans in a legal sense (meaning that they have lost both their parents), but they have at least one living parent or grow up in an extended family network – an acknowledged form of child care in many traditional societies (Broad 2007). Furthermore, most of those children who actually need a family are not attractive adoptees, as they are already older, sick, or more traumatized than most adopters are willing to accept (Joyce 2013).
In order to meet the high Western demand for healthy babies, actors in the supplying countries employ a variety of illegal means to generate “adoptable” children. In some sending states, citizens, including independent agents, attorneys, and orphanage directors, establish a system for purchasing children from their birth parents. They send out intermediaries, generally of a lower social status, serving as scouts or recruiters who would approach impoverished families and potentially vulnerable pregnant women or mothers – often young, poor, and unmarried – and incite them to give up their future or newborn child (Commission on Human Rights 2000; Smolin 2006). Consent to relinquishment is not given freely but induced by psychological pressure and financial or material rewards. The parents may be told that they are not suitable persons to raise a child and that they should give their future or newborn children the opportunity to have a better life than themselves (UNICEF 1998). Such pressure may be reinforced by the reward of money or goods (Smolin 2006).

Another method to illegally obtain children is the deception of biological parents to obtain their consent to adoption. Here, biological parents are intentionally provided with false information about the consequences of an adoption in order to obtain their consent (UNICEF 1998). They may be told that their child is only going away for educational purposes or on a temporary basis, or they may be promised that they can keep in contact with their child, receive payments and letters from the adoptive parents, or that they will be allowed to follow their child to the Western nation once the child has grown up (Smolin 2006). In other cases, birth parents are urged to sign paperwork relinquishing their parental rights without fully understanding the concept of “relinquishment” that is based on a culturally foreign, exclusivist nuclear family model (Wereldkinderen and Against Child Trafficking 2009).

Furthermore, there are cases where children are being obtained through kidnapping or abduction. The children are either being kidnapped from the streets, hospitals, and their homes or abducted from orphanages, hostels, or schools where they have been placed temporarily by their parents for purposes of education or care (Dickens 2002; Fuentes et al. 2012). Poor families commonly use these institutions as a safety net without intending to sever their parental rights or ties (Cheney and Rotabi 2015). They either place their children into an institution on their own initiative for a period of time, during which they are not able to care for them due to financial or other reasons, or the children are deliberately recruited into such an institution on the basis of false pretenses (Smolin 2006).

In other incidences, birth mothers are fooled into thinking that their newborn children were stillborn or died shortly after birth, while in reality the babies are being abducted from the hospitals or maternity clinics (UNICEF 1998). Furthermore, there is the scenario of child abduction in the aftermath of a natural disaster or in a conflict situation where “lost” or “missing” children are being placed for intercountry adoption without any efforts having been made to find their birth parents or relatives (King 2012).

adoption should only be considered for a child deprived of his or her family environment, if no domestic child care solution can be found. In a number of instances, the subsidiarity principle has been violated in the sending countries: directors of child care institutions or government officials – bribed by adopters and adoption agencies – approved an intercountry adoption even though there were sufficient families in the child’s native country on the waiting list for foster care or adoption (Hoelgaard 1998; Meier and Xiaole 2008; Post 2007; Smolin 2011).

Social Control Component

In order to sustain an illegal transnational market in adoptable children, a diverse set of demand and supply sources is necessary. However, demand and supply sources alone are not sufficient; it is equally important that these sources are securely linked. Connecting buyers and sellers with each other is crucial, which is organized differently than in conventional forms of human trafficking.

There is at least one important feature that immediately distinguishes the trafficking in children, for purposes of adoption, from other forms of human trafficking. Whereas the purpose of conventional forms of human trafficking is illegal (e.g., sexual exploitation, organ removal, slavery), adopting a child is perfectly legal at the demand end of the system. An adoption only becomes illegal when the child has been obtained illegally. Therefore, the illicit means by which children were obtained must be disguised: a laundering process is crucial here. Just as crime proceeds and “dirty money” are laundered, illegally secured children must be purified in order for them to be profitable (Smolin 2006).

There are two ways to launder a child. The first one involves the adopters, who bypass the adoption system by trafficking the illegally obtained child as their biological child, after having the child’s birth certificate falsified or fabricated. These adoptions are commonly referred to as “illegal adoptions” (Boele-Woelki et al. 2011). The adopters circumvent the adoption procedure because they do not fulfill the adoption requirements as they are too old or because they are not willing to take on the long waiting times and bureaucratic hurdles in an adoption process. Often they use a private contact as an intermediary who locates a child and then assists them in the laundering process. Adoptive mothers may have the child’s birth certificate issued with their name as the biological mother, or adoptive fathers may wrongfully acknowledge the paternity of an allegedly “illegitimate” child (UNICEF 1998). Sometimes this approach has already been prearranged prior to the child’s birth, involving psychological pressure and/or payments to the pregnant mother (Wuttke 1996). The latter may be involved in the laundering process by registering at a maternity clinic with the name of the adoptive mother. In other cases, birth certificates are issued with the names of the adoptive parents, while the biological mothers were told that their baby was stillborn or died after birth. The adopters may not necessarily be aware of the illegal origin of the child that is presented to them. Their intermediary may tell them that the baby is an orphan or was abandoned.
The second way to launder an illegally obtained child is by passing the child through the adoption system. Again, the child’s birth certificates and other necessary documents (e.g., maternity and paternity certificates, documents containing the birth parents’ consent to adoption, death certificates of the birth parents, rejection letter from domestic adoption applicants) need to be falsified or fabricated in order to hide the illegal conduct and to identify the illegally obtained child as legally abandoned, for which no domestic children care solution could have been found (Fuentes et al. 2012; Graff 2010; Maskew 2004; Meier and Xiaole 2008). As a final step in this laundering process, an illegal decision on an adoption is rendered by a court of law that bears all the hallmarks of a perfectly legal adoption procedure. Cantwell (2005: 1–2) explains:

The “illegality” of that decision could […] result from situations where, variously, the required procedures have not been followed, documents have been falsified, the child has been declared adoptable without due cause or as a result of manipulation, money has changed hands… but if it is truly an adoption, rather than some other form of transfer or removal, it will necessarily and by definition have been approved by a judge. It follows that all events and acts that would make it “illegal” must therefore have taken place up to and including, but not after, the judgement. “Illegal international adoptions”, therefore, are not the same as “illegally moving children abroad”: in cases of the former, children are moved abroad legally following an adoption process that contains illegal elements.

All traces of the illegal adoption will, in most cases, be wiped out at the time when the child arrives in the receiving country, and the adoptive parents, the adoption agencies, and the authorities can plausibly deny knowledge of illegal practices overseas. Only because of the possibility of laundering children can a lively adoption industry actually exist. This need for transforming the status of trafficked human beings is not found in traditional forms of human trafficking. Since the very purpose of human trafficking is illegal, there is no need to “clean” the status of the trafficked persons.

The process of laundering is usually facilitated by legitimate individuals and organizations from both the public and the private sector. For instance, in cases where children are passed off as the adopters’ biological parents, a nurse or doctor may issue the child’s false birth certificate. In cases where children are channeled through the adoption system as “orphans,” the laundering process is commonly facilitated by actors which actually ought to serve as guardians in the adoption system.

Basically, the adoption system’s integrity relies on capable guardians in the form of effective regulatory institutions, which monitor and control the adoption process and make sure that only children that are legitimately available for international adoption enter the system. The drafters of the Hague Convention believed that illegal and abusive adoption practices can best be prevented by increasing capable guardians in the adoption system. Therefore, the treaty obliges its contracting states to designate a Central Authority acting as a gatekeeper through which all intercountry adoptions have to be channeled (Kimball 2005). The Central Authority has to fulfill the tasks outlined in the convention, some of which may be delegated to public
authorities (e.g., youth welfare offices, family courts) or accredited private bodies (e.g., child care institutions, adoption placement agencies).

Yet, as uncovered cases of illegal adoptions have shown, these public sector and private sector institutions do often not serve as guardians in the adoption system, but rather they misuse their knowledge and status to pass the children through their organization (Dohle 2008; Smolin 2004; Stuy 2014). They thereby create the necessary linkage between demand and illegal supply sources by converting illegally obtained children into “orphans” and then “adoptees.” These institutions might not only serve to connect buyers and sellers, but they may also have been involved in illegally sourcing the children for adoption in the first place. For instance, a state-run orphanage might illicitly secure adoptable children (e.g., by circumventing the subsidiarity principle or by sending out scouts) and then falsify the necessary paperwork to hide both the illegal conduct and the children’s real origin (Wacker 2000).

The limited effectiveness of regulatory institutions facilitating the child-laundering process can be traced to widespread corruption and unwillingness to enforce laws in place. A high incidence of corruption in the sending countries is a significant reason for illicit practices within the intercountry adoption system (Smolin 2006). Public officials are accustomed to demanding and receiving payoffs to provide not only legitimate but also illegitimate approvals and services. Generous (by sending nations’ standards) fees and payments from Western adopters and adoption agencies provide ample means for creating an intercountry adoption system, which is greased by bribery. Corruption is the lubricant that enables child laundering to flourish, as it covers up illegal adoption practices, skews the decision-making process, and diverts law enforcement resources.

The cooperation partners and representatives of the Western adoption agencies in the supplying states play a particularly crucial role at the demand-supply nexus. There are different forms of cooperation between adoption agencies and the countries from which they place children for adoptions. These forms of cooperation depend on the laws, as well as structures in the sending states. Typically, adoption agencies established a cooperation with local partner organizations. Sometimes, these organizations are orphanages that are accredited by the sending countries’ authorities to place children for international adoption (HCCH 2012). In other cases, the partner organizations are working as adoption placement agencies with strong links to the local child care institutions. Then there are sending states (e.g., China), where the Western adoption agencies have not established a collaboration with a partner organization but are obliged to directly cooperate with the competent authorities who place the adoption applicants on a “waiting list” and do the matching with a child that becomes available for intercountry adoption (Stuy 2014).

Many Western adoption agencies have representatives in the sending countries who manage the agencies’ representative office or mediate between the agencies and their foreign partner organizations and/or the competent authorities. They are often locals who know the language and are familiar with the adoption laws and procedures in the sending country. The representatives’ qualification and the range of functions to be performed basically differ from body to body, as well as from country to country. Some representatives, like, for instance, those in China, only handle...
bureaucratic matters by translating documents and accompanying the adoption applicants to the official authorities and court hearings. Others play a more proactive role in the adoption process. They have strong contacts with the local child care institutions, which they visit on a regular basis to inquire if there were children in need of an adoption. Moreover, they may be required to undertake certain functions and duties for the authorities in the sending countries (HCCH 2012).

The adoption placement agencies’ foreign cooperation partners and representatives play a crucial role in the adoption procedure, as they are involved in the most crucial phase of the child placement process: the phase between the abandonment or relinquishment of the child and the adoption decision in a court, where most illegal and abusive practices commonly occur. They are important “cogs” in the adoption system, as their working method, ethical stance, as well as understanding of the child’s best interests have a significant influence on the subsequent processes and, ultimately, the resulting adoption. On the one hand, they could – and actually should – serve as guardians that only let those children pass through the adoption system that are legitimately free for intercountry adoption. On the other hand, they may allow illegally obtained children to be laundered through the system (Tribowski and Loibl 2017). As uncovered cases of child trafficking have shown, adoption agencies’ partners and representatives in the sending countries are often involved in abusive adoption practices (Stuy 2014; Wacker 2000). They either illegally secure children for intercountry adoption themselves, launder illegally obtained children through the system, or facilitate abusive practices by other actors and organizations by looking the other way.

Child trafficking for adoption purposes causes deep harm to the children and their birth parents, whose human rights are seriously violated (Loibl 2016). Yet, the scope and frequency of this phenomenon are difficult to assess. Illegal adoption activities often remain invisible since they are embedded in a legitimate system. Illegally obtained children – often too young to conceive the illegal circumstances of their placements – are not traded in the underground but passed through the same legal channels as children that are legally declared free for intercountry adoption. As a result, illegal and legal adoptions become hopelessly mixed up in the adoption system. The children can therefore not easily be identified and construed as illegally obtained. An adoptee’s illegal origin may only be detected if the child was not laundered “properly,” meaning if the adoption documents include contradictory information on the child’s origin and background (see, e.g., Wacker 2000).

Criminogenic Asymmetries Between Demand and Source Countries

The high demand of and the illegal supply with adoptable children, as well as the reduced ability of legal guardians to control the intercountry adoption system, are caused by demographic and economic asymmetries between the sending and the receiving countries. Passas (1999: 402) argues that transnational crime is the product of “criminogenic asymmetries,” which he defines as “structural
discrepancies, mismatches and inequalities in the realm of economy, law, politics, and culture.” Such asymmetries are produced in the course of interactions between unequal actors and systems with distinctive features (Passas 2000). They cause crime in three ways:

1. by fuelling the demand for illegal goods and services;
2. by generating incentives for people and organizations to engage in illegal practices; and
3. by reducing the ability of authorities to control crime.

Dynamics of globalization, Passas (1999) claims, have further intensified the existing criminogenic asymmetries. Globalization has brought into closer contact, interaction and interdependence countries with unequal power and diverse cultures, legal traditions, and economic and political outlooks. It reinforces inequalities of power and wealth, both within nation states and among them, and intensifies global hierarchies of privilege, wealth, and control. As criminogenic asymmetries are multiplied by these dynamics, rates of criminal activities naturally increase, unless effective control systems are in place. However, Passas (1999: 410) argues that official controls get weakened by processes leading to dysnomie, which is constituted by “(1) the absence of a widely accepted transnational normative framework to regulate cross-border activities, and (2) the existence of many different, inconsistent and often conflicting legal frameworks.”

With regard to the intercountry adoption market, economic and demographic asymmetries between the sending and the receiving countries have fueled the demand for, as well as the illegal supply with, adoptable children. Whereas the rich Western countries are struggling with low birth rates and decreasing numbers of children available for domestic adoption, birth rates are increasing in the poor countries of the global South. These asymmetries were intensified by processes of globalization, which further increased the wealth in industrialized Western countries, leading to reduced birth rates, while aggravating poverty in other parts of the world, which is linked with population growth (Harrison 2007). The bifurcation between wealthy child-poor countries exerting the demand for adoptable healthy babies and poor child-rich countries that are the source of the highly valued children is evident in the statistics on intercountry adoption, which clearly refers to industrialized countries as receiving nations and developing countries as sending states (Selman 2017). An exception is the United States which is both the most significant recipient and an important provider of children (mostly of African descent) to same-sex couples in Europe, particularly in the United Kingdom as well as in the Netherlands (Marre and Briggs 2009).

The economic and demographic asymmetries between the sending and receiving states have fueled the demand for adoptable children and shaped the motivation of actors in the source countries to illegally obtain them. A large proportion of the population in attractive supplying states live in poverty. In societies with very low per capita incomes, country fees and other costs that may seem reasonable from a Western perspective are sufficient to create an incentive to illicitly source children and then launder them through the adoption system. As Smolin (2006: 175) stresses:
Money is the primary motivation in most cases of child laundering in the intercountry adoption system. The transfer of Western wealth into sending nations is the primary vulnerability of the intercountry adoption system. Western funds provide an incentive to engage in child laundering which attracts unscrupulous persons into the system while tempting even charitable child welfare institutions into unscrupulous conduct.

An example of the enormous sums of money that can be earned from an international adoption is Guatemala, a country that emerged as a significant supplier of children from 2003 to 2008 and which became almost synonymous for illegal adoption practices. Although Guatemala is a developing country where about 39% of the population lives below $2 a day (The World Bank 2013), the fees for international adoptions paid to Guatemalan attorneys handling international adoptions ranged between $18,000 and $19,000 (Smolin 2006). According to the report of the Special Rapporteur on the sale of children, child prostitution, and child pornography (Commission on Human Rights 2000: para. 36–38), the attorneys would “use middlemen to seek out pregnant women who, because of poverty or prostitution, might be willing to give up their children or to sell them” and who would “resort to threats or even baby-stealing.” If the mother cannot be persuaded.

Even charitable organizations may be financially motivated to generate and supply “adoptable” children. They may subvert the subsidiarity principle, laid down in the UNCRC and the Hague Convention, as more money can be made from international placements rather than domestic child care solutions. Or they may even place children whose families have not actually relinquished their parental rights. Orphanage directors may engage in these illegal practices out of the necessity to cover the institutions’ expenses or in order to profit financially (Hoelgaard 1998; Stuy 2014).

The criminogenic asymmetries have also reduced capable guardians in the adoption system. Basically, the Hague Convention sought to establish an effective control system with the aim of reducing incidences of illegal adoption practices. Yet, the treaty does not provide an overseeing international body that would ensure that intercountry adoptions would comply with its principles and standards. Rather, it leaves regulatory enforcement functions in the hands of national bodies. Yet, widespread corruption in the sending countries, which was both caused by and further increased existing asymmetries, has weakened official controls. Individuals and organizations, from both the public and private sector, that ought to monitor and control the adoption system misuse their function to connect demand and illegal supply, by laundering children through their organization.

Profit is not the only reason why actors become involved in illegally sourcing children and then laundering them through the adoption system. Also, the idea that children are better off growing up in a wealthy Western state than staying with their impoverished families in their poor native countries, that international adoption is in any case in the child’s best interests, may incite actors in the adoption system to engage in abusive adoption practices (Hoelgaard 1998). In countries where children and their families live in extreme poverty and face difficulties in affording shelter and food, let alone education, trafficking the children for the purposes of adoption may seem as a necessary evil toward a greater good.
Cycles of Abuse and Displacements Effects of Supply Reduction

Generally speaking, China and Russia have been quite persistent supply countries. Both emerged as sending states in the 1990s, and they have remained among the top suppliers of children ever since, even though the number of children sent abroad has been on a constant decrease for several years. This is not true for many other countries that quickly rise as significant providers for a couple of years only to shut down intercountry adoptions altogether or to limit them after serious incidents of illegal and abusive adoption practices. The decreasing significance or entire dropout of important sending countries leads to a displacement effect. As supply is restricted from one source country, another supplier emerges which would invite the unscrupulous into the adoption system. Illegal adoption practices would then continue in this new source country (Smolin 2006).

Graff (2014) investigated international adoption in Ethiopia and identified three stages this country underwent, which may also be observed in other “temporary” sending nations. In the first stage, only a relatively small number of intercountry adoptions took place in Ethiopia that were a “welcomed humanitarian venture for the desperately needy few.” By 2003, only three licensed adoption agencies were operating which sought to place those children that could not be cared for by (extended) families or friends in their native country. Soon, however, Ethiopia became a significant supplier in the adoption industry. The number of children sent abroad rose dramatically from 620 in 2000 to 4553 in 2009. Also, the number of licensed adoption agencies increased to 70 in 2008. Contributing to that explosive growth was the fact that Russia and China were sending far fewer children and that Guatemala was about to stop intercountry adoptions altogether.

Ethiopia, therefore, reached the second stage which Graff (2014) calls the “gold rush.” She explains, “there were too many agencies, too many children coming and going, too many people opportunistically looking in the countryside for ‘adoptable’ children.” The enormous growth has turned Ethiopia into a fertile ground for illegal adoption practices. The problem of middlemen, actively buying and selling children for intercountry adoption, became so big that the Ethiopian government was forced to take countermeasures. By 2011, Ethiopia finally reached the third stage: due to reports about illegal and abusive practices, the government decided to slow down intercountry adoption dramatically, and it decided to suspend intercountry adoptions in 2017.

The restriction of supply in adoptable healthy babies does not only lead to a geographical, but also a functional, displacement. More and more sending countries decide to limit the number of (young and healthy) children sent abroad by enforcing tighter adoption laws and procedures (this often happens in the course of ratifying the Hague Convention). This is why the adoption market is slowly drying out (Joyce 2013). However, since the demand for healthy babies continues to stay high, a shift is taking place from intercountry adoption to surrogacy agreements (Rotabi and Bromfield 2012). Compared to intercountry adoption, surrogacy is less visible, less regulated, and even more difficult to control, which makes it a particularly attractive alternative to adoption for involuntarily childless couples in Western countries.
Conclusion

The last half-century has witnessed the emergence of a transnational adoption market in illegally obtained children. The basic logic of routine activity theory offers a means of conceptualizing this market and identifying its structural components: demand, supply, and social control. Adopters and adoption agencies, especially in the United States, Europe, and Canada, constitute the demand component. In Western countries, the number of children available for adoption has decreased since the 1970s due to liberal abortion politics, contraception, and the increasing acceptance of unwed motherhood. Hence, the adoption of a child from a foreign country has become an attractive (and often last resort) alternative for many involuntary childless couples. Their demand for easily adoptable healthy babies exerts an inexorable pull on child-rich poor countries. The pressure on these countries does not only originate from the adoptive parents but also from adoption agencies, whose existence is dependent on the number of intercountry adoptions they place.

Whereas Western countries constitute the demanding states, child-rich countries of the Global South form the source countries for adoptable children. However, most children actually available for intercountry adoption in these states are already older and/or sick and are thus not the attractive adoptees Western couples are looking for. In order to meet the high Western demand for babies, actors in the sending countries employ a variety of illegal means to generate adoptable children. Children are being purchased or abducted from their families, hospitals, or orphanages. Vulnerable birth parents are coerced or provided with misleading information on the consequence of an adoption to obtain their consent. Directors of child care institutions and government officials are paid to subvert the subsidiarity principle that is laid down in the Hague Convention and the UNCRC in order to increase the supply of adoptable children. From a supply perspective, thus, the magnitude of the current illegal adoption market is the product of a large number of poor families, struggling to provide for their children, as well as orphanages, caring for many parentless children.

In order to sustain an illegal market in adoptable children, demand and illegal supply sources need to be securely linked. Connecting buyers and sellers with each other is necessary, which is organized differently than in conventional forms of human trafficking. Whereas the purpose of conventional forms of human trafficking is illegal (e.g., sexual exploitation, organ removal, slavery), adopting a child is perfectly legal at the demand end of the system. An adoption only becomes illegal when the child has been obtained illegally. Therefore, the illicit means by which children were obtained must be disguised: a laundering process is therefore crucial here. This process is facilitated by individuals and organizations from both the public and private sector that ought to serve as legal guardians in the adoption system but misuse their function to convert illegally obtained children into “orphans” and then “adoptees.” They would falsify or fabricate necessary documents in order to hide the illegal conduct, as well as to identify the illegally obtained children as legally abandoned orphans for which no domestic child care solution could be found.
The high demand for and the illegal supply of adoptable children, as well as the reduced ability of legal guardians to control the adoption system, are caused by demographic and economic asymmetries between the sending and the receiving countries. Whereas the rich Western countries are struggling with low birth rates and decreasing numbers of children available for domestic adoption, birth rates are increasing in the poor countries of the global South. These asymmetries shaped the motivation of actors in the source countries to illegally obtain adoptable children. The adoption costs that may seem reasonable from a Western perspective are sufficient to create an incentive for orphanage directors, government officials, and others to illicitly source adoptable children. The criminogenic asymmetries have also reduced capable guardians in the intercountry adoption system. Widespread corruption in the sending countries, which was both caused by and further increased these existing asymmetries, has weakened official controls. Individuals and organizations from both the public and private sector that ought to monitor and control the adoption system misuse their function so as to connect demand and illegal supply by laundering children through their organization.

Abstract

This chapter focuses on the situation affecting women and girls who are trafficked within the Boko Haram conflict. It navigates the entrenched cultural and traditional norms existing in the geographical area and how the conflict poses a double jeopardy for women and girls who are already marginalized. The added element of trafficking, as another author calls it, builds the arsenal of Boko Haram. This crisis within a crisis shows the nexus between trafficking, and the Boko Haram conflict and is categorized as the “not so good,” the “bad,” and the “outright ugly.” The abductions of the Chibok and the Dapchi girls are examples which are discussed, as well as the stigma that survivors undergo.

**Introduction**

From the fifteenth through to the nineteenth century, over 3.5 million African slaves were transported across the Atlantic to Europe, North and South America, and the Caribbean by the Europeans who had expanded and colonized those territories (Harvard Divinity School 2018). This is what is now known as the transatlantic slave trade. Slaves were provided by local rulers and traders, among others, and in exchange, they were given guns, gunpowder, rum, cloth, horses, etc. These slaves were used individually for domestic slavery or in larger groups. Domestic slaves worked mostly in shops and households, whereas larger numbers of slaves were employed to work on farms. The slave trade was abolished in the nineteenth century; however, it still continues in the form of human trafficking or modern-day slavery.

According to the United Nations definition, human trafficking is the acquisition of people through means of force, fraud, or deception, with the intention of exploitation (Wilken 2017).

The paper uses the United Nations Office on Drugs and Crime (UNODC) definition of trafficking (UNODC 2018).

Article 3, paragraph (a) of the Protocol to Prevent, Suppress and Punish Trafficking in Persons defines trafficking in persons as the recruitment, transportation, transfer, harboring, or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability, or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labor or services, slavery or practices similar to slavery, servitude, or the removal of organs.

The UN Protocol on Trafficking defines trafficking in humans as “all acts related to recruitment, transport, sale or purchase of individuals through force, fraud or other coercive means, for the purpose of exploitation” (Caritas Nigeria 2018). On the basis of the definition given in the Trafficking in Persons Protocol, it is evident that trafficking in persons has three constituent elements:

**The Act** (what is done)

- Recruitment, transportation, transfer, harboring, or receipt of persons

**The Means** (how it is done)

- Threat or use of force, coercion, abduction, fraud, deception, abuse of power or vulnerability, or giving payments or benefits to a person in control of the victim
The Purpose (why it is done)

For the purpose of exploitation, which includes exploiting the prostitution of others, sexual exploitation, forced labor, slavery or similar practices, and the removal of organs.

Individuals are trafficked locally, regionally, and internationally across land borders, across seas, and by air. Difficulty in defending Nigeria’s extended borders has allowed traffickers and pimps, as well as groups like Boko Haram, to exploit this weakness and cross borders unimpeded (Petal 2014). One thousand four hundred seventy-nine illegal borders exist in Nigeria, which shares about 773 km border with Benin Republic, about 87 km with Chad, and a stretch of 1,049 km with Niger Republic and 1,690 km with Cameroon (http://nationaldailyng.com/porosity-of-border-why-nigeria-must-tighten-border-security/).

Nigeria is regarded as a “source, transit, and destination country.” Nigeria is a source country because a number of the trafficked people come from different parts of the country. It is also a transit country, as this is where trafficked women and girls pass through and are eventually distributed to other countries. It is a destination country; in some cases, it is the end of the road for trafficked victims: “Trafficked Nigerian women and children are recruited from rural areas within the country’s borders — women and girls for involuntary domestic servitude and forced commercial sexual exploitation, and boys for forced labour in street vending, domestic servitude, mining, and begging” (Osimen et al. 2014). Women and children usually bear the brunt of trafficking and are exported externally and internally for purely economic reasons. Internal trafficking involves the movement of individuals from local regions to bigger cities, i.e., for prostitution and child labor (domestic work and hawking). The root causes of trafficking in Nigeria include widespread poverty, violent conflict, and the desire to migrate to study/work/live in a better environment. Human traffickers adopt various methods to lure individuals into captivity. These methods include drugging, kidnapping, coercing with the promise of a better future, and offers of better opportunities for education or jobs.

Some of the external trafficking routes are better known than others. Recently, 26 Nigerian girls and women were reportedly sexually abused and murdered while trying to cross the Mediterranean to Europe. Most of the dead victims are teenagers aged 14–18 (Toromade 2017). In the account of a journalist, Ben Tuab, in 2016 alone, 11,000 Nigerian women and girls were trafficked. The route of trafficked girls is from Benin in Edo State, northward to Niger and Libya and onto boats across the Mediterranean to end up in Italy (Taub 2017).

Boko Haram

In 2005, a group emerged calling itself Jama’atu Ahlis Sunnah Lida’awati Wal Jihad (JAS), translated as People Committed to the Propagation of the Prophet’s Teachings and Jihad.

Initially, their motive was to protest unemployment and Western influence of universities. It was headed by a young cleric Mohammed Yusuf who preached that
the leaders who benefitted from Western education in northeast of Nigeria were corrupt. In July 2009, Mohammed Yusuf died while in police custody in Maiduguri, and his deputy, Shekau, emerged as his successor. More recently, they have become more militant and criminal. (Barna 2014)

The group has since morphed and is currently split into at least two distinct groups: JAS headed by Abubakar Shekau and Wilayat al Islamiyya Gharb Afriqiyah (Islamic State West Africa or ISWA) headed by Abu Musab al-Barnawi in 2016 (Gender Assessment of Northeastern Nigeria conducted for Managing Conflict in North East Nigeria (MCN)). JAS is now popularly called Boko Haram meaning “books are forbidden or western education is forbidden.”

The attack on non-believers draws from the “al-Wala wal-Bara” doctrine, which is portrayed as a defensive policy. All Muslims must fight to defend themselves and retaliate against the Kuffar (non-believer), who always instigate war (http://acdemocracy.org/islam-and-the-other-the-al-wala-wal-barra-doctrine/).

Boko Haram has robbed the northeast of Nigeria of its security and stability. Ironically, one of the northeastern states and most affected by Boko Haram was previously known as the “Home of Peace.” Deep-rooted patriarchy, rates of child marriage, literacy among girls, and women in positions of power are far worse than in the rest of Nigeria (Nwaubani 2017).

The Boko Haram sect has caused societal damage by negatively affecting millions of people by “daily killings, bombings, abductions, looting and burning,” and “schools, churches, mosques and other public buildings have been attacked and destroyed” (Amnesty International Nigeria 2015). The conflict has left in its wake fatalities, widows, acute food insecurity, widespread forced displacements, and insecurity.

According to the EU parliament, over 20,000 people have been killed and more than two million displaced, including from neighboring countries, since Boko Haram began its attack; and the UN Office for the Coordination of Humanitarian Affairs (OCHA) reported in November 2017 that in Northeastern Nigeria, 8.5 million people were in need of lifesaving assistance and that 6.9 million people were targeted for humanitarian assistance in 2017, whereas the International Criminal Court (ICC) has stated that there are reasonable grounds to believe that crimes against humanity under Article 7 of the Rome Statute have been committed in Nigeria by Boko Haram, including murder and persecution (European Parliament resolution on Nigeria (2018/2513(RSP))The European Parliament).

The conflict has largely been driven by a failure of governance as well as non-adherence to existing laws and policies. The lethal cocktail of violent conflict has a mixture of unaddressed root causes, exclusion, and poverty and conflict entrepreneurs. Conflict entrepreneurs are those who benefit in one way or the other from the conflict.

---

**Boko Haram and Trafficking**

The Boko Haram conflict has affected communities in Northeastern Nigeria Chad, Cameroon, and Niger. Millions of people have suffered “daily killings, bombings, abductions, looting and burning,” and “schools, churches, mosques and other public buildings have been attacked and destroyed” (Amnesty International Nigeria 2015).
In the context of violent conflict, such as Boko Haram, human trafficking has become the preferred trade of terrorists as it viewed as more profitable economically than any other trade. “Human trafficking is an extremely profitable industry that not only generates financial revenue, but also provides fighting power, helps terrorists vanquish the enemy, and destroys communities” (Wilken 2017).

The type of trafficking that occurred in the Boko Haram conflict fits the three constituent elements of trafficking: (1) The Act with the harboring or receipt of persons; (Wilken 2017) The Means with abductions; and (UNODC 2018) The Purpose with sexual exploitation, forced labor, or slavery or similar practices.

The trafficking routes can however not be categorized into distinct geographies such as a country of origin, transit, or destination for victims. In the context of conflict, these are blurred into one another. What is more obvious is the trafficking style and the destination.

The Boko Haram prototype of trafficking is the spectrum of women and girls most times forcibly married in a hybrid type of marriage or coerced, forced, or pressured because the sect used marriage as a simple way of recruiting women as wives, sex slaves, and even suicide bombers.

The unconventional war of Boko Haram, “the bad,” brought a new dimension of trafficking where the trafficked were forcefully married or abducted and married to Boko Haram terrorists.

According to a human watch report, Nigeria is seen as a source, transit, and destination country for human trafficking (Abubakar 2016). This as a result of the Boko Haram insurgency intertwined with the poverty and the violent state of the nation. Trafficking of women and girls has risen since the introduction of the Boko Haram sect.

The recurrent Boko Haram attacks have led to a mass exodus of people across the country and to neighboring countries with a number of internally displaced person (IDP) camps springing up. Women and girls are obviously the most vulnerable and in some cases undergoing several layers of trauma. The first layer is the disruption of their lives which may already be one of marginalization and exclusion which exists in times of relative peace. The endemic inequalities include early marriage and lack of access to education and land. The next layer as a consequence of conflict includes abduction, sexual exploitation, and child widowhood.

The phenomenon of the “layered widow” is depicted in the personal testimony below with a child widow losing first her militant husband and later her peacetime husband.

Maryam Ali, now 17, was 14 years old and 5-month pregnant when she was abducted from Bama in Borno State and taken to the Sambisa Forest and married out to a Boko Haram militant.

“I am from Mayanti a village near Bama. When I got married about a year before my abduction, my husband took me to Bama where we were staying. During the attack on Bama, my husband escaped to Maiduguri because the militants were looking for men to kill. When they came to our house and met me alone, they took me away. Shortly after, I delivered my first child, I took in again for my militant husband,” she narrated.

“When my husband saw me with a child and another pregnancy, he fell down and died.” (Lillie 2014)
The plight of internally displaced girls is a continuum of the plight of the girl in the community with an additional layer of marginalization and vulnerability brought about by the situation of violent conflict, displacement, and survival of the fittest.

The rise of Boko Haram has also led to an increase in gender-based violence (GBV) where women are either used as agents of terror or targets of terror. With the number of attacks growing, links have been drawn with the role of human trafficking and the operations of terrorist groups. “Human trafficking now serves three main purposes for terrorist groups: generating revenue, providing fighting power; and vanquishing the enemy. This is as trafficking intimidates populations and reduces resistance just as enslavement and rape of women were used as tools of war in the past” (Shelley 2018).

With IDPs lacking the basic amenities and poor camp conditions, they also become prey to human sex traffic workers who often paint a false picture of a better life abroad. In some cases, it is those who are meant to offer protection to the displaced, i.e., the military and police, that are often involved in the sexual exploitation of women and girls where sex is offered in exchange for food.

International human rights organizations have reported SGBV incidents. A Human Rights Watch report stated that Nigerian officials have raped at least 43 women and girls in the IDP camps (Reporters 2016). In a very recent report by Amnesty International released in May 2018, titled “‘They betrayed us’: Women who survived Boko Haram raped, starved and detained in Nigeria,” the Civilian Joint Task Force (CJTF) were alleged to have assisted in finding women for sex, for soldiers in the Bama Secondary School IDP camp. They were pressured or coerced in order to access food and other essentials. Young girls were systematically separated from their families and raped (https://www.amnesty.org/download/Documents/AFR4484152018ENGLISH.PDF).

In an account by a 30-year-old woman from Bama, Maiduguri:

“A few weeks after soldiers transported us to the camp, near Maiduguri, one of the soldiers guarding us approached me for marriage. He used to bring food and clothes for me and my remaining four children, so I allowed him to have sex with me. He is a Hausa man from Gwoza. That is all I know about him. Two months later he just stopped coming. Then I realized I was pregnant. I feel so angry with him for deceiving me. When he was pretending to woo me he used to provide for me, but as soon as I agreed and we began having sex, his gifts began to reduce until he abandoned me. Now my situation is worse as the pregnancy makes me sick, and I have no one to help me care for my children.” (Human rights watch 2016)

The abductors’ enclave and destination of abducted women and girls were mostly in a wild conservation area called the Sambisa Forest. According to the report of the visit by the Bring Back Our Girls (BBOG) movement following a guided tour of the war zone with the Nigeria Air Force, the Sambisa general area is 60,000 Km² (Bring back our girls 2017) (Fig. 1).
Chibok Girls’ Abductions

“At least 2,000 women and girls have been abducted by Boko Haram since the start of 2014” (Amnesty International 2015). It is important to note that, before these major kidnapping events, news reports highlighted a number of rape and kidnap cases. “They
(the militants) were doing it (raping her) almost on a daily basis,” the young girl, whose secondary school education was forced to end in her fourth year as a result of the kidnapping, said. “When one militant gets tired, another takes over (Obaji 2017).”

 Trafficking associated with the Boko Haram conflict targeted especially young girls in schools. Not only did this traumatize them, but worse still, it discouraged the young girls and parents from sending their children and wards to school, especially boarding school. In Northern Nigeria where female enrollment in schools has been the lowest in the country, this constitutes the “not so good.”

 The trend of mass abductions was brought to the fore on the international scene with the abduction on April 2014 of 276 girls from Government Girls Secondary School, Chibok, in Borno State.

 The international outcry and outrage was made visible through the hashtag #bringbackourgirls. The Bring Back Our Girls movement organized daily sit-outs at the Unity Fountain in Abuja, the capital of Nigeria. International public figures like Malala made a special visit to Nigeria to advocate for their release.

 The good news is that some of the girls have returned or have been released. The first 57 escaped, followed by 3 who returned on their own and 21 whose release was negotiated in October 2016 and then another batch of 83 in May 2017. In January 2018, another Chibok girl was rescued. To date, it is presumed that 112 are still in captivity (Wikipedia.org).

 The girls said they started documenting their ordeal a few months after the abduction when the terror group gave them exercise books to use during Koranic lessons. To hide the diaries from their captors, the girls would bury the notebooks in the ground or carry them in their underwear. The diaries were said to have been written by Adamu and her friend, Sarah Samuel – the authenticity of the book cannot be verified. According to one account, “They (the militants) were doing it (raping her) almost on a daily basis”; the young girl, whose secondary school education was forced to end in her fourth year as a result of the kidnapping, said “When one militant gets tired, another takes over (Obaji 2017).”

 According to them, life in Sambisa involved regular beatings, Koranic lessons, domestic labor, and pressure to marry and convert. On another occasion, the militants gathered those girls who had refused to embrace Islam, brought out jerry cans purportedly filled with petrol, and threatened to burn them alive (Akinloye 2017).

 One report also stated that the released girls said 61 of the 142 girls had married Boko Haram militants and 8 died during air strikes, 3 during childbirth, and 1 of an unknown cause.

 The 21 Chibok girls recently released by Boko Haram terrorists have said they were not raped or abused during their stay in captivity, according to a source (Omojuwa 2016).

---

**Dapchi Girls’ Abduction**

In the course of writing this chapter, a similar abduction to that of Chibok was reenacted.
On February 19, 2018, 110 schoolgirls aged 11–19 years were kidnapped from Government Girls Science and Technical College (GGSTC), Dapchi, located in Bursari Local Government Area of Yobe State, in the northeast part of Nigeria. (The number was later confirmed as 113 by the Ministry of Information, Lai Mohammed.) Gunmen who were dressed in military fatigues and turbans arrived in Dapchi unchallenged and started firing indiscriminately shouting “Allahu Akbar” (“God is greatest”). The insurgents had attacked Government Girls Secondary School (GSS) Damaturu, GSS Mamudo, Federal Government College Buni Yadi, College of Agriculture Gujba, and GSTC Potiskum leaving scores of students dead and injured in the past (Marama 2018). One of the accounts of a school girl from Dapchi, Yobe State, Rakiya Adamu, SS2, who was among the lucky few who escaped on February 19, when dozens of her friends and school-mates were kidnapped, said, “I will not go back to Dapchi again (Premium times 2018).”

Their return was even more sinister because it was fraught with controversy. Tomi Oladipo, the BBC African security correspondent in his analysis, said: “Boko Haram definitely got something in return for waltzing back into Dapchi and dropping off the girls.” The manner of their return raised issues around the Boko Haram their manner of kidnappings and negotiations and the feeding of the pattern that has the potential to perpetuate such occurrences.

The Stigma Associated with Trafficking

The stigma associated with survivors of trafficking occurs at different levels. Girls returning from periods of abduction and forced marriage are stigmatized as wives of Boko Haram.

Boko Haram has forcefully married several of their abductors, some of them as young as 12 years old. These Boko Haram wives suffer additional layers of torture when their “husbands” are killed. The child widows when rescued are stigmatized as Boko Haram widows. These children carrying children are further stigmatized because their newborn babies are seen as having “bad blood” (Toogood 2016).

“Bad blood” means that these children are perceived to be tainted with the blood of Boko Haram and stand a chance of being ostracized, given fewer opportunities, and abandoned to a life on the streets. Women and girls are stigmatized or not trusted by fellow IDPs, security personnel, and their families.

With more women likely to be freed from Boko Haram or widowed as Nigeria’s military strives to defeat the militants, experts say insults, rejection, and even violence toward them as they return to their communities could hinder efforts to repair the social fabric of a region splintered by Boko Haram. For some, the fear of losing the status they acquired by being with their abductors is real. “Only when you get married to a rich man or a man of authority, can you get that kind of power” (Nwaubani 2017).
Trafficking and Interrupted Access to Education

The Boko Haram conflict presented the Nigerian state with an unconventional war-like no other, with the ideology of Western education being forbidden. The education environment that was hitherto seen as a safe space especially for the girl child was breached by targeted attacks on schools. This was compounded by the fact that Northern Nigeria already had issues around poverty, inequality, and poor development indices including low girl child education. Education is traditionally seen as the greatest form of empowerment of an individual, and this has been eroded by the presence of a conflict that attacked the very foundations of the educational system.

In one account, a young lady whose education was interrupted said, “I had completed my secondary education waiting to get admission into a tertiary institution. They brought out N2, 000 (The equivalent of approximately 6 dollars) and gave to my father as my bride price and dragged me into their vehicle and zoomed off. I was in the forest with them moving from one camp to the other until I took in for my so-called husband, Bakura, from Alagarno. Bakura left me in one of the camps and went for an attack when I was pregnant for 8 months but he was killed in the attack.” (Abubakar 2016)

During 2016, the UN documented nearly 500 attacks on schools or related education personnel in 18 of the 20 conflict countries (Human rights watch 2017).

Currently, in the northeast of Nigeria, all boarding schools closed. This has affected school attendance especially for those living at a distance from the schools and where protection on the way to school is lacking.

In the wake of the Dapchi school abductions, the Emergency Coordination Centre advocated for and achieved the signing of Nigeria of the Safe Schools Declaration on March 8, 2018 (Emergency coordination center. Women, Peace and Security-Gender Based Violence Fact Sheet).

Even after a conflict ends, it can take years to rebuild destroyed facilities and get the education system back on its feet – during which time whole cohorts of children are denied an education (O’Malley 2018).

Female Suicide Bombers

According to Elizabeth Pearson, writing in the International Business Times in an October 16, 2014, article, the first attack by a female was carried out on the military barracks in Gombe in July 2014. According to Guilbert, female members of Boko Haram are almost as likely as men to be deployed as fighters in northeast Nigeria (Guilbert 2016).

Women are not usually considered a threat, and the recruitment of females would throw the government of their scent as they were used to an all-male terrorist group. Female followers and forced conscripts can circulate in government-controlled areas more easily, as spies, messengers, recruiters, and smugglers (International crisis 2016). The attacks by females have typically been against “soft targets,” such as markets, mosques, and bus depots, and have taken place in urban settings. Boko
Haram, like other terrorist groups, has used women because they draw less attention and are less likely to be subjected to searches than men (Bloom 2016).

The spike in the use of suicide bombings constitutes the “outright ugly.” The attacks on soft targets rather than direct assaults using conventional weapons could also be evidence of the group’s dwindling resources, as reports of fighters riding horses rather than traveling in vehicles and utilizing weapons such as crude knives and machetes instead of guns seem to attest. According to one interview with a Nigerian soldier, the use of suicide bombers is a cheap and terrifying way to wage a war and also has the effect of sowing seeds of suspicion and fear among and between citizens, a tactic that furthers the group’s aim to unspool the thread of society. To be certain, in reports received from the field through the NSRP Observatory Platform as well as the P4P Map, over the course of late 2014 to the end of 2015, targets increasingly included mosques, churches, schools, petrol stations, markets, and, as noted in the beginning, IDP camps. (Confronting the Unthinkable: Suicide Bombers in Nigeria. The Complex Dimensions Behind Women and Children Suicide Bombers in Northern Nigeria, Fund for Peace, Patricia Taft and Kendall Lawrence.)

UNICEF states that between January and August 2017, 83 children were used as “human bombs,” 55 were girls, most often under 15 years old, 27 were boys, and 1 was a baby strapped to a girl. (Emergency coordination center. Women, Peace and Security-Gender Based Violence Fact Sheet) In 2005, the Security Council established a Monitoring and Reporting Mechanism (MRM) to systematically monitor, document, and report on violations committed against children in situations of concern around the world (https://childrenandarmedconflict.un.org/six-grave-violations/).

“They gave us N200 each which they said we should use to buy food for ourselves. It took us three days to come to Maiduguri on a motorcycle. We were directed by the sect members to detonate our explosives anywhere we saw any form of gathering (Dachen 2017).”

The Nigerian army revealed that some parents donate their daughters to the Boko Haram for suicide attacks. The Army in a statement by its spokesperson, Sani Usman, therefore warned such parents to desist forthwith. Mr. Usman said the appeal became necessary following revelations by some intercepted female suicide bombers during interrogations.

It was discovered that most of these hapless minors were ‘donated’ to the terrorist sect by their heartless and misguided parents and guardians, as part of their contribution to the perpetuation of the Boko Haram terrorists’ dastardly acts against the Nigerian society and humanity. (Ibrahim 2017)

Importance of the Women Peace and Security Agenda in the Prevention of Trafficking

Nigeria is currently on her second-generation National Action Plan (NAP) on Women, Peace and Security (WPS) (2017–2020). The essence of a National Action Plan is to (Harvard Divinity School 2018) help implementers set priorities,
coordinate action, and track progress; (Wilken 2017) prompt meaningful changes in behavior, policies, and funding; (UNODC 2018) create space for governments, multilateral institutions, and civil society to work together for greater impact; and (Caritas Nigeria 2018) provide civil society with a mechanism to hold governments accountable. (A review of Nigeria’s 1st National Action Plan on Women, Peace and Security (2013–2016). Anna Parke, Amy Harrison, Eleanor Nwadinobi and Uchenna Nwokedi August 2017).

Other reinforcing resolutions and conventions provide the opportunity to strengthen the WPS agenda:

UN Security Council, Resolution 2242, adopted October 2015, calls for “the greater integration by Member States and the United Nations of their agendas on women, peace and security, counter-terrorism and countering-violent extremism which can be conducive to terrorism.”

UN Security Council Resolution 2349, adopted by the Security Council on March 31, 2017,

Section 7 calls upon the countries of the region to prevent, criminalize, investigate, prosecute, and ensure accountability of those who engage in transnational organized crime, in particular in arms trafficking and trafficking in persons.

_in the words of the_ permanent representative of the UK to the UN, Amb. Matthew Rycroft, at the Security Council briefing on “Peace and Security in Africa” with the focus on Nigeria and the Democratic Republic of the Congo:

It’s unacceptable that women continue to be so poorly represented in formal governance and peace processes when time after time studies show that women’s participation in these processes aids their ultimate success. (George 2017)

---

**Role of the Media and Trafficking**

Media accounts of the happenings attempt to give us a true picture of the situation. It is the media that played a key role in the #bringbackourgirls campaign. The print media kept a daily count of the number of days that had passed since the Chibok girls had been abducted. Each day the number was updated in the print and electronic media.

Unlike regular bombings and shootings, tactics long used by the group, human trafficking poses a new kind of threat: everyone is a target for slavery and anyone can be morphed into a tool for Boko Haram to use in its efforts (Wilken 2017).

Conflict-sensitive reportage ensures that the narrative does not further drive the conflict. It was important for the media to provide information in a way that maintained the dignity of the victims and to avoid reprisal attacks. The narrative had to be sensitive to around labeling or stigmatizing of abductees of Boko Haram.
These survivors now face intense stigma and in some cases brutal beatings, when they return to their communities, according to humanitarian groups. Some women who have escaped report psychological trauma and rejection by their communities despite the best efforts of religious leaders. Particularly for those who have been forcibly impregnated, reintegration is practically impossible (Bloom 2016).

Media also has a role to play in investigative journalism. With the Chibok and Dapchi incidents, there were conflicting reports followed by discrepancies in the numbers. The media at that time gave conflicting reports.

In a video, the leader of the Boko Haram, Abubakar Shekau, claimed responsibility for the abduction of over 200 Chibok school girls in Northeastern Nigeria and threatens “I will sell them off.” (Guardian 2014) This threat drew more attention to the reality of human trafficking and introduced an aspect of Boko Haram that had not previously been considered.

In a recent study, respondents agreed that the media enlightenment was useful in informing people about the dangers of associating with JAS and dissuading them from joining the sect. (Perceptions and experiences of children associated with armed groups in Northeastern Nigeria 2017 NSRP/UNICEF.)

The media is also what the terrorists feed on, as evidenced by the timing of their communications to coincide with countering the announcements by government. The announcements of containment by government are soon followed by an attack to inflict fear on the population or to refute the government narrative.

---

**Role of Female Hunters**

In the case of Boko Haram and the trafficking of women and girls, the narrative usually focuses on their vulnerability and the ease with which they can be abducted. Little is said of the resilience of women and girls and their role in peacebuilding or as active participants in fighting off Boko Haram.

Female hunters are a part of security response to Boko Haram that includes the yan gora (Civilian Joint Task Force – CJTF), yan bang (vigilantes), and kungiyar maharba (hunters). A recent study is looking at the perception that the civilian population are largely unanimous in their thinking that CJFT were courageous in standing up to the armed gang and largely responsible for the decimation of Boko Haram.

The CJTF members have however assumed a new status in the community of respect on the one side; some have taken it to the extreme and have become extortionate at checkpoints, violence against women, and indulging in drugs.

The concern is what will happen now that the conflict has died down since they are armed and are therefore more easily be used by politicians in the upcoming elections.

The account of Bakari Gombi a hunter is fascinating. Bakari Gombi is one of only a handful of women involved, and she has become a heroine for hunters and local people alike. Her gallantry has won her the title “queen hunter.”

Like many in the rural regions of northeast Nigeria, Bakari Gombi is a Muslim but also believes in traditional spirits. One of her rituals is to douse fellow hunters with a secret potion to protect them from bullets. The 38-year-old leads a command of men aged 15–30 who communicate using sign language, animal sounds, and even birdsong.

“Boko Haram know me and fear me,” says Bakari Gombi whose band of hunters has rescued hundreds of men, women, and children (http://www.thebusinesdispatch.com/meet-aisha-former-antelope-hunter-now-tracks-boko-haram/).

---

**National Response to Trafficking**

In an effort to curb the trafficking more broadly, the Nigerian Government has put in place an agency to address trafficking. Nongovernment organizations have also made an effort.

The Violence Against Persons Prohibition Act 2015 otherwise known as VAPP Act.

A bill for an act to eliminate violence in private and public life; prohibit all forms of violence sexual, psychological, domestic, and harmful traditional practices and discrimination against persons; and to provide maximum protection and effective remedies for victims and punishment of offenders, 2015 (hb. 191).

The bill which among other things has varying punishment for rape (s1), female genital mutilation (S6), harmful widowhood practices (S15), violence by state actors (S 24).

Section 10 depriving a person of their liberty, Section 12 forced financial dependence, and Section 13 forced separation from family and friends, all resonates with trafficking.

Part IV Section 44 of the VAPP act puts the onus for policing the act on the NAPTIP. “Part IV Regulatory body, Section 44, “The National Agency for the Prohibition of Trafficking in Persons and Other related matters (NAPTIP)” is mandated to administer the provisions of the act and collaborate with relevant stakeholders including faith-based organisations.”

The anti-human trafficking women and children unit is a unit of Force Criminal Intelligence and Investigation Department (FCIID) of the Nigeria Police Force. It came into existence in 1994 following an upsurge in cases of trafficking in human beings. There are officers across all police formations and divisions currently headed by a Deputy Commissioner of Police. The key role of the anti-human trafficking unit is investigation and prosecution of cases of human trafficking, gender-based violence against women/children, and other related offenses. In addition, they are engaged in interception at airports and land boarders of deportees and victims of human trafficking.
There have been efforts by civil society; these efforts are mostly targeted at the trafficking route which commences in Edo State of Nigeria, “routinely cited as the main area in Nigeria from where young women are trafficked,” efforts such as those of Titi Atiku-Abubakar, wife of the former vice-president of Nigeria. In 1999, she stood on her husband’s ascendency to the office of vice-president to establish the Women Trafficking and Child Labour Eradication Foundation (WOTCLEF) (http://www.antitraffickingreview.org/index.php/atrjournal/article/view/64/62). In addition, there is the initiative of the wife of the Edo State Governor, Eki Igbinedion, the Idia Renaissance project which brought traffickers to book and was able to repatriate some of the girls. Surprisingly, parents were unhappy that their children were repatriated because things were difficult at home (https://www.vanguardngr.com/2017/05/horror-human-trafficking-edo/). More recently, a nongovernmental organization, Media Campaign Against Human Trafficking (MECHAT), launched a film called Desperate Journeys on anti-trafficking in February 2018.

Conclusion

In conclusion, the cultural vulnerabilities of women and girls which exist in relative peacetime have been made worse by the Boko Haram conflict. The development of a stabilization and recovery strategy that aims to create an enabling and safe environment and increase access to quality education will contribute to restoring confidence for trafficked girls to go back to school, thereby addressing this “not so good” phenomenon.

The presence of good governance, human rights, and dignity alongside addressing structural inequalities and marginalization of groups is the recipe for restoration of lasting peace. In the post-conflict phase, this will require sustained and coordinated peace building efforts, reconciliation, and the consolidation of resilience, thus addressing the “bad,” the unconventional warfare of Boko Haram.

The emergence of women and girls, especially the young girls among them as female suicide bombers, is considered to be the “outright ugly.” The different theories are yet to be fully understood. These include the fact that they may have been coerced, used as human bombs, or made to believe that they are practicing the doctrine of “al-Wala wal-Bara” and targeting those they perceive to be unbelievers. Whichever it is, this trend can be addressed through effective implementation of legislation, policies, strategies, and practices which will need to be adopted to counter and prevent violent extremism.

Recommendations

1. High political will is needed to prevent and respond to trafficking in the context of the Boko Haram conflict.
“It means governments holding to account those who have committed these crimes; showing that there can be really no impunity and no escape; that the rule of law applies to everyone (George 2017).”

This will include appropriate compensation and restitution, measures to counter the financing of terrorism, and keeping dialogue options open with abductors.

2. Community engagement with traditional institutions and leaders. This will require the use of traditional media, social media, community radio, community announcers, songs, poems, art, and traditional folklore and drama.

3. Domestication and implementation of related Security Council resolutions. Full implementation and funding of the NAP on WPS will address issues of trafficking which appear as a priority activity in all the geopolitical zones of Nigeria.

UNSCR 1325 on Women Peace and Security – survivors of trafficking in conflict should be part of prevention of conflict, mediation, and post-conflict reconstruction.

However, this involves not only providing financial and coordinating oversight but is part of a much bigger project of political buy-in and strategic prioritization.

Civil society actors also have a key role to play in supporting NAP WPS implementation.

Schools should provide the incentive for enrollment, retention, and completion.

Security Council members should endorse the Safe Schools Declaration, an intergovernmental political commitment, to protect education in armed conflict and to avoid the use of schools for military purposes, Human Rights Watch said (Human rights watch 2017).

Young girls in a safe space feel safe to play games and can build their voices to make demands on society.

Life skills clubs for girls provide an opportunity to engage girls in productive past time provision of second chance options for dropouts.

5. Services for returnees of trafficking.
Services should be holistic providing opportunities for girls involvement in humanitarian aid.

Women and girls also have a key role to play in the rebuilding of a war ravage areas.

Abstract

This chapter will draw on recent research in Victoria, Australia, to examine the limits of legal responses to both human trafficking and family violence. It will map some of the critical issues that arise when exploitation, including debt bondage, forced labor, sexual violence, and interpersonal abuse, occur within the context of a relationship between an Australian citizen or permanent resident (most often a man) and a noncitizen who has a temporary visa (most often a woman). The aim of the chapter is to highlight the limits of both trafficking legislation and family violence legislation to adequately capture and effectively respond to violence and exploitation in this setting. Drawing on case studies, the chapter will map key concerns that are challenging how we think about the utility of the current counter trafficking regime.

Introduction

Since the first iteration of the contemporary international response to human trafficking, in the form of the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime [hereinafter Trafficking Protocol], there has been a tendency for the focus and scope of counter-trafficking efforts to expand and shift, reflecting shifting tides of focus, attention, and interest. The emphasis on the links between violence against women and human trafficking, too, have waxed and waned. The early focus on sex trafficking, almost exclusively, was focused on gendered sexual violence, but this is no longer the sole focus and indeed is no longer the predominant focus of counter-trafficking efforts, particularly in western nations (O’Connell-Davidson 2014; Segrave et al. 2018). It has been exploitation in the context of labor beyond the sex industry – in the farming, sourcing, and production of goods; in global supply chains; and in service and care industries – that has garnered increasing international attention. More recently, forced marriage, at times referred to as a servile marriage, has come to international attention within the context of human trafficking, and under the expansionist terminology of modern slavery (see Vidal 2017). While this is viewed as a gendered form of coercion and violence, it is largely not linked to the focus on a predominant global form of gendered violence: intimate partner or family violence.

The aim of this chapter is to draw on an extensive study of temporary migration and family violence conducted in Victoria, Australia, to explore the interconnections between family violence and trafficking or slavery-related offences in Australia (Segrave 2017). The study focused on the intersection of precarious migration status and family violence (a broader terminology that captures intimate partner and interfamilial violence). The research was informed by recent inquiries and reports that recognized the need for detailed research on the specific experiences of women from immigrant and refugee communities, particularly those whose migration status is temporary, in order to better understand the specific structural and familial circumstances that impact their experience of family violence and the supports available to them. Broadly, it focused on the specificity of migrant women’s experience of family violence (such as the prevalence of multiple perpetrators), the use of migration status as leverage for violence, the threat of ostracism from the community, and threats of harm to women and their families (in Australia and in their country of origin) as retaliation for leaving an abusive partner. Relevant here, though, is the specific focus in this study which was the effort to document the breadth of situations of violence and exploitation, and the extent to which some cases may better be considered cases of human trafficking and/or slavery-like offences as defined in the Commonwealth Criminal Code s270 and s271. The
complex ways that family violence overlaps and intersects with trafficking and slavery is explored in this chapter. This chapter seeks to lay the ground for informed, and careful conversations regarding the limits of legal responses, the importance of attending to structural factors the contribute to conditions within which exploitation and abuse occur, and the importance of prioritizing the safety and well-being of victim survivors in the context of the response to all forms of exploitation, particularly gendered violence. It begins first with an overview of the policy and legal context.

The Australian Legal and Policy Background: Migration Law, Trafficking, and Slavery Offences

The overlap between family violence and human trafficking is not well understood internationally, and this is also true in Australia. Both issues tend to be attended to separately in law and policy, but also in terms of how they understood. Where family violence is interpersonal, familial, and domestic, human trafficking and slavery-like offences are linked to organized and transnational crime. In relation to both issues, Australia has a national response. The two responses are, however, largely siloed.

Australia has been committed to addressing human trafficking since 2003 when it first introduced a Commonwealth policy response to focus, at that time, on sex trafficking specifically (see Segrave 2004). Since that time, the focus and the policy and legal response has expanded (Segrave 2017). Human trafficking and slavery offences are criminalized in the Commonwealth Criminal Code Act 1995 (Criminal Code) Divisions 270 and 271, where Division 270 specifies slavery, slavery-like practices (including servitude, forced labor, and deceptive recruiting for labor or services), and forced marriage. Division 271 relates to trafficking in persons and includes domestic trafficking, organ trafficking, trafficking in children, and debt bondage and harboring offences. To date, there has been no specific effort to focus on these offences within the context of partner migration and intimate partner relationships. While forced marriage has recently received considerable attention, it is largely a preemptive effort to support young women (predominantly) whose families have informed them they will be sent overseas to be married and who are seeking the assistance of authorities to prevent this from happening (see Segrave 2017; Vidal 2017 for some discussion of this).

While family violence and violence against women more broadly have long been issues addressed by the Commonwealth and State and territory governments in Australia in a piecemeal way, in recent years, this has come to the fore of political priorities. This is evidenced in multiple public statements from our Prime Ministers, and formally embedded in the 2011 National Plan to Reduce Violence against Women and their Children 2010–2022, which was endorsed by the Australian Commonwealth government together with the state and territory governments. Further, it has been the state of Victoria, which has effectively led the nation towards
an innovative and comprehensive response to family violence. In 2014, the Victorian Government announced a Royal Commission into Family Violence [VRCFV] was launched in 2015, and it released its final report and recommendations in 2016. The Victorian government committed to ensuring that each of the 246 recommendations of the VRCFV be implemented, and it has committed millions of dollars to creating infrastructure, funding research, and putting in place legal and structural reform towards achieving the agenda outlined by the VRCFV.

Within this national and state context of increased awareness and attention of the breadth and depth of family violence across Australia and its impact, there has been growing recognition of the importance of attending to the specificity of experience and the need for targeted support for a range of groups in our community such as LGBTQI, those with physical or intellectual disabilities or impairments and immigrant and refugee women. The contribution of the migration system to creating or sustaining immigrant and refugee women’s vulnerability has been recognized since the 1980s in Australia. In particular, there was a concern in relation to Australian citizens or permanent residents being repeat (or “serial”) sponsors for partner or marriage visas, and research revealed that many of those who were identified as serial sponsors were also often domestic violence offenders (Iredale 1994). Changes were made to sponsorship to limit this occurring, and in 1994, holders of a temporary partner visa who were on a pathway to access permanent residency were able to access what is now called the Family Violence Provision. This provision in the Migration Act sought to provide a safety net to women who had experienced family violence from their Australian citizen or permanent resident sponsor, and whose relationship had dissolved as a result of that violence, so they could still access permanent residency. It is, however, a limited safety net and the research that informs this chapter suggests that it is not well accessed (see Segrave 2017).

More recently, in the wake of the national and Victorian agenda for reform in the area of family violence policy and law, there has been a growing interest in immigrant and refugee women. In this context, emerging research has identified the need to build an evidence base to inform understanding of migration-specific risk which is understood to be at once significant, and poorly understood (McCulloch et al. 2016; Vaughan et al. 2016; VMC 2016; Commonwealth of Australia [DSS] 2011). This lay the ground for the research that is the foundation for this chapter. However, largely unaddressed both in the area of family and intimate partner violence research and policy development and in the field of human trafficking research is the interconnections between trafficking, slavery, and family violence. While there are some exceptions, particularly Quinn’s (2009) work on “exploitative domestic and sexual servitude” in relationships involving Australian sponsors and temporary noncitizens (see also Lyneham and Richards 2014), there is a limited understanding of the complex and nuanced ways in which these forms of exploitation and abuse may be experienced by women. This chapter draws on case studies from this study to raise some specific challenges to where and how we understand,
identify, and respond to exploitation and abuse as trafficking in persons. First, however, a brief outline of the study is offered.

**The Study: Methodology**

This study was a partnership with a specialized multicultural family violence service provider [The FV Centre] in Victoria, Australia, and the researcher. The study involved accessing 300 closed client case files from the FV Centre from 2015 to 2016 files, which involved clients whose migration status was temporary when they first came into contact with the FV Centre. These clients included those on partner-related visas, but also those on working, student, visitor, and other temporary visas. The research was conducted with the approval of the Monash University Ethics in Human Research Committee (CF16/2277 – 2,016,001,127) which took into account the highly sensitive nature of the case files, and the inability of the researchers and the agency to contact former clients to approve the use of these files for research purposes. The files were all maintained on the premises of InTouch, and a database was created to enter de-identified information into on site, to ensure that the physical files did not leave the premises.

The database enabled quantitative and qualitative data to be gathered, including the identification of indicators related to other Commonwealth offences, specifically forced labor, forced marriage, human trafficking, and slavery (as per ss. 270 and 271 of the Commonwealth Crimes Act and as per the International Labour Organization international indicators for sexual and labor-related exploitation, ILO 2012). However, it must be noted that the data was inherently inconsistent and limited: case files are not kept for the purpose of research; rather they reflect the specific parameters and needs of the client within the context of family violence service provision. As this is a specialist service provider where a migration agent works alongside case workers, when necessary, the case files included the collective records of case workers and the migration agent (see Segrave 2017 for more details regarding method). For the purpose of this chapter, four key issues and findings are brought to the fore with a detailed case study, to highlight some key considerations and complexities with regards to trafficking and slavery offences that occur within the context of a marriage.

**Case Studies**

In the full report, a comprehensive account of the specific forms of abuse and exploitation is offered in relation to the prevalence of indicators pertaining to slavery and trafficking offences (Segrave 2017). The evidence below focuses specifically on indicators of offences under Australian law. There were 11 cases in the 300 cases analyzed where one or more elements of the offence specific to human trafficking in
Australia was evident. Predominantly these related to coercion, threat, and deception with respect to exit from Australia (s270.2(1A(a&b))). This was evident in Rahmina’s case.

### Rahmina

Rahmina was a 22-year-old orphan from Iran whose extended family arranged her marriage to Yousouf, an Iranian born man who now lived in Australia as a permanent resident. Rahmina and Yousouf married in Iran. Yousouf returned to Australia and Rahmina followed him a few months later, once a temporary spouse visa was granted. There had been little time to get to know each other or to spend time together prior to Rahmina arriving in Australia.

Soon after her arrival, Yousouf began placing demands on Rahmina, including that she wear Moslem clothing. He was also physically and verbally abusive. In one incident, Yousouf hit Rahmina multiple times causing serious injury. A neighbor called the police. Police called an ambulance for Rahmina and she was taken to hospital. Yousouf was taken to the police station. After receiving medical treatment, Rahmina was given accommodation in a women’s refuge. Yousouf was released on bail, and a family violence safety notice (A family safety notice is a Victorian court order that is served on a respondent by a police officer and details the conditions that prevent the respondent from using family violence. If a respondent disobeys the conditions, they can be arrested.) was issued by the police. The matter was heard at the local court a few days later. In the court, Rahmina told police that she wanted to return home to be with her husband. She said that her assault was her fault. Given the seriousness of the allegation, the police proposed an interim order with full conditions to be put in place, which prohibited Yousouf from approaching Rahmina within 200 m. Rahmina was crying uncontrollably in the court. The matter returned a few times in court until the final order with limited conditions was granted, which allowed the couple to live together.

A few months later, Yousouf told Rahmina they were going to visit his family in Iran. Yousouf told her that everything had been arranged and they would leave within an hour. At the airport, Yousouf completed the predeparture paperwork for both of them, as Rahmina’s English was limited. When they arrived in Iran, they stayed with Yousouf’s family for a couple of weeks. During this time, Yousouf and Rahmina spent little time together. One day Rahmina realized that she had not seen Yousouf for over a day and realized he had gone. Two days later, she received a phone call from Yousouf, informing her that he had returned to Australia. Yousouf said that he was angry at Rahmina for agreeing to have an intervention order being put against him (It is important to note that the order is made by the court, not by the victim/witness. Even in cases where victim survivors do not wish an order to be in place, the court can still put one in place.) and this was his revenge. Yousouf also told Rahmina that he had taken her passport, burnt it, and would withdraw his sponsorship for her to gain Permanent Residency in Australia. Following the phone call, Yousouf’s family forced Rahmina to leave their
house immediately, threatening that they cut off her nose to make it impossible for her to be desired by another man.

Rahmina sought assistance from her relatives. However, Yousouf had already contacted them, complaining that she had sought an intervention order against him, and that she had been a bad wife. She was denied assistance from all of her family with the exception of a distant uncle who agreed to take Rahmina in his care, providing Rahmina consented to a marriage to his friend, an 80-year-old man. Before Rahmina could agree to this, she first had to seek divorce from her husband Yousouf. He agreed to divorce Rahmina but demanded a payment of AUD$8000. This was not money that Rahmina or her Uncle had. Rahmina was stuck. Without a passport, Rahmina could not return to Australia. She sought assistance from multiple embassies but was consistently denied support as she had no evidence or paperwork to support her claims or to enable a passport to be issued. She eventually met an embassy officer who agreed to help her in exchange for sexual services. Rahmina was raped multiple times until the officer agreed to issue the passport for her. The minute she received the passport, Rahmina contacted one of her relatives in Australia and begged him to send her some money to buy a ticket to Australia.

Eight months after her ordeal, Rahmina returned to Australia. She sought the support of a family violence service who specialize in supporting temporary migrant women. This service supported her and referred the case, with her consent, to the Australian Federal Police (AFP) for further investigation in relation to trafficking and slavery offences. The AFP could not find sufficient evidence to put charges against Yousouf and the investigation was closed.

In Rahmina’s case, there were many complex issues including but not limited to her vulnerability upon her return to Iran, the inability for her to access support to gain the requisite documents to access a new passport, and the opportunistic exploitation and sexual assault she endured to access that. Importantly, for this analysis, was the deceptive return to Iran with the intention of leaving her there without documentation. We consider some implications of issues arising across the case studies further final section below.

Twenty of the 300 cases in the study involved discernible evidence of forced labor and servitude (It is notable that in some research and writing in the field, there are references to “servile marriage” (which is distinguished from forced marriage), but this terminology is not used in this report.), and deceptive recruiting for the purpose of these offences. There are three key areas of law pertaining to slavery-like offences (under section 270 of the Commonwealth Criminal Code) relevant here:

“forced labour”: defined under section 270.6 as “the condition of a person (the victim) who provides labour or services if, because of the use of coercion, threat or deception, a reasonable person in the position of the victim would not consider himself or herself to be free: (a) to cease providing the labour or services; or (b) to leave the place or area where the victim provides the labour or services.”

“servitude”: defined under section 270.4 as “the condition of a person (the victim) who provides labour or services, if, because of the use of coercion, threat or deception: (a) a reasonable person in the position of the victim would not consider
himself or herself to be free: (i) to cease providing the labour or services; or (ii) to leave the place or area where the victim provides the labour or services; and (b) the victim is significantly deprived of personal freedom in respect of aspects of his or her life other than the provision of the labour or services.”

“deceptive recruiting”: defined under section 270.7 (c) as causing the victim to be deceived regarding:
(i) the extent to which the victim will be free to leave the place or area where the victim provides the labour or services; or (ii) the extent to which the victim will be free to cease providing the labour or services; or (iii) the extent to which the victim will be free to leave his or her place of residence; or (iv) if there is or will be a debt owed or claimed to be owed by the victim in connection with the engagement – the quantum, or the existence, of the debt owed or claimed to be owed; or (v) the fact that the engagement will involve exploitation, or the confiscation of the victim’s travel or identity documents; or (vi) if the engagement is to involve the provision of sexual services – that fact, or the nature of sexual services to be provided (for example, whether those services will require the victim to have unprotected sex).”

Indications of labor exploitation were the most prevalent in this study. Achol’s case is an example of this, where she was effectively brought to Australia to work for her husband’s family.

**Achol**

Achol was a South Sudanese girl who was married off by her family to a distant relative Abdo. Achol’s uncle arranged the marriage and asked Abdo to give some cows to the family, as a part of their customs. Abdo promised that Achol could study and find an employment in Australia. Achol was excited. She had never travelled to other countries and always dreamt of visiting one. It is unclear how old Achol was at that time: her passport date of birth indicated that she was 19 at the time; however, it is likely she was younger. Achol was illiterate and her date of birth had never been formally registered.

After the wedding, Abdo stayed with Achol and her family before returning to Australia. Though Achol did not have a signature, Abdo managed to organize a passport for her by putting her finger print on the passport application (unable to sign) and applied for a spouse visa. After the spouse visa application was granted, Achol came to Australia. She lived with Abdo, his mother, his sister, and two of the sister’s young children. Her passport was taken by her mother-in-law as soon as she arrived. She was expected to cook, clean, and take care of the sister’s children while the sister was at work. Achol was not allowed to go out on her own, let alone to study, and find an employment as Abdo had promised. As she was illiterate, Achol did not know the address where she lived. Abdo came home irregularly, at times a week would pass between without seeing him. He would buy some groceries for the whole family and leave.
Achol was often abused by her mother-in-law and Abdo. The abuse was escalating when Abdo threatened to kill her if she did not listen to her mother-in-law. Fearing for her life, 1 day, when no one was at home, Achol left. She walked down the streets of Melbourne for about 3 h as she did not know where to go, until a pedestrian helped her and took her to a nearby homelessness service.

Achol was referred to a specialist family violence agency. She did not have any identification with her. The migration agent within the agency contacted the Department of Immigration and Border Protection (DIBP) to verify Achol’s identity. It took 2 days before DIBP was able to identify Achol through Abdo’s email address. The name on her passport was not Achol. Abdo made a mistake when applying for the passport by putting Achol’s middle name as the first name. As Achol was illiterate, she could not read it to correct it.

Achol was referred to the Australian Federal Police; however, the investigation was discontinued after a few months, as they could not find any sufficient evidence to bring the matter in to the court.

While Achol’s case raises issues pertaining to the circumstances of her marriage and her age, of concern and focus here is the utilization of marriage as a way to enable Achol to come to Australia in order to effectively work for Abdo and his family. While there may be nuanced cultural elements to these practices, there are significant vulnerabilities created for a young woman who has limited English-speaking and reading skills, who is bound to the family she has been married into and who has extremely limited capacity to engage with anyone outside of the immediate familial setting within which she found herself.

The next example, Chalai’s story, also involved indicators of forced labor, but also, elements of sexual servitude.

Chalai

Chalai was a Thai girl who met Alex, an Australian born man, via an online dating website. Alex came to visit Chalai a few times in Thailand. Chalai thought of Alex as a gentleman who was caring and generous. Whenever Alex came to visit her, Chalai would prepare various and delicious Thai dishes to spoil him. When Alex proposed to marry her, Chalai was delighted. The couple married in Thailand. Alex started the application for a spouse visa to bring Chalai to Australia. However, as the administrative process often takes some months from submission of the application to approval, Alex paid for Chalai to come to Australia on a 3-month visitor (tourist) visa.

Within weeks of arrival in Australia, Chalai recounted how Alex started becoming abusive. He demanded that Chalai worked in the Thai restaurant he co-owned with Buppha, a Thai lady. Chalai was expected to wake up around 7 am, to head to the market to buy fresh food with Alex, and to help him in the restaurant. She had to cook, serve customers, and cleanup when the business closed each evening. Alex and Chalai usually went home at around 11 pm. For the work that she did at the restaurant, Chalai was not paid as an employee. She was given approximately $50 a week in cash from Alex.
Despite these conditions, Chalai loved Alex and she loved cooking. She wanted to support Alex to build his business. What concerned Chalai was Alex’s bad temperament. He was often moody and whenever he was angry, he’d yell at Chalai and call her derogatory names. He would demand Chalai have sex with him every night, if she refused, he would kick her and force her to leave the house. A number of times Alex locked Chalai out of the house in the middle of the night in winter, which meant she would spend the night outside wearing only pyjamas and in bare feet. She recounted how she would be outside crying and begging Alex to let her in as she was tired, freezing, and afraid. The couple lived in an isolated house in a regional town in Victoria, which meant there were no neighbors to seek support from and/or to hear or report the happenings. Alex would eventually relent after some hours but would make her promise to never refuse to have sex with him again.

Chalai knew that she needed help and decided to approach Buppha. Buppha has long suspected that something has gone terribly wrong in Chalai’s relationship with Alex but did not want to interfere. After Chalai’s disclosure, she was taken in by Buppha who later referred Chalai to a specialist family violence agency. Once referred to the family violence agency, Chalai was referred to the Australian Federal Police (AFP) as the service provider caseworker felt that the deception in her marriage and/or the labor conditions may constitute an offence under the trafficking and slavery offences in the Commonwealth Criminal Code. However, following the referral and an investigation the case was closed by the AFP as they could not find enough evidence to build a prosecution. Chalai returned to Thailand.

**Implications**

The case studies above are offered to bring to the fore the complexity of women’s lives and the challenges in delineating where family violence begins and trafficking or slavery-like offences begin. The three case studies raise many issues and point to more potential offences than the area of law they are used to highlight. However, there are some important considerations to reflect upon. First, all three were cases that came to the attention of a family violence service provider. This service provider has skilled case workers who are increasingly aware of trafficking and slavery indicators and who proactively refer cases to the Australian Federal Police. This is unique in Australia, and hence the numbers being referred to the AFP is limited. Many of these cases would remain within the remit of family violence service provision in Australia. The consequence of this is the absence of any understanding or interrogation for the implications for forced labor and/or sexual servitude, or human trafficking that happens within the context of marriage. It is not that this is rare, it is that service provision in relation to family violence is not directly related to the investigative processes related to trafficking and slavery offences in Australia. This is complex and messy new terrain for service providers and authorities. As evidenced above, none of these cases were pursued by the AFP. The consequence is that we have very poor data on these complex issues. This is a persistent challenge in relation to human trafficking more broadly: that cases tend to be multifaceted and
complicated. Yet, the national and international emphasis on a criminal justice response results in the reliance on the rarest of cases to pursue a prosecution. Cases that are straightforward, where the exploitation is extremely serious and/or where this compelling evidence may more easily result in charges and prosecutions. However, given that often all of these elements are not evident in a case, reinforces the reliance on ideal victims and offenders, who are far from the messy realities of the circumstances of women, for example, who have sought an opportunity to marry, who have had a honeymoon period of happiness and whose husband-sponsor sets about exploiting via sexual servitude and forced labor in the form of working 7 days a week, 18 h a day for $50 a week as in the case of Chalai. These are complex cases to identify, and the legal system in Australia is not well equipped to respond.

Importantly, there must also be consideration of the victim-survivor. Indeed, women's safety must be the forefront of the response. These case studies are important because all of these women were able to access the best support available in Australia. They were able to be provided with highly skilled and specialized migration support and case workers focused on their well-being. There is no way to quantify how many women may be in similar situations who have not accessed services to assist them towards safety. Importantly the provision and details of the support provided to victim survivors in Australia is dependent on how the case is pursued (i.e., as a family violence offence or as a potential trafficking or slavery-related offence). This is further complicated by migration status, as women on temporary partner visas are able to access family violence supports (in relation to financial and accommodation support) and are able to apply to access the family violence provision, in order to pursue permanent residency in Australia. Women in Australia, such as Chalai, on another temporary visa that is not sponsored by their partner, have extremely limited access to welfare, financial, and accommodation support, and have no remit to migration supports based in their experience of family violence. For women in such circumstances, being referred to the AFP as a potential trafficking or slavery victims, opens up the opportunity to access the welfare service provisions available via the Trafficking in Persons Support Program. This is a very limited model of support (see Segrave 2017), but it is arguably better than no support. However, agreeing to a referral and cooperating with the AFP in order to be able to remain in Australia and not be returned to your country of origin, which may happen, is a sure way to undermine your credibility as a witness (as the victim survivor). What is clearly lacking is the breadth of service provision in relation to family violence, alongside limited recognition of the range of ways in which trafficking and slavery practices may manifest.

The final consideration arising from these cases studies, though, is the way in which the migration system and the criminal justice system can create leverage for exploitation to occur and contribute to women’s insecurity. The reliance in the criminal justice system on a witness and a case that is going to meet the legal requirements to pursue serious crime offences, translates into a system that can only pursue the rarest of cases. The consequence of that offenders are not held to account. The migration system in Australia is also designed to provide limited supports to noncitizens who experience exploitation within the context of family violence or
within the context of trafficking and slavery offences (see Segrave et al. 2018). Across both family violence and labor exploitation it is consistent that migration status is used as leverage by abusers, and that this contributes to their coercive control (Maher and Segrave 2018; Segrave 2017). There is an opportunity to change this, but focusing first and foremost on women’s safety. There is also an opportunity to review our criminal justice response and to consider how trafficking and slavery-like offences may be identified within the context of family violence. This requires further analysis and discussion; while in some instances, the relationship may not be evidenced at all (i.e., there was deception from the outset and there was no period of pretense as to a genuine relationship), which in others there is a period where a relationship seemed evident. The important consideration is the outcomes for women’s safety, from which we can then consider the best way to ensure the law is effective and efficient in identifying and responding to exploitative practices.

Conclusion

This chapter has sought to bring to the broader analysis of human trafficking, a consideration of the intersections of trafficking and slavery-like practices and family violence. There are legal and welfare implications that arise from pursuing cases as family violence or trafficking and slavery-like offences in Australia. However, rather than debating what law is most applicable, it is more appropriate to explore all potential legal avenues while ensuring that women are safe and can access the support and protections they need. Across this study what was consistent was that women’s precarious visa status as temporary migrants gave perpetrators leverage to control and abuse them, and had implications in relation to their perception of what was the best course of action. For an untold number of women in Australia, it is preferable to remain in Australia than to face being returned to their country of origin. This ought to be the beginning point for responding to all forms of gendered violence. In place of siloed responses to trafficking and family violence, there is an important opportunity to begin having conversations and developing research that recognizes the points of intersections, and to build transformative and creative responses to ensure women’s security and safety.

This chapter draws on a research project that examined the intersections of family violence and temporary migration in Australia. The discussion draws on three case studies to highlight the complex ways in which trafficking and slavery-like practices may occur in settings that have traditionally been identified as a family violence context. The chapter argues that we need to consider the overlap between these offences, but also to build a response that focuses first and foremost on women’s safety. The chapter highlights how migration and criminal law can create conditions that enable or sustain gendered violence by not recognizing anything other than the most serious of cases as prosecutable offences and by limiting access to support based on migration status. The chapter lays the ground for a new research agenda in the field of human trafficking.

Abstract

Human trafficking is known to be one of the most rapidly growing criminal industries globally, and a significant portion of this criminal industry is the trafficking of girls and women for commercial sexual exploitation and for labor (Polaris Project 2015). Trafficking, as it affects women and girls, in particular sex trafficking, is a form of gender-based violence. The lesser-valued status of women and girls worldwide places them at increased risk for abuses and exploitation. This chapter will focus on sex trafficking, as well as the sociocultural and institutionalized reasons that women and girls are vulnerable to this form of exploitation. This chapter will also address trauma related to sex trafficking and implications for psychological treatment of sex trafficking survivors.

[Authors’ Note: While sex traffickers victimize women, men, transwomen, transmen, and nonbinary adults and children, women and girls are the majority of victims of sex trafficking; therefore, these two groups will be the focus of this chapter.]
Introduction

Sixteen-year-old Alyssa was terrified the first time she was forced to have sex for money. Her trafficker, approximately 10 years her senior, hid in the bathroom of the hotel room he had rented, while Alyssa held her breath waiting for the heavy, sweating man to lift himself off her small frame. Alyssa was trafficked for 3 months; she was forced to have sex with between 9 and 21 men daily. She was beaten, raped, and drugged by her trafficker, who had convinced her he loved her in the weeks leading up to when he first advertised Alyssa on the Internet website Backpage. Alyssa believed his threat to harm her younger sister if Alyssa didn’t do as he demanded, and that, she said, was the single most powerful method of control he exerted. Alyssa’s story is not uncommon. Sex trafficking occurs in every country in the world and in every state in the United States. Traffickers use lies, manipulation, threats, debt bondage, and other forms of coercion to compel children and adults to engage in commercial sex acts against their will. In the United States, any minor under the age of 18 years involved in commercial sex is a victim of sex trafficking; this is regardless of whether there was use of force, lies, or other forms of coercion. Victims of sex trafficking can be citizens of the United States, foreign nationals, children, women, or men and may be LGBT or straight identified. However, because of the lesser status afforded to girls and women and the myriad sociocultural implications of this status, it is this group that is primarily victimized by sex traffickers.

Underlying Factors: Sexism and Gender-Based Violence

Women and girls worldwide are born into sociocultural systems in which they are disadvantaged in ways that impact their daily lives, both overtly and through means that are less easily identified. This disadvantaged social status of women and girls is socially constructed in the context of patriarchy. Patriarchy is defined as sociocultural practices and beliefs that normalize socially constructed gender differences that benefit men and oppress women (Ebert 1996). Harm and perpetuation of less privileged status are carried out by the institutions of society through structural violence (Brock-Utne 1989), in particular through the institutions of government, education, family, religion, and the economy. This means that the practices, policies, and norms of these institutions are discriminatory and function to oppress women in order to advantage men. This oppression usually takes the form of economic exploitation, although more extreme forms of sexism are characterized by brutality against women, in the forms of commodification of women and their bodies, domestic violence, sexual assault, rape, and sex
trafficking. Perhaps the aspect of this process that is most challenging is that when a way of being becomes “normalized,” or taken as the status quo, it seems to be more difficult to interrupt for it is widely accepted as “the way things are” or normative.

Sex traffickers often focus on women because as a result of these discriminatory practices, they experience high rates of poverty; both discrimination and poverty (which is often an outcome of discrimination) hinder access to profitable employment in formal market economies, making it challenging for women to financially support themselves and their children. In addition, the sexualization of women and women’s bodies, which can be considered as both a means of keeping women in a subordinate economic and social position and outcome of this subordination, fuels the commercial market for sex.

*Gender-based violence* (GBV) is important to any discussion of human trafficking, not exclusively sex trafficking, as it is both a “driver” of trafficking and a tool to control and manipulate victims. Gender-based violence is violence directed against a person on the basis of gender. It constitutes a breach of fundamental human rights including the right to life, freedom, security, dignity, equality between women and men, nondiscrimination, and physical and mental integrity. Gender-based violence affects women, girls, and nonbinary persons disproportionately (in comparison to men and boys). This reflects and reinforces the unequal power relationship between both groups in society. A review of academic research studies and project reports demonstrates a relationship between trafficking and gender-based violence, and while more information is needed, it is clear that gender-based violence plays a role in the vulnerability of women and girls being trafficked, and it is a part of their experience during the trafficking process (Winrock 2012).

Gender-based violence is grouped into the five categories of sexual violence, physical violence, emotional and psychological violence, harmful traditional practices, and socioeconomic violence. Examples of each appear below. It is important to keep in mind that these are examples and that there are many forms of each of these five types of GBV:

1. *Sexual Violence* – rape and marital rape, sexual abuse and child sexual abuse, sexual exploitation (defined as any abuse of a position of vulnerability, differential power, or trust for sexual purposes); this includes profiting monetarily, socially, or politically from the sexual exploitation of another, forced prostitution, and sexual violence as a weapon of war and torture. 

   *Note about sexual exploitation and forced prostitution:* these are the cornerstone of sex trafficking and are characterized by a woman or girl being forced to perform in a sexual manner (e.g., forced nakedness, forced pornography, forced prostitution, forced or coerced marriage, or forced childbearing) in exchange for money that is given to a third party.

2. *Physical Violence* – includes physical assault such as hitting, punching, beating, biting, burning, and kicking and the selling, purchasing, or trading in human beings for forced labor (or forced sexual) activities.
3. **Emotional and Psychological Violence** – stalking, harassment, humiliation, manipulation, coercion, degrading treatment, and confinement (i.e., isolating a person from others, restricting freedom of movement).

4. **Harmful Traditional Practices** – early or forced marriage, honor killing and maiming, female genital mutilation (FGM), infanticide, neglect of female children, denial of access to medical care including safe legal abortion for girls and women, and denial of education for girls or women.

5. **Socioeconomic Violence** – discrimination and/or denial of opportunities; harassment in education or employment settings; denial of access to education, health care, remunerated employment, and/or property rights; biological fathers’ abandonment of mothers and children which contributes to increasing feminization of poverty; and obstructive or otherwise biased legislative practices.

While progress has been made with regard to laws, social thinking, and norms on the issue of violence against women and girls, institutionalized and cultural forms of violence against women remain entrenched in the United States and globally. These structures of dominance enforce the vulnerability of women and girls to sexual exploitation and sex trafficking (Heise et al. 2002; Hughes 2005; Reed et al. 2010).

---

**Defining Sex Trafficking in the Context of the Commercial Sex Industry**

Sex trafficking is part of the commercial sex industry in which women, girls, and boys are exploited for sex trafficking within their country of origin as well as across country boarders. In the United States, anyone under the age of 18 who is involved in a commercial sex act where a third party is profiting from the exchange is considered a victim of sex trafficking. Sex trafficking is carried out by criminal organizations (e.g., mafias) but also by less structured criminal networks, by individuals (e.g., pimps), and by family members of victims (UNODC 2014). It is estimated that profits from sex trafficking represent approximately 2/3 of what is believed to be $150 billion in illegal funds generated each year by all human trafficking around the world (ILO 2014). Sex trafficking can occur in any area of the commercial sex industry, which takes many forms including street prostitution, strip clubs, outcall services/prostitution, child and adult pornography, Internet pornography/interactive sex play exchange, phone sex, and sex tourism.

All too often, sex trafficking and prostitution are confused. Legally, prostitution is defined as (1) the promotion of or participation in sexual activities in exchange for something of value such as cash or drugs, including attempts or the solicitation of customers or transport of persons for prostitution purposes; (2) the ownership, management, or operation of a dwelling or other establishments for the purpose of providing a place where prostitution is performed; or (3) the assisting or promoting of prostitution. While the exchange of sex for money, even between consenting adults, is illegal in most of the United States, it does not constitute sex trafficking or sexual exploitation. Of significance is that increasingly, it has become clear that the
elements of force, fraud, and coercion that are part of sex trafficking are sometimes difficult to identify and therefore may not be readily recognized or screened for by law enforcement, who commonly charge women with the crime of prostitution when they may actually be victims of sex trafficking (Potterat et al. 2001). Women involved in prostitution are arrested far more often than the (usually) men who purchase sex. This has drawn criticism from many and is seen by some as a manifestation of sexism. The authors also note that there is a fierce debate in the anti-trafficking field between the view that prostitution is never a choice but always an activity engaged in under the coercive distress of patriarchal systems which commodify women’s bodies and disenfranchise women from economic security. This view is sharply criticized by organized sex workers, who include men and nonbinary adults and their allies. This second group advocates for policy changes to improve their safety and security and recognizes that not all persons involved in commercial sexual activity are able to determine their own hours, rates, and work conditions within their labor market.

**Risk Factors for Sex Trafficking**

Those at risk for sex trafficking most often come from vulnerable populations including undocumented migrants; runaways; domestic violence victims; lesbian, gay, bisexual, transgender, and other nonbinary (LGBT+) youth; youth in the juvenile justice and delinquency systems; other at-risk youth, females especially African American girls in the United States; members of other oppressed or marginalized groups; and the poor. Traffickers target individuals in these populations because they have few resources, limited social support, and limited work options. Such factors make these populations easier to recruit through deception or force, and they tend to be easier to control.

At-risk youth and runaways are targeted by traffickers and by pimps for sex trafficking as well as labor exploitation and begging (Estes and Weiner 2002; Finkelhor and Ormrod 2004). Pimps and sex traffickers manipulate victims and are known to use of a combination of violence, affection, and abuse of other victims in a group in order to cultivate loyalty in victims. This can result in *Stockholm syndrome*, a psychological phenomenon wherein hostages experience and express empathy and positive feelings for their captors or abusers. This is more likely to develop with children and teenagers than with adults. This psychological manipulation reduces the victim’s likelihood of acting out against the trafficker. Research suggests that emotional and sexual abuse in childhood, ever having run away from home, rape, having family members involved in the commercial sex industry, and having acquaintances or friends who have purchased sex are all significantly associated with child sex trafficking within the United States (Fedina et al. 2016).

In the case illustration below, Barbara Amaya shares her story of being a runaway youth and how that led to her being trafficked.
When I was 12 years old, on one of the many occasions I had run away from home, I was gang raped in the streets of Washington, DC. It happened under the street in a maintenance room in the Thomas Circle tunnel.

A man began talking to me on 14th Street and then lured me into the tunnel area, where eight to ten filthy homeless men raped me, repeatedly. They laid me on a table and took turns. I told one of them I needed to pee while he was on top of me. He said “Go ahead.”

I don’t think I was ever quite the same after this trauma. I stopped talking, began to disassociate more frequently, began to pull my hair out, and contracted a venereal disease consequent of this gang rape. When I returned home, I told my mother something was wrong and showed her my body. She took me to the doctor. He examined me, and they gave me medicine. No one in the doctor’s office asked me what had happened, or really talked to me at all; they didn’t seem to be concerned with how a 12-year-old girl from Fairfax Virginia had contracted a venereal disease.

Another time after running away from home, I was kidnapped by a violent man. He took me to his home and raped me multiple times. When I tried to escape, he stabbed me in my neck with a table fork.

By the time I was close to 13 years old, I was under the control of a brutal sex trafficker and remained so for over a decade. It was my experience that when someone paid for my body, they believed they could do whatever they wanted to it. I endured beatings with wire coat hangers from the trafficker if I didn’t bring him enough money. I was robbed, raped, beaten, and threatened with death at the hands of the buyers.

I have been raped and trafficked for sex so many times I cannot remember the exact number, in the thousands no doubt. With each of these traumas, a part of me died, but not completely.

Inside, I still held the will to survive. I think we all have this will to keep going.

Undocumented immigrants are extremely vulnerable to being trafficked due to a combination of factors (Human Rights Watch 2012). Some of these factors include lack of legal status and related protections, poverty, few employment options, immigration-related debt, limited language skills, and social isolation. It is not uncommon for undocumented immigrants to be trafficked by those from a similar ethnic or national background and whom the victims may trust due to their common background.

Regions impacted by political instability and war create situations that foster trafficking. In particular, long-term military occupation and the presence of “peacekeeping” troops feed the commercial sex industry in these areas and facilitate sex trafficking of women and girls (Mendelson 2005; Morris 2010). Natural disaster also increases the risk and likelihood of trafficking. Natural disasters can destroy communities in a matter of minutes and create tremendous physical and economic insecurity. Children can be separated from their caregivers, making them prime targets for sex traffickers. The December 2004 Indian Ocean earthquake and tsunami is an example of one such natural disaster, where the lives of close to a million children were placed in danger. In this situation, seemingly for the first time, a concerted effort was made to stop trafficking before it could begin. Another example,
although with a more problematic outcome, is the 2007 drought in Swaziland during which ECPAT International (End Child Prostitution and Trafficking) found increases in trafficking of children; there were reports of parents trading their children for food and water. Natural disasters not only impact children, they also increase adult vulnerability to trafficking. The kind of widespread devastation caused by this type of disaster can seemingly spontaneously create poverty and make it extremely difficult to meet basic needs. This may lead to immigration that can lead to victimization by a sex trafficker.

As illustrated, risk factors for sex trafficking are numerous and at the macro level include exposure to “compromised” or weak social institutions (Heil and Nichols 2015). The institutions of most significance to vulnerability in the United States are education systems, economic systems, criminal justice systems, and family systems.

Risk factors are also closely associated with identity-based oppression. An intersectional perspective indicates that each individual holds unique and intersecting identities that impact one’s lived experience. These identities include sex/gender (as previously noted), race, class, age, sexual orientation, ethnicity, and religion. In the United States and elsewhere, factors such as racism and classism become the structural barriers that oppress those who are politically, economically, or culturally disadvantaged. This ends up to be primarily women and girls who are oppressed by their race and class in addition to their sex (Kurtz et al. 2005). Unfortunately, across cultures, there tends to be marginalization of groups along these lines, and those who embody the marginalized position in one or more of these identity categories are at increased risk of different forms of victimization, including sex trafficking.

Survival sex is closely associated with runaway youth and is also referred to as trading sex and transactional sex. These terms are used interchangeably and refer to a sexual favor in exchange for something of value such as food, shelter, or clothing (Tyler and Johnson 2006). These terms are used mostly to describe the exchange of sexual acts for money or for something of financial value among youth and young women, often as a method of attempting to meet basic needs for survival (Greene et al. 1999; Tyler and Johnson 2006).

Methods of Recruitment

Sex traffickers use a variety of tactics to compel children and adults to engage in commercial sex acts. As mentioned previously, methods employed are often characterized by fraud, coercion, or force. According to federal law in the United States, a minor (someone under the age of 18 years) involved in a commercial sex is considered a victim of sex trafficking. Meaning, the minor is considered a trafficking victim whether or not the trafficker used force, fraud, or coercion; the minor is not of age to consent to commercial sex.

It is not uncommon for the trafficker to trick the victim into becoming romantically involved and then to use force or additional forms of manipulation to compel engagement in commercial sex. Other recruitment strategies may include false
promises of employment, such as working as a nanny, model, or dancer. In some situations, family members, including parents or others in the primary caregiver role, sell their children to traffickers or directly broker of commercial sex involving their children.

Sex trafficking can occur just about anywhere. Common locations include businesses such as massage parlors and escort services, in brothels, at truck stops or similar travel rest areas, in hotels or motels, and on the street. In addition, sex trafficking is not limited to in-person exchanges and can exclusively take place online.

Social networks and more personal relationships serve as a powerful tool of recruitment for traffickers. Through these relationships, trust is easily achieved, making it easier for the offender to recruit friends of friends, friends of family members, and friends of other girls they have trafficked. Recruiting can take place in any number of places such as malls, schools, bus/subway/train stations, amusement parks, beaches, and college campuses. As noted previously, some traffickers engage in feigned romantic or physical relationships with young girls and women, preying on the emotional and economic needs of the individual. They begin to build a romantic relationship with the person and then ask that they engage in commercial sex to help support them; this sometimes is done gradually, for example, with the trafficker encouraging or more aggressively pushing the victim into dancing in a strip club to more serious commercial sex acts.

The Internet has become a very active location for both the recruitment of sex trafficking victims and advertising the sale of sex to purchasers. Sites that mirror Craigslist in layout and function are used both to recruit victims (Fig. 1) and to draw in those who want to purchase sex (Fig. 2). Recruitment advertisements tend to appear to be for legitimate employment, typically offering opportunities for

![Image of the “entry page” for both Craigslist and Backpage](image-url)
modeling or dating services described as “upscale.” In some instances, more traditional jobs are advertised. For example, in the early 2000s, two college-aged women from Russia responded to an ad on Craigslist for office work in Pittsburgh, Pennsylvania. The women were picked up from the airport and transported to a popular Pittsburgh neighborhood where they were detained and trafficked for sex out of a home in a residential area. This story ended well in that the women escaped and were assisted by the Pittsburgh FBI and the Western PA Human Trafficking Coalition.

Current victims of the trafficker are often used to recruit additional women and girls. Slang terminology for these individuals is “bottoms” and sometimes the trafficker is “easier” on this person, making it an appealing position for the victim to hold. This creates a tricky situation when law enforcement is involved because despite also being a victim, action as a recruiter places the person at risk for a criminal trafficking charge. Social media platforms such as Facebook are used to recruit girls, boys, and women to sell. For example, traffickers will “friend” an individual, compliment them on their appearance, and offer modeling work. See Fig. 3 for an example of such an online dialogue.

The promise of economic support has been repeated time and again by sex trafficking survivors as what initially drew them to the trafficker. Traffickers are
aware of this and display their wealth with the intention of attracting victims who often have no social safety net or means to provide for themselves.

Methods of Control

Traffickers use a variety of methods to control victims that broadly include contrived affection, acts of physical violence, and psychological/emotional abuse. In sex trafficking, there is typically a complex relationship between the victim/survivor
and the trafficker that makes psychological manipulation a primary method of control. It is not uncommon for the trafficker to have cultivated romantic feelings in the victim as a way to engender attachment, trust, and loyalty. Traffickers use threats of harm to the family of victims as a means of control. For example, traffickers will threaten to pull a sister of the victim into sex trafficking, threaten physical harm to other family members and for victims who have children, the trafficker will often use access to the child to control the victim. Additional methods include sexual abuse, physical violence (hitting, punching, burning, etc.), induced drug dependence or addiction, isolation, confinement, and constant monitoring. Exerting control over seemingly small decisions in the victim’s life is also a way of reducing the sense of autonomy or self-determination of a victim, thereby making them easier to manage for the offender, for example, making rules about what time the victim goes to sleep, awakens, when the bathroom may be used, how much toilet paper is permissible for use, and when and what is consumed at mealtimes. Economic abuse is characteristic of trafficking, and survivors in large note severely restricted access to financial resources, further deepening dependence on the trafficker, even for the most basic of necessities.

### Mental Health-Based Implications: Post-traumatic Stress Disorder

Sex trafficking victims often suffer serious physical and sexual abuse, exhaustion, and starvation. Because those who have been trafficked for sex have often been subjected to multiple abuses over an extended period of time, they may manifest physical and emotional health symptoms similar to those experienced by victims of the trauma of domestic violence or prolonged torture. What follows is an explanation of trauma and considerations for therapists and other social service and law enforcement professionals interacting with survivors.

Trauma is defined as an experience that threatens one’s sense of safety and security and may or may not involve physical harm. Trauma is typically experienced as either a single or a repeating event that overwhelms an individual’s coping mechanisms and interferes with one’s ability to integrate and make sense of emotions and thoughts related to the experience. According to the *Diagnostic and Statistical Manual of Mental Disorders 5* (American Psychiatric Association 2013), a traumatic event is one that involves “exposure to actual or threatened death, serious injury, or sexual violence” (pp. 271). Exposure does not have to be direct and may include exposure through verbal account of another’s experience of visually through media. Sex trafficking victims, because of their exposure to physical, emotional, and physical violence, are at increased risk for developing PTSD.

Symptoms of PTSD are grouped into four categories: (1) intrusion/traumatic re-experiencing (e.g., flashbacks), (2) avoidance, (3) autonomic nervous system hyperarousal, and (4) negative alterations in cognition or mood. In order to meet the diagnostic criteria of PTSD, symptoms in each of these categories must be present.
Intrusion symptoms include memories of the event which are involuntary, intrusive, and distressing. Distressing dreams, dissociative reactions, distress at exposure to triggers of the event, and physiological reactions to trauma cues are also included in this cluster. Avoidance is the next symptom set. This is characterized by efforts to avoid thoughts or feelings associated with the trauma and/or efforts to avoid external reminders that activate memories of the event.

Negative alterations in cognition or mood is a symptom cluster that was recently added for the DSM-5. This refers to a broad range of symptoms including an inability to remember aspects of the event; exaggerated negative beliefs about oneself, others, or the world; distorted cognitions of guilt; negative emotional state; anhedonia; feelings of detachment; and inability to experience positive emotions.

The final cluster, hyperarousal or hyper-reactivity, is evidenced by irritability, recklessness, exaggerated startle response, problems with concentration, and sleep disturbance.

To meet a PTSD diagnosis, the duration of the four latter criteria must persist more than 1 month and in some cases may last throughout a life span, causing significant distress or impairment in social, occupational, or other areas of functioning. Complicating early and accurate diagnosis is the fact that individuals may not exhibit PTSD for months or years following the traumatic event, only to be triggered by a situation that resembles the original trauma.

An important consideration in working with survivors of the trauma of sex trafficking is understanding the extent to which they have trauma experiences predating victimization in trafficking. Trauma in early life is important for mental health professionals to understand because the way our clients think and feel about themselves and the relative safety of the world around them has meaningful implications for mental wellness and quality of life. The limited coping skill characteristics of infants and young children leave them at increased risk for negative outcomes associated with trauma in later life, such as that of sex trafficking.

Trauma reactions exist on a continuum based in part on the characteristics of the victim and the nature of the trauma (Briere and Spinazzola 2005). One end of the continuum is characterized by less complex reactions that are predominantly single-occurrence, adult-onset traumatic events: one-time trauma events in which the victim is an adult with a normal developmental history, a secure base for attachment, and no other psychological disorders. More complex trauma reactions exist on the other end of the continuum and typically include victims who are more vulnerable at the time of the trauma. This may mean earlier age of onset, multiple incidents as with sex trafficking survivors, and protracted trauma experience. The nature of the traumatic event in these situations is often interpersonal and invasive, such as with sex trafficking, child abuse, or rape.

Survivors of sex trafficking may experience trauma reactions characterized by dysregulation in emotion/affect, behavior, bodily functioning (e.g., somatoform disorders), interpersonal functioning in relationships/attachment, consciousness (e.g., dissociation), self-perception/self-concept, and systems of meaning. Children who have experienced sexual violence will react in various ways to protect
themselves and to exercise emotional reactions to the trauma. These reactions are often observable through behaviors and fall into categories of externalizing behaviors (e.g., aggression toward other children or toward self, as with sexual acting out) or internalizing behaviors (e.g., depression, withdrawal). Other protective strategies include the emergence of primary or secondary defense mechanisms (see McWilliams 1999) or dissociation. Symptomology in children that is consequent of abuse is expressed in dysfunction in the educational setting, familial relationships, and relationships with peers.

Dissociative responses to trauma are not specific to any particular type of trauma. However, they are generally thought to be more common in situations of childhood sexual abuse (Freyd 1996) and are a key diagnostic feature of complex trauma in children. Dissociation can be defined as disruption in a person’s psychological integration of experience. In other words, dissociation interrupts “contact” across domains of functioning (e.g., thinking, feeling, emoting, etc.). It begins as a protective factor against feelings and thoughts that seem utterly unbearable. It also exists on a continuum, with one end characterized by normal daydreaming and the other by dissociative disorder that may include depersonalization, psychic numbing, or amnesia regarding details of the traumatic event. Like other protective defense mechanisms, dissociation can become problematic.

For mental health professionals, it is important to approach sex trafficking survivors with an understanding of the implications of sexually based trauma as well as a strong theoretical foundation that will allow for robust explanatory power to deepen understanding of the implications of prolonged and severe abuse on the psychology of the survivor. Trauma expert Judith Herman (1997) has aptly captured the significance of childhood trauma: “Repeated trauma in adult life erodes the structure of the personality already formed, but repeated trauma in childhood forms and deforms personality” (p. 98).

Summary

Sex trafficking occurs in the United States and in countries around the world. Vulnerable populations are frequently targeted by traffickers, including runaway and homeless youth, as well as victims of domestic violence, sexual assault, war, or social discrimination. Victims of sex trafficking are disproportionately women and girls and usually become involved in sex trafficking through fraud, coercion, or force. While no movement is necessary for sex trafficking to occur, when there is movement it is typically toward more densely populated regions with large commercial trade centers or areas with large military bases.

Sex trafficking situations can be widely variable with regard to how victims are entrapped, to the age of the victim to the context in which s/he is being victimized. Some victims are tricked into romantic involvement with the trafficker, while others are responding to online, in-person, or word of mouth advertisement for work. In other instances, some are sold by family members or other primary care givers.
Sex trafficking victims may be trafficked one time or for days, months, weeks, or years. Regardless of the duration of victimization, survivors are subjected to a range of physical and sexual violence and emotional abuse, which often results in post-traumatic stress disorder. It is important that those working with survivors connect them with licensed mental health providers who can treat the psychological effects of sex trafficking.

While legislative and grassroots efforts worldwide have enhanced capacity to identify and reduce cases of sex trafficking, it continues to be misunderstood and goes unnoticed or misidentified. Continued efforts and funding in support of all iterations of anti-trafficking work will allow us to build on what has been done over the past 18–20 years and ideally serve to reduce or eliminate this crime.

Abstract

Although sex trafficking has been a social issue long before the conception of the Internet, the arrival of a worldwide network has increased sex traffickers’ reach and anonymity, potential victims’ vulnerability, and buyers’ selection, driving an explosion in sex trafficking and exploitation. Via the Internet, sex traffickers can advertise trafficking victims anywhere in the world. However, data mining initiatives allow law enforcement agencies and researchers to gather and analyze data from web pages that potentially contain sex trafficking information. Addressing the need for public security in this domain requires the use of these technologies via data aggregation, analytics, and computational forensics. For example, DARPA created the Memex program in order to index the data from web pages on the deep web. The Memex program shares similarities with popular search engines, which index the web pages that most users access every day. Gathering and analyzing data in new ways will allow for a greater understanding of how sex trafficking is being performed in the digital world by providing insight into the modus operandi of sex traffickers and providing valuable information.

**Introduction**

 Trafficking existed before the conception of the Internet, but the arrival of a worldwide network increased traffickers’ reach and anonymity, potential victims’ vulnerability, and buyers’ selection. This chapter examines how the digital age has affected human trafficking in general – and sex trafficking in particular – as well as the actions being taken to prevent sex trafficking in the United States and abroad. First, the chapter discusses the victims of trafficking. Understanding the targeted individuals and what risks they face is crucial to understanding the process of being trafficked for sexual exploitation. Next, the focus shifts to traffickers and how they operate in the digital world. Traffickers use a variety of digital tools to lure victims and attract buyers. Following that, the chapter discusses how traffickers leverage technology for their benefit. Finally, the chapter analyzes current and upcoming prevention methods. There are many programs and initiatives in place that focus specifically on combatting sex trafficking. Understanding how they address the challenges inherent in investigating sex trafficking provides a more comprehensive understanding of all types of trafficking in the digital world.

**Victims**

The Victims of Trafficking and Violence Protection Act of 2000, enacted by the US Congress, defines labor trafficking and other types of trafficking for services as “the recruitment, harboring, transportation, provision, or obtaining of a person for labor or services, through the use of force, fraud, or coercion for the purpose of subjecting to involuntary servitude, peonage, debt bondage, or slavery” (U.S. Congress 2000). It goes on to discuss sex trafficking as one of the “severe forms of trafficking in persons” where “a commercial sex act is induced by force, fraud, or coercion, or, in which the person induced to perform should an act has not attained 18 years yet” (U.S. Congress 2000). With all the information of the Internet at their fingertips, it is easier than ever before for traffickers to recruit victims from social media like Facebook and Twitter. Similarly, due to the information available on the Internet – such as location check-ins on social media – traffickers can potentially locate and transport the victim via coercion or force. However, the trafficker does not have to utilize force, fraud, or coercion in order to be guilty for trafficking a minor. If the
victim is under 18 years old, the trafficker is guilty simply by persuading a minor to engage in a sexual act (U.S. Congress 2000).

The United Nations Global Initiative to Fight Human Trafficking (UN-GIFT) found that trafficking victims are used in a variety of industries, such as: “construction, manufacturing (e.g., textile, metal, wood), industrial fishing and fisheries, agriculture, domestic servitude, mining, quarrying, food processing, forestry, leather and tanning, carpet-weaving, [and] livestock” (International Organization for Migration 2009). Due to the ease of communication, traffickers can promise opportunities of gainful employment in other regions or countries. However, when the victims arrive, the traffickers force them to do jobs such as those mentioned above. The victims may be forced to work without pay or may have their identification papers taken from them which prevents them from escaping the trafficker.

In their white paper, Chawki and Wahab (2005) included an account of a trafficking victim from Mali. The authors discuss how information and communication technologies, or ICTs, are often used for criminal means such as trafficking. The victim, Seba, was contacted in chat room; the traffickers promised Seba could live with their family in Paris, France, and get a French education. Instead she was made to cook, clean, and care for the traffickers’ children:

One day I told her that I wanted to go to school. She replied that she had not brought me to France to go to school, but to work for her and for her child.

I was so tired and run down. I had problems with my teeth; some my [sic] cheek would swell and the pain would be terrible. Sometimes I had stomachaches, but when I was ill I still had to work. Sometimes when I was pain [sic] I would cry, but my mistress would beat me.

I slept on the floor, my food was her leftovers. I was not allowed to take food from the refrigerator like them, if I would take food, she would slap me. She beat me with the broom, with kitchen tools, or whipped with electric cable. Sometimes I would bleed; I still have marks on my body.

Seba described how at one point the traffickers threw her out, but she did “understand anything” and simply wandered the streets until her traffickers found her and took her back to their house. She was then tied up, beaten, and had chili peppers rubbed into her wounds (Chawki and Wahab 2005). Seba’s experience illustrates not only how trafficking victims are often lured but also the hopelessness they face when they are trafficked. Even if they are able to escape, or let go in Seba’s case, trafficking victims often find themselves in unfamiliar countries or regions where they do not know the language or culture. Victims are removed from their support systems and abused and may not know where to go for help.

In cases of transnational trafficking, victims may not even feel they can go to the authorities for help because they are in the country illegally. In the United States, the department of Immigration and Customs Enforcement (ICE) routinely raids companies that may have undocumented migrants. Some local laws stipulate that when law enforcement officers stop individuals to check their immigration status, they can also check to see whether the individual has other violations (Brennan 2010; Gardner 2015; Weitzer 2014). Migrant workers could be victims of trafficking, but due to government policies, they may not come forward for fear of jail time or the risk of
being deported. Even if the victim entered the country legally, all the trafficker has to do to coerce the victim is to hold their travel documentation hostage (Landesman 2004). This tactic can affect all victims of transnational trafficking.

In regard to the issue of sex trafficking, it is important to note the difference between sex trafficking and commercial sexual exploitation (CSE). Human rights organization Love146 differentiates sex trafficking from commercial sexual exploitation by the presence of a third party: “CSE is defined as the abuse of power differentials or the exploitation of a person’s vulnerabilities in order to exchange a sexual act(s) in exchange for something of value” (Kim et al. 2015). Commercial sexual exploitation involves the trafficker providing something the victim needs such as a place to stay in exchange for sexual acts. Sex trafficking involves a third party, the buyer, benefiting from the victim. In exchange, the buyer pays the trafficker for the time spent with the victim.

Although researchers are aware of the types of victims that traffickers target online, as well as the potential risks victims face while browsing the Internet, very little empirical research exists on the prevalence of child sex trafficking on the Internet (Mitchell and Boyd 2014). A study conducted in 2009 concluded that 5% of youth, between the ages of 1 and 17, experienced sexual victimization within their lifetime (Finkelhor et al. 2009). The same year, the National Crime Victimization Survey found that teenagers, between the ages of 12 and 15, experience violent crime victimization at a rate more than double the national average (Truman and Rand 2009). Online sex trafficking represents a subset of these statistics.

Victims of sex trafficking tend to be young women originating from all over the world. A report from the Human Trafficking Data Collection and Reporting Center found that 70% of all sex trafficking victims are under the age of 24, and 30% are under the age of 18 (Farrell et al. 2008). The same report found that an overwhelming majority of those victims were young adult women and juvenile girls, 98% and 94%, respectively (Farrell et al. 2008). The report documented victims who originated primarily from within the United States and developing countries such as Mexico, China, and South Korea. Traffickers also target juvenile boys and young men, but their primary victims are young women and underage girls. While the research to examine online victims of sex trafficking is still nascent, it is safe to say that the number of victims is significant. Furthermore, the number of victims is likely to rise in the coming years as it becomes easier and easier to connect and communicate on the Internet.

### Traffickers

Before the advent of the Internet, traffickers and sexual predators needed to have physical access to their potential victims. However, with the popularity of chat rooms in the 1990s, and the rise of social media in the 2000s, traffickers can electronically connect with victims regardless of physical distance. Traffickers are able to advertise opportunities to work and live abroad and can attract victims across international borders (Sciadas 2005). Sexual predators utilize the Internet to
exchange child pornography, attempt to lure victims and engage them in sexual acts, encourage juveniles and young adult victims to send pornographic photos, and exploit women and children for sexual tourism (Taylor et al. 2015). Sexual tourism can be defined as traveling “with the intent to engage in sexual behavior for commercial gain and/or personal gratification” (Taylor et al. 2015). The clients are often wealthy men who travel to a developing or third-world country to engage in sexual acts that are either illegal or viewed as deviant in their own country; they usually seek out adolescents and children (Taylor et al. 2015). The risks to victims online are myriad.

Organized crime groups can easily extend their reach internationally by harnessing the technology available to them. The United Nations Convention against transnational organized crime declared that transnational organized crime is a critical security issue for the world’s nations to address (Lavorgna 2003). Transnational groups advertise the opportunity to travel to a new country or region and promise the victims they will help secure travel plans, living accommodations, and visa documentation once they arrive (Sciadadas 2005).

Typical examples for job opportunities include positions such as dancers or servers at a restaurant (Stoecker 2000). After luring the victim, the trafficker offering the position may coerce the victim into slave-like working conditions, become the victim’s pimp, or may only be the bottom rung in a human trafficking chain. The trafficker might only be serving as a local representative of the criminal group, whose responsibility is to send the victim to an intermediary contact in another city or country (Stoecker 2000). Once the victim has been transported, the local trafficker or intermediary contact establishes a connection with a buyer, and the victim’s services are sold. As opposed to the drugs and firearms, a criminal group may also sell; they “can sell a human over and over again” (Gardner 2015).

Traffickers utilize many electronic venues in order to lure and sell their victims. Websites such as Craigslist and Backpage easily allow the trafficker to advertise the victim as an escort, masseuse, or companion. The use of classified advertisement websites has allowed traffickers to continue to advertise in the physical world but has also established “virtual red light districts’ [to] provide a low risk environment for buyers to connect with sellers” (Ibanez and Suthers 2014). Victims are advertised ubiquitously for the ease of potential clients. One law enforcement investigator said, “Almost everyone being prostituted is advertised on some type of advertising or social media site” (Mitchell and Boyd 2014).

The process for luring a younger victim is different than those that can feasibly travel by themselves for the promise of a job. Generally, when attempting to lure a child or young teenager, the trafficker attempts to gain the victim’s trust and build a relationship. Traffickers use many different tactics to engage their victims. The trafficker may begin indirectly, by sending a link to a pornographic site or engaging in a sexual conversation. The trafficker may also try to normalize sex acts, such as juveniles having sex with adults (Taylor et al. 2015). As the relationship progresses, the trafficker will attempt to isolate the victim – to alienate them from their support network of family and friends – and establish reliance on the trafficker (Finkelhor et al. 2009). Older children and teenagers seem to be the most at risk for these...
interactions. Young people in this age range often have Internet access, but a parent
or guardian may not be monitoring their activity. Traffickers attempt to establish trust
and dependency by physically meeting up with the victim and then presenting the
victim with gifts, food, or money. Eventually these seemingly kind acts lead to the
trafficker asking them for sexual acts in exchange. Once the trafficker has the victim
in their possession, the offender may utilize any combination of attempts to ensure
the victim’s captivity and dependency. The offender may physically punish or
threaten the victim or their family in order to ensure the victim’s submission
(Dixon 2013).

Mitchell and Boyd reported that over half of the law enforcement investigators
included in the study found technology to be nearly inseparable from their sex
trafficking cases (Mitchell and Boyd 2014). The law enforcement officials noted
that between 76% and 100% of their cases involved technology in some way
(Mitchell and Boyd 2014). When technology was a part of the case, it played a
“very important role” in 33% of cases and an “extremely important role” in 60% of
the cases (Mitchell and Boyd 2014). One law enforcement official explained the
value of technology in relation to sex trafficking: “The crime is the same, the way
they communicate to commit the crime has changed” (Mitchell and Boyd 2014). The
Internet is invaluable to traffickers and buyers because it allows them to expand their
habits to the digital world with slight modification and significant beneﬁt: perceived
safety and anonymity and a much greater pool of potential clients and victims.

Technology Used for Trafficking

Due in part to their relative anonymity, traffickers have routinely utilized digital
classified websites, such as Backpage, Craigslist, and social media sites, in order to
advertise their victims. Traffickers also utilize everything from niche websites to
smartphone apps to advertise to and communicate with clients (Mitchell and Boyd
2014). The ubiquitous nature of technology allows traffickers and buyers to com-
municate seamlessly. Buyers can access the advertisements as easily as they can look
for a used television. They can peruse the ads from their phone, tablet, or computer
while they are at work, school, or home. With the aid of classified websites and
social media, traffickers have attempted to normalize the process of buying or
renting a victim, so that the buyer is more detached from the trafficker, the victim,
and the act. The virtual experience allows the buyer to perform their research to
decide which victim to contact and make a decision in a low-risk environment. They
can do everything, except for the physical act, from the comfort of their normal
surroundings (e.g., their own home, their ofﬁce).

Prepaid, or burner, phones have helped to increase traffickers’ accessibility and
anonymity. Many traffickers have prepaid phones set up to link themselves to their
advertisements. Traffickers often link multiple advertisements to their prepaid phone
number. Prepaid phones are convenient because in several countries, purchase of a
prepaid phone does not currently require personal information or a service contract
to set up. Law enforcement cannot link the prepaid phone back to the trafficker
unless there is identifying information linked to the prepaid account. The only information that law enforcement can obtain is the original location of the prepaid phone’s purchase (Ibanez and Suthers 2014). A content analysis of the Louisville, Kentucky, Backpage website found that adult advertisements had contact area codes from all over the United States (Hayden 2014).

A significant portion of sex trafficking occurs via “adult classified” advertisements. Sex traffickers utilize classified advertisements to promote trafficked victims. Adult classifieds, and similar posts promoting prostitution or sexual tourism, appear on both the surface web and the deep web. The surface web, in this context, can be defined as sites indexed by search engines such as Google, Yahoo, and Bing. Conversely, the deep web is the majority of the Internet that is not indexed by search engines. Therefore, the user needs specific software, configurations, or information in order to access a given website or web page. On the surface web, Backpage.com has been the most common location to find adult classifieds over the past several years (Goldman 2016).

In the past, both Craigslist and Backpage were accused of facilitating sex trafficking (Dixon 2013; Hayden 2014). However, Craigslist removed its adult services in 2010. Since that time, Backpage became the dominant force in the commercial sex advertising market (Goldman 2016). The company’s total sales are more than $150 million; $100 million comes from adult classified advertisements (Goldman 2016). There are other niche sites that offer adult classifieds such as: Myredbook.com, TheEroticReview.com, CityVibe.com, and NaughtyReviews.com. However, the Backpage competitors have a stigma associated with them (Ibanez and Suthers 2014). Backpage is more commonplace and thus is not considered merely a site that a “John” or sexual tourist would visit (Ibanez and Suthers 2014).

Special events, namely, sporting events, have been found to increase online sex trafficking sales. Hayden (2014) analyzed Backpage adult advertisements in Louisville, Kentucky, for 15 months. The study concluded that on average, there were 53 adult ads posted per day. During major events such as the Kentucky Derby, the number of postings per day increased (Hayden 2014). As mentioned above, Hayden (2014) also found that area codes from across the United States were included in the local sex ads. Ibanez and Suthers (2014) found that traffickers frequently change locations along circuits or routes. It is possible that the distant area codes recorded by Hayden were contacts for traffickers who were staying in Louisville, Kentucky, temporarily as part of their trafficking circuit.

Senators Rob Portman and Claire McCaskill have led the Permanent Subcommittee on Investigations’ attempts to gather information regarding the adult ads on Backpage. Carl Ferrer, CEO of Backpage, has been uncooperative with the subcommittee (Everett 2016). In addition to reportedly stalling Portman and McCaskill’s efforts, Ferrer failed to comply with a subpoena (Everett 2016). The Senate subcommittee examined Backpage’s current policies for processing adult classifieds. The National Center for Missing and Exploited Children testified, “71% of all reports of suspected child sex trafficking” were found to be linked to Backpage (Goldman 2016). The subcommittee found that Backpage edits the content of advertisements to remove potentially illegal references to prostitution before publishing the post:
we find substantial evidence that Backpage edits the content of some ads, including by deleting words and images, before publication. The record indicates that in some cases, these deletions likely served to remove evidence of the illegality of the underlying transaction. Specifically, as part of its moderation process, it appears that Backpage will delete particular words or images from an advertisement before posting it to the web [sic], if those words or images violate its terms of service. The Subcommittee attempted to take the testimony of two Backpage employees in charge of its moderation practices, but they refused to testify on the grounds that it might incriminate them. The Subcommittee, however, obtained evidence demonstrating that, from 2010 to 2012, when Backpage outsourced its moderation work to India, it did delete certain images, words, or phrases from “adult” advertisements. The Subcommittee’s subpoena seeks to understand whether Backpage’s current practices have the purpose or effect of removing images or text that could alert law enforcement to the nature and extent of the transaction being offered. Backpage refuses to produce that information. (Portman and McCaskill 2016)

The subcommittee’s assertion is that by editing the text or image associated with an adult classified, Backpage obfuscated classified posts that may have been directly linked to sex trafficking. By removing information from the post, law enforcement officials are not as readily able to investigate potential sex trafficking cases. Furthermore, by editing the classified advertisement, rather than simply not publishing it or reporting it to law enforcement authorities, Backpage may have aided sex traffickers.

Additionally, the subcommittee found that Backpage removed the metadata from images on its website (Portman and McCaskill 2016). Metadata in photographs often contains identifying information such as who owns the file, what camera took the photo, and keywords to make the image searchable. Removing the metadata from a file provides a layer of privacy for the owner of the file. In e-commerce sites such as Backpage or Craigslist, removing the metadata serves to protect the user from potential cybercriminals who might use that information to identify and exploit the user. Therefore, it is beneficial for Backpage’s users that the website removes the metadata. However, in a potentially illegal classified advertisement, it would be very beneficial to law enforcement for the metadata to be available for their investigations.

In March 2016, the Senate subcommittee declared Backpage in contempt of Congress. Officially designating Backpage as being in contempt is an important step toward determining Backpage’s guilt or innocence concerning its affiliation with sex trafficking. The designation of contempt allows the Senate Legal Counsel to file a lawsuit (Goldman 2016). Backpage stated that the company would welcome a lawsuit so that the courts can determine if Backpage’s practices are illegal or if the First Amendment protects the company’s current operating procedure (Goldman 2016). The courts ruled that Backpage.com was legally protected by Section 230 of the Communications Decency Act, so citizens, victim rights advocates, and policy makers demanded a change to the current laws protecting websites such as Backpage.com.

As a result of bipartisan efforts at the federal level in the United States, on April 11, 2018, President Donald Trump signed a combination of bills into law to better protect victims of online sex trafficking. The bills include the Allow States and
Victims to Fight Online Sex Trafficking Act (FOSTA) and the Stop Enabling Sex Traffickers Act (SESTA). The legislation opens more avenues for victims of online sex trafficking to legally pursue websites that facilitate trafficking by amending Section 230, making it easier for federal and state prosecutors and private citizens to go after platforms whose sites have been used by traffickers.

Technology Used Against Trafficking

Although sex traffickers and buyers are difficult to identify on the Internet, evidence of their criminal acts will become more visible as sex trafficking continues to shift into the digital world (Ibanez and Suthers 2014). Researchers and law enforcement agencies are using new technologies and various methods to identify trafficking and stem its spread. Utilizing data mining in order to collect and analyze aggregate data appears to be the most promising approach at this time. Researchers using data mining employ strategies to group, classify, and analyze data. Examining aggregated data allows patterns to emerge.

The more data that is gathered and analyzed, the more effective these investigative efforts will become. On the surface web, researchers gather data from suspected sex trafficking posts on websites and social media apps, in order to identify and analyze sex trafficking patterns. As noted above, Ibanez and Suthers (2014) tracked traffickers’ movements across the country and concluded that traffickers often travel in circuits, advertising their victims. Similarly, Hayden (2014) marked suspected traffickers’ approximate locations based on the telephone information the traffickers listed for their Backpage.com advertisements.

In 2015, Thorn, a nonprofit organization that focuses on the prevention of child sexual exploitation, launched the Spotlight program to help law enforcement officials identify and solve child sex trafficking cases. Spotlight is being used in 48 states, has helped identify more than 360 victims, and lead to the arrests of more than 60 traffickers (Thorn 2015). The program utilizes machine-learning algorithms in order to prioritize leads (Thorn 2016). Law enforcement agencies can access Spotlight for free in order to investigate sex trafficking in their area (Thorn 2016). Spotlight serves as an example of initiatives that organizations are harnessing, utilizing data mining to categorize and analyze potential sex trafficking cases.

To data mine potential sex trafficking cases on the deep web, Defense Advanced Research Projects Agency (DARPA) developed the Memex program. DARPA is an agency of the US Department of Defense whose goal is to develop greater technologies for improving national security. The name and concept behind “Memex” refers to a hypothetical device pioneered by Vannevar Bush that stores vast amounts of information and records and also possesses supplementary functions for its stored data (Shen n.d.). Memex focuses on identifying fraudulent advertisements and job postings used to lure potential victims, so traffickers can abduct them (Greeneemeier 2015). The goal of Memex is “to invent better methods for interacting with and
sharing information, so users can quickly and thoroughly organize and search subsets of information relevant to their individual interests” (Shen n.d.).

Memex will strive to meet its goals by utilizing domain-specific indexing, domain-specific search, and Department of Defense (DoD)-specified applications (Shen n.d). Sex trafficking is difficult to track in part because sex traffickers utilize temporary advertisements, as well as peer-to-peer connections, both of which reside in the deep web and, thus, are not indexed by traditional search engines (Greenemeier 2015). Researchers and law enforcement officials will be able to utilize Memex’s search capabilities to identify potential sex trafficking sources which they would have had no way of accessing on the surface web.

In addition to its search features, Memex also boasts the ability to link together data found within search results (Greenemeier 2015). When key patterns, similarities, and discoveries are detected, certain algorithms within Memex will generate a statistical score for significance. An important example is the Tika-Jaccard Similarity algorithm. This algorithm attempts to capture statistical similarities from image or video metadata, by weighing this metadata against a “golden feature set.” The golden feature set is a known set of metadata which represents sex trafficking activity. The metadata often includes exchangeable image file format (EXIF), Flash, RGB, Color Space, Camera Make, and Camera Model Serial Number. Mattman (2016) provides the following pseudocode of the Tika-Jaccard Similarity algorithm:

In the above algorithm, lines 1–2 initialize the input and output variables. Next, lines 4–6 initialize the “goldSet,” “allMetadata,” and “scores” variables as arrays to

```python
1  input: directory of files d
2  output: scores s for all files in d
3
4  goldSet:= {}
5  allMetadata:= {}
6  scores:= {}
7
8  for file in d:
9    text, metadata:= tika.parse(file)
10   goldSet:= goldSet ∪ metadata.keys
11   allMetadata[file]:= metadata
12
13  goldenSetSize:= |goldSet|
14
15  for file in allMetadata.keys:
16    overlap:=|allMetadata[file]| ∩ goldSet|
17    score:= overlap / goldenSetSize
18    scores[file]:= score
19
20  return scores
```
organize the input and output data. Lines 8–11 creates a “for loop” to gather the metadata from a known human trafficking data set. This loop will run until it has processed all the files within the data set. Line 13 sets the size of “goldSet” array, which will be used to calculate the statistical score of the suspected human trafficking data set. Lines 15–18 compare the suspected human trafficking data to the known human trafficking data. Line 20 returns the scores for each file in the suspected human trafficking data set. The researcher can then analyze the scores of the suspected human trafficking data to determine if the data set is likely to be linked to trafficking.

The data can be displayed visually in order to identify spatial and temporal maps in real time (Daire 2015). Memex is already being used to a limited extent. The New York District Attorney’s Office stated that Memex has aided over 20 active sex trafficking investigations, as well as 9 open indictments (Daire 2015). Traditional search engines merely display various search results, ranked by algorithms that prioritize the links the engine estimates will be the most helpful. Each search result is isolated to itself; there is no connection between the sources of data. Memex’s ability to link data points will present patterns that were not clear before, on both the deep web and surface web.

Although Memex is primarily being applied to sex trafficking cases at this time, its associative ability to index, organize, and link data has innumerable applications. Law enforcement agencies can utilize Memex to investigate similar crimes, such as firearm and drug trafficking (Greenemeier 2015). The domain-specific searching lends itself to investigating other major issues such as terrorism and disease tracking and response (Greenemeier 2015). Although the primary goal of Memex is to combat human trafficking, other organizations are also interested in using Memex to search and link data not related to crime at all. For example, NASA JPL is interested in utilizing Memex to catalog spacecraft data, a hefty task that is usually daunting for scientists (Churgwin 2015). Additionally, Memex also has capabilities of crawling and linking data from the surface web. One of the most important Memex utilities that perform this function is TJBatchExtractor. Specifically designed to harvest adult classifieds and female escort information from Backpage, TJBatchExtractor performs data collection and analysis on all available data across multiple advertisements. Specifically, TJBatchExtractor harvests data such as age, physical measurements, ethnicity, eye and hair color, phone numbers, and emails. The data is then linked together, and the same analyses can be performed as though the information had been gathered from the deep web.

The Memex team is creating a “dark web crawler” in order to index the dark web, the region of the Internet accessible only via Tor or peer-to-peer software (Greenemeier 2015). This is currently being accomplished by utilizing multiple web crawlers with specific guidance. The major web crawlers listed in the DARPA open catalog each serve a distinct purpose: ACHE enables focused crawling; Arachnado allows for deep crawling; Distributed Frontera integrates decision-making for logic and policies to be used when crawling; Frontera can be used when storage and priorities are needed; HSProbe (The Tor Hidden Service Prober) can extract hidden content; SourcePin assists with new website discovery (Shen n.d.).
Memex even has the capability to crawl web pages that require log-ins. Using a utility called “Autologin,” Memex can crawl any given web page of any given website, when provided with proper user credentials (Hyperion Gray 2014). Additionally, Memex also includes tools which provide machine learning, infrastructure, visualization, security, analytics, statistics, experimentation support, processing, distributed programming, and application program interface (API) (Shen n.d.). The complexity of Memex is an astounding achievement that has arisen from combating human and sex trafficking. Indexing the dark web will provide a greater understanding of the scope of activity that takes place in one of the most inaccessible parts of the Internet. While not all activity on the dark web is criminal in nature, advertisements for criminal activity do exist. Identifying locations on the dark web is a significant step toward tracking the cybercrime that is facilitated there.

The prospect of such a powerful data mining tool raises questions about the privacy of innocent users on the Internet. Data collection is one of the primary functions of Memex, and in the wrong hands, it seems as though it has the capabilities to gather sensitive user information, such as bank account information. The DARPA Open Catalogue currently lists 12 projects whose primary purpose is data collection (Shen n.d.). These data collection projects include web crawlers and tools that supplement and interpret the gathered data. Memex program manager Christopher White made a conscious decision for Memex to avoid password-protected content (Greenemeier 2015). The Memex program is not interested in “deanonymizing or attributing identity to servers or IP addresses, or accessing information not intended to be publicly available” (Shen n.d.). Significantly, the Memex project is mostly composed of open-source tools, all available on Github through the DARPA Open Catalogue (Greenemeier 2015). One of the most fascinating characteristics of the Memex program is the enormous amount of collaboration behind it. Memex has received aid from academia, government, industry, and open-source development. Some of the major contributors include the US Naval Research Laboratory, Georgetown University, Columbia University, Carnegie Mellon University, NASA Jet Propulsion Laboratories (JPL), Kitware, and Continuum Analytics (Shen n.d.). The open-source nature of the code will provide unbiased information about how the Memex team built the tools and how researchers and law enforcement agencies use those tools. The prevention of crimes such as sex trafficking is an objectively positive goal, but innocent users’ personal information need not be sacrificed in order to prevent those crimes.

**Conclusion**

The conception of the Internet has increased the scope of trafficking. Due to our interconnected world, victims can be targeted from any location around the world, traffickers can advertise to potential buyers with a sense of anonymity, and buyers can rent or buy victims from the comfort of their home. Although we know the demographics and groups traffickers target, there is dearth of prevalence data to speak to how many victims are affected by trafficking. However, traffickers will
continue to utilize technology to their advantage, and as their methods are analyzed, researchers will gain a better understanding of how to prevent trafficking.

Programs such as Spotlight and Memex will allow researchers and law enforcement agencies to organize data in new ways in order to find patterns and draw conclusions. As data is collected, and these technological approaches mature, researchers will have more evidence regarding how trafficking is conducted in the digital world. While traffickers are able to obfuscate their identities online, the tools discussed above provide an advantage to law enforcement officials in their efforts to track and prevent trafficking. Technology has initially negatively impacted anti-trafficking efforts by enhancing traffickers’ ability to recruit and sell victims for sex trafficking, but emerging programs such as those discussed in this chapter are narrowing the gap between traffickers and law enforcement responses to address the issue.

Abstract

Violent extremism is an emerging global threat instigated by extremist groups such as ISIS and Boko Haram. These organizations thrive only as a result of the consistent recruitment and indoctrination of new members. To date, preventative measures for those who are vulnerable to exploitation and recruitment have been under-researched in counterterrorism studies. More emphasis is placed on exploring the behaviors and patterns of those already identified as active participants in extremist groups. Recently, case studies have indicated parallels between the factors and patterns found in the recruitment and training of trafficking victims and the radicalization of adults and youth to these extremist causes. This chapter examines patterns currently employed by extremist enslaving groups that mirror those of human traffickers, including recruitment patterns, grooming protocols, coercive manipulation, power dynamics, and psychological coercion. Finally, it suggests gaps within and needed additions to treatment protocols and practices necessary to be developed in the counter-trafficking field that might also support treatment and practices in countering violent extremism.

**Introduction**

The intersection of human trafficking and terrorism is a continually evolving and complex co-occurring area of exploitation that cross-pollinates with many areas of organized crime such as trafficking in arms and drugs and money laundering (Kaplan 2006), as well as cybercrime, given the greater accessibility to induct and recruit individuals through the advance of technology, Internet, and social media messaging platforms (Brown and Silke 2011). The lucrative multibillion dollar shadow economy of trafficking in persons is a tool that meets several key needs of violent extremists and terrorist organizations. These range from the financing of daily operations and purchases of weaponry to the dangerous ability to reinforce narratives of fear and oppression by the use of human trafficking to target ethnic and religious minorities and systematically deteriorate the character and composition of a region and its people. Groups such as ISIS (also known as IS, ISIL, or Da’esh) and Boko Haram seek to institutionalize rape and exploitation as tools of war, terror, power, and control (Abdulazeez and Oriola 2018). The Lord’s Resistance Army (LRA), a terrorist insurgent group in Northern Uganda, have abducted more than 12,000 children to be used as child soldiers or sexually exploited and trafficked (Shelley 2010). The Hezbollah, the Taliban, and the PKK have all been known to engage in the trafficking of persons to support their activities and strengthen their criminal enterprise capacity (Shelley 2010). Extremist groups use human trafficking to diversify their income streams such as those gained from selling women, men, and children as day laborers or sexual slaves. This activity reaps substantial profits, which in turn enable them to expand their influence and to plot and fund acts of mass-targeted violence and terror. Trafficking continues to fuel and perpetuate regional conflict, which enables violent extremist organizations to operate inconspicuously and to capitalize on the conflict-related unrest and chaos to advance their agendas, while further preying upon and exploiting the individuals and communities made vulnerable as a result of the conflict and unrest. Ultimately the profits reaped from sexual exploitation of victims enable these insurgent groups such as ISIS to be more than an insurgent group – to become, in fact, a terrorist network (Clarke 2017).

To date, there is no consensus or agreed-upon definition of the terms terrorism and violent extremism; however, the Federal Bureau of Investigation’s (FBI’s) definitions will be utilized in this chapter to define domestic and international terrorism, as well as violent extremism in this way:

**International terrorism:** Perpetrated by individuals and/or groups inspired by or associated with designated foreign terrorist organizations or nations (state-sponsored):
For example, the December 2, 2015, shooting in San Bernardino, CA, that killed 14 people and wounded 22 and that had involved a married couple who had radicalized for some time prior to the attack and were inspired by multiple extremist ideologies and foreign terrorist organizations (FBI 2016).

Domestic terrorism: Perpetrated by individuals and/or groups inspired by or associated primarily with movements (within their own country) that espouse extremist ideologies of a political, religious, social, racial, or environmental nature: for example, the June 8, 2014, Las Vegas shooting, during which two police officers inside a restaurant were killed in an ambush-style attack, which was committed by a married couple who held anti-government views and who intended to use the shooting to start a revolution (FBI 2016).

Violent extremism is defined by the FBI as “encouraging, condoning, justifying, or supporting the commission of a violent act to achieve political, ideological, religious, social, or economic goals” (FBI 2016).

 Trafficking Tactics Used by Violent Extremists

Human trafficking is not only a lucrative means of financing for violent extremist groups but a key part of reinforcing extremist ideology and systemically “crushing” or “breaking down” the “enemy.” It includes tactics of torture and conflict-related sexual violence such as rape, sexual enslavement, trafficking, and reproductive coercion through forced pregnancy, forced insemination, and forced sterilization, to name a few (Malik 2016). The sexual exploitation of women, girls, and boys is also used as a way to incentivize, recruit, and retain fighters, specifically for groups such as ISIS and Boko Haram (Shelley 2010; Malik 2016). Violent extremist groups are sexually exploiting and trafficking adults, children, and vulnerable persons – from developmentally delayed individuals to marginalized groups – for profits to expand the influence and power of their network. Furthermore, they are also utilizing recruitment tactics and communication strategies similar to those of traffickers to target and compel potential fighters and individual members to join their networks. For groups like ISIS, there are available online strategies using forums, propaganda video clips, and messages that target specific individuals identified as likely to be ready for recruitment (Brown and Silke 2011), or even the “planting” of a recruiter to groom and appeal to individuals within a specific situation, forum, or group of individuals, whether in encouraging engagement in person through physical travel to the areas they occupy and operate or, from afar, carrying out “lone wolf attacks” in an individual’s city or neighboring community.

Extremist messaging strategies and digital plotting that emulates one of many tactics employed by traffickers are carried out through online grooming, often by way of a fraudulent connection, and through befriending and showing an interest through false pretenses of friendship or romantic interest and using targeted tactics to enhance commitment and dedication (Gerwehr and Daly 2006). This is a tactic
similar to that of a “Romeo Trafficker,” who recruits and exploits through these false pretenses or to cults that recruit through “love bombing,” which is a tactic often designed to influence an individual through attention and affection. The recruitment processes for terrorist organizations are also similar to cult-like behaviors in that ISIS militants and other extremist terrorist movements prey upon and exploit vulnerably isolated persons who have a lack of interpersonal relationships (Bloom and Daymon 2018). Individuals researching ISIS propaganda using social media platforms have been besieged with hundreds of friend requests, likes, comments, and/or share messages by ISIS militants. ISIS utilizes “love bombing” tactics (Bloom and Daymon 2018) that are comparable to the behaviors of religious cult leaders, sex traffickers, and pimps. When media audiences that experience symptoms of isolation and depression receive external validation from these platforms, extremists’ groups might have an easier time recruiting this demographic (Bloom and Daymon 2018).

ISIS and Boko Haram also assign new names to victims and force a victim to adopt a new persona, reassigning a new “identity” as another tool of control, breaking down and attempting to override the victim’s sense of self to enforce compliance and deeper indoctrination. This is done either upon recruitment and grooming experienced before joining the group physically, in the case of Boko Haram, or remotely in the case of ISIS. It is also done upon capture and abduction, as is the case of ISIS’s treatment of Yazidi women, whom they have brutalized, trafficked, and committed acts of genocide against. Groups like Boko Haram and ISIS also brutalize victims they abduct or recruit and justify their actions as necessary due to the victims being “nonbelievers,” shaming and blaming them through sexual violence and abuse, as do traffickers that shame and blame the victims they exploit, excusing abuse and sexual violence upon the victim through a claim that the trafficking is due to the victims’ fault (DeMarni Cromer and Cunningham 2016).

Victims of Boko Haram and ISIS also exhibit trauma bonds, a result that is evident in the 2017 negotiations between the Nigerian government and Boko Haram to release over 80 of the 200 girls abducted in 2014. Many of the girls, at surface level, appeared to “refuse” to leave their captors, but this is indicative of the level of fear, shame, potential radicalization, and, ultimately, the traumatic bond developed due to severe sexual violence and abuse experienced. This has been found to be a common occurrence with domestic and international victims of trafficking, as well (Hopper and Hidalgo 2006).

**Tactics of Trafficking, Exploitation, and Violence Used by Boko Haram**

Boko Haram is a violent extremist organization situated in sub-Saharan Africa, specifically in northeast Nigeria, as well as in Chad, Niger, and northern Cameroon (Adigun 2018; Agbiboa 2013; IMADR 2015). The rebel group was founded by Mohammed Yusuf on the principles of extremist cult-like ideologies based upon a distorted superficial understanding of Islamic religious beliefs and practices (Asfura-Heim et al. 2015; Walker 2012). The insurgency comprises a myriad of working and
migrant classes that include professionals such as college professors, bankers, security forces, and politicians, as well as children and youth (Adigun 2018; Agbiboa 2013). Boko Haram has become a destructive cult-like extremist group. It has given allegiance to ISIS and conducts mass violence on behalf of ISIS (Agbiboa 2013; Adigun 2018). Boko Haram’s grievances are based upon socioeconomic, religious, and political corruption, and its adherents blame Western society and its education for the demise of Nigerian society because, its adherents claim, the USA is representative of sin, according to Boko Haram’s extreme cult-like interpretation of the Koran (Agbiboa 2013).

Estimates show that roughly 8,000 children have been exploited by Boko Haram since 2009 (UNODC 2017). The boys abducted have been positioned as child soldiers and are being normalized to violence, whereas the girls are trafficked, as well as forced into sexual servitude, marriages, and labor trafficked for the purpose of cleaning and carrying military equipment on the front lines. There has been an increase in the trend toward both gender demographics being used as human shields in some cases, while others of those individuals are forced into becoming suicide bombers, with three-fourth of them being girls carrying out these acts (UNODC 2017). Studies have estimated that, because 50–60% of children carry HIV/AIDS in that region, their debilitating physical symptoms and stigma they carry make those children more susceptible to being targeted. Boko Haram exploits children to give themselves more publicity, as a form of self-propaganda. Girls returning home after abduction or recruitment by Boko Haram who have been raped, trafficked, and/or impregnated are then subjected to ostracization by their families, friends, and community members. This places them in an even more vulnerable position of being targeted and re-trafficked by other predators (Maiangwa and Olumuyiwa Babatunde 2015).

Boko Haram participates in mass killings and abductions, and they indenture their victims through a servitude that entraps them in rape and forced beatings, as well as in forced pregnancies and further human trafficking (Onuoha 2014; Malik 2016). The insurgency breaks down the victims’ psychological mental state and emotional well-being through forced marriages and conversions (Onuoha 2014; Malik 2016). Boko Haram then forces abductees’ family members to also convert to its extremist cult-like ideologies, and if they do not embrace these ideologies, they are threatened with murder (Malik 2016). Women and children are given new Arabic names upon their conversion and are forced to learn the Arabic language (Malik 2016). Female children are coerced or forced into marrying fighters, just as is done with adults, for the justification of their ideological misinformation and rationalization of Muslim practices (Malik 2016). The male children are converted into child soldiers forced to fight for the militia (IMADR 2015). Moreover, women are subjected to successive rapes as an outcome of the male fighters being ordered to breed in order to produce the next generation of militant combatants (Malik 2016). Victims are targeted in various ways that include incidences of terrorist infiltration at camps for internally displaced persons (IDP), particularly in one area northeast of Nigeria (Barau 2018). As similar to that of traffickers that outsource duties to other victims, such as the “bottom girls, ” these women are forced to infiltrate various social or geographical
settings to find new recruits. Additionally, a parallel recruiting technique is used in the cult world. Abductions are also a method for targeting victims for trafficking, as is the practice of manipulating their trafficking victims with threats and the use of JuJu, also referred to as voodoo magic (Ikeora 2016; IMADR 2015). Trafficked women of Boko Haram are made to take “oaths of secrecy”; by serving the militia, they must repay their debt, if they have any, and they are required to commit to never telling the authorities of their oath (Ikeora 2016; IMADR 2015) – an effective psychological and ritual abuse tactic that continues to plague many victims of gender-based violence and trafficking under Boko Haram.

**Tactics of Exploitation and Violence Used by ISIS**

ISIS, a group name that stands for the Islamic State of Iraq and the Levant, has its original roots from Al Qaeda and has, since its inception, been identified with various names and/or titles by Western media, US government entities, and international tribunal organizations; these labels include ISIS – the Islamic State – and also ISIS, the Islamic State of Iraq and Syria (UNODC 2017). This militia is supposedly composed of Sunni Muslims; their grievances are against the West, and they promote sectarian violence (Malik 2016). As with Boko Haram, their goal is to enforce Sharia law, as ruled by a caliphate (Bloom and Daymon 2018; Malik 2016).

There tactics of abuse and violence mirror those of Boko Haram. ISIS places heavy emphasis on and has an obsessive preoccupation with nonbelievers that is known as the concept of Kuffar; through this lens of labeling, they justify abusive and dehumanizing acts of sexual violence and harm to anyone, especially women or minority ethnic groups such as the Yazidis. As a part of this depersonalizing process, they also change the names of female victims they are exploiting and trafficking – once they are captured, purchased, or recruited – and force their conversion to the process of addressing the “nonbeliever” (Malik 2016). ISIS claims that pregnant women are, in their group’s process, not allowed to be sold and that beatings are allowed only for the purposes of discipline; however, obstruction of the face – with veiling, for instance – is forbidden. Sexual intercourse with recruited or enslaved persons is permitted upon the purchase of a trafficked person, with the exception to that permission being intercourse with those who are virgins. ISIS members must abstain from having sex with these victims until they have had their first menstrual period in captivity, in a restriction that is understood as allowing for the purifying of the uterus and that guarantees certainty that the victim is not caring a child. ISIS abuses perpetrated against Yazidi women who were violently brutalized included chronic and consistent rape by one or multiple fighters and subjection to sex trafficking, as well as to indentured sexual servitude, severe beatings, torture, forced nudity, and forced impregnation, as well as forced conversions and constant humiliation sexually, psychologically, and physically. Victims are also forced to separate from their families (Malik 2016). Strategic and normalized sexual violence and trafficking is used by ISIS to subordinate and humiliate the “other” or the “enemy”
Restorative Treatment Needs and Gaps

The heinous violence and torture experienced by victims trafficked at the hands of violent extremist groups result in severe psychological trauma and grave health implications. Distinct clinical care similar to that of the treatment of torture trauma would be an appropriate clinical standard of care with which to norm and tailor the required psychological trauma care and comprehensive medical treatment. The implementation of a multidisciplinary, culturally intelligent approach would be crucial to the healing and reintegration of these survivors. Community-based practices must be established to reduce the shame and stigmatization of survivors and encourage healing and reintegration, through the use of cultural healing rituals and culturally appropriate therapeutic trauma modalities, as well as comprehensive psychosocial, medical, legal, vocational, and educational support. Additionally, collaboration with and support of key community leaders should be instituted for the purpose of reframing the narrative of shame and blame that burdens survivors, and actions taken toward accepting the survivor back into the community is imperative. Currently, there are no standards of care established for victims of human trafficking, and an inconsistent array of modalities and practices are utilized in diverse settings. Many best practices inconsistently applied reinforce the blaming and shaming and, thus, the re-traumatization of survivors of trafficking by the community and its various systems of support. It is essential, at a minimum, that a comprehensive clinical, medical, cross-cultural, and legal framework be established for such survivors of trafficking, specifically for survivors trafficked by extremist groups. Establishing specialized working groups can begin to highlight for the community and its caregivers the intersection of trafficking and terrorism, which intersection is an under-researched and poorly documented human rights crime (Malik 2016).

Abstract

Human trafficking should encompass organ trafficking. However, there is resistance to that inclusion. This chapter sets out that resistance and suggests ways in which it can be overcome.

Keywords

Organ and human trafficking · Transplant abuse

Does the Protocol on Trafficking in Persons of the Convention on Transnational Organized Crime encompass transplant tourism? The answer this chapter gives to that question is yes. Getting to that answer takes some explaining.

Though the question is general, the approach here comes from a particular perspective. A report in June 2006 under the name Bloody Harvest concluded that prisoners of conscience in China, practitioners of the spiritually based set of exercises Falun Gong, were being killed for their organs which were being sold at high prices to transplant patients, mostly transplant tourists. A second version in of the report was published in January 2007 and a third version in book form came out under the title Bloody Harvest in November 2009. The report prompted the founding of a nongovernmental organization Doctors Against Forced Organ

Harvesting or DAFOH. A coedited book of essays on organ transplant abuse in China was published in August 2012 under the name *State Organs*. Ethan Gutmann, in research with Jaya Gibson, announced in June 2010, and, in a book titled *The Slaughter* published in August 2014, wrote that the killing of innocents for their organs had spread from Falun Gong to Tibetans, Eastern Lightning house Christians, and Uighurs.

Falun Gong is a set of exercises with a spiritual foundation begun in 1992 with the teachings of Li Hongzhi. It was initially encouraged by the Communist Party of China as beneficial to health. However, its increasing popularity led the Party, out of jealousy and fear for its ideological supremacy, to ban the practice and to insist that the practitioners recant. Those who did not recant were tortured. Those who did not recant after torture disappeared. The disappeared, in the hundreds of thousands, became a vast forced organ donor bank. Transplant tourism into China became a billion dollar business (Matas and Kilgour 2009).

After the 2006 report *Bloody Harvest* was published, the Government of China changed its organ transplant system to give a priority to nationals over foreigners. A number of countries changed their laws and policies in ways that penalized or discouraged transplant tourism into China. The flow of transplant tourists into China diminished but did not stop.

Until May 2014, the Omar Healthcare Service website promoted transplant tourism into Tianjin, China. The website was taken down only after a public protest letter by The Transplantation Society in February 2014. The 21st Report of the Malaysian Dialysis and Transplant Registry 2013 sets out in Chap. 13, Renal Transplantation, that there were nine Malaysian patients who obtained transplants in China in that year (Matas and Trey 2012).

A delegation from DAFOH met in Geneva Monday, December 9, 2013, with the Office of the United Nations High Commissioner for Human Rights to present a petition with nearly 1.5 million signatures from 53 countries and regions asking the High Commissioner Mme Navi Pillay to:

1. Call upon Government of China to end immediately the forced organ harvesting from Falun Gong prisoners
2. Initiate an investigation which can lead to the prosecution of the perpetrators of this crime against humanity
3. Call upon the Government of China government to end immediately the brutal persecution of Falun Gong

One of the people in the Office of the High Commissioner with whom the delegation met suggested they contact the United Nations Office of Drugs and Crime (UNODC) in Vienna. The delegation followed up on that suggestion on January 1, 2014, by contacting Mirella Dummar Frahi, Civil Affairs Officer, Advocacy Section, UNODC, in Vienna, asking for a meeting on March 21 (Matas 2014).

Mirella Frahi wrote back on January 30 confirming the requested meeting. She wrote:
I am pleased to confirm that it will be possible to arrange a meeting with UNODC on Friday 21st March. Please indicate your preferred time and the name of the people accompanying you. Thank you of your interest and kind regards,

An e-mail was sent back to Ms. Frahi on January 31 indicating who would attend the meeting and the preferred time. Included were an international lawyer for DAFOH from Spain and a delegation of four, one lawyer and three doctors, from the Taiwan Association for International Care of Organ transplants (TAICOT). After tickets had been booked, on March 4, 2014, over a month after the initial confirmation, Mirella Frahi wrote back saying:

With reference to your request for meetings on 21 March 2014, I regret to inform you that owing to our forthcoming major Commission meeting on Narcotic Drugs from 13–21 March that it will be challenging for us to tie down a convenient time to meet. I would suggest that we take contact following the Commission meeting on this issue.

A follow up e-mail March 12 from the delegation stated:

Our group will be in Vienna next week Thursday and Friday March 20 and 21 and would be available to meet on short notice.

On March 13, this message from the Asian delegation was forwarded Ms. Frahi:

Please let them know we delegation from Asia already finalized our air ticket and lodging in Vienna for this meeting, it will be improper to cancel this meeting by such short notice.

These e-mails prompted a response from an unnamed superior of Ms. Frahi who wrote on March 14:

Unfortunately, as Ms. Dummar Frahi has indicated previously, she will not have the time to meet with you and the Asian delegation.

Having already booked tickets, the delegation all came to Vienna. The TAICOT group went to the offices of UNODC on March 21 and attempted on the spot to meet with relevant officials. This effort prompted a response the same day from Mr. Ilias Chatzis, Chief, Human Trafficking and Migrant Smuggling Section, Organized Crime and Illicit Trafficking Branch, United Nations Office on Drugs & Crime, Vienna. He wrote:

I would like to thank you for your message and for the interest in our work. I understand that you have been trying to reach me today. However, I had no earlier knowledge of your presence in Vienna nor of the issues you wanted to discuss with me. A meeting would also not be productive as my Section’s work does not include what you refer to as organ harvesting nor the other issues covered in your e-mail. My Section covers the UNTOC Protocols on Trafficking in Human Beings and on Migrant Smuggling. I am sorry that I cannot be more helpful at this stage.

Well, that seemed pretty straightforward. Nonetheless, clarification was sought from the person in charge.
An e-mail was sent to Yury Fedotov, Executive Director UN Office of Drugs and Crime Vienna, Austria, on July 30 asking for clarification. The e-mail stated:

As a result of the exchange of e-mail attached between Mr. Ilias Chatzis, Chief, Human Trafficking and Migrant Smuggling Section, Organized Crime and Illicit Trafficking Branch, United Nations Office on Drugs & Crime and Dr. Alex Chih-Yu Chen, International Liaison Officer, Taiwan Association for International Care of Organ Transplants, which has been drawn to my attention, I request from the UN Office of Drugs and Crime a clarification. Does the Office a) take the position that transplant tourism and the sourcing of organs from non-consenting persons for sale are subject matters that
i) fall within the scope of the Protocol on Trafficking in Persons to the Convention on Transnational Organized Crime or
ii) do not fall within the scope of the Protocol or
b) take no position on these matters?

On August 8, 2014, on behalf of Mr. Fedotov, Mr. Tofik Murshudlu, Officer in Charge, Organized Crime and Illicit Trafficking Branch, Division for Treaty Affairs, United Nations Office on Drugs and Crime responded by quoting extensively from the Protocol but saying nothing more. He wrote:

I refer to your email to Mr. Yury Fedotov on 28 July 2014. Our leading instrument is indeed the Trafficking in Persons Protocol to the Organized Crime Convention. According to Article 3 (a) of that Protocol,
‘... ‘trafficking in persons’ shall mean the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation.

Exploitation shall include, at a minimum, ... the removal of organs’.

The Protocol also requires, in Article 5 (1), that each State Party shall adopt such legislative and other measures as may be necessary to establish as criminal offences the conduct set forth in article 3 of this Protocol, when committed intentionally.

Therefore, conduct that fulfils this three-pronged definition is considered trafficking in persons for the purpose of organ removal.

As for consent, the Trafficking in Persons Protocol actually says in Article 3 (b) that ...the consent of a victim of trafficking in persons to the intended exploitation set forth in subparagraph (a) of this article shall be irrelevant where any of the means set forth in subparagraph (a) have been used.

For children, that is persons under the age of 18, consent is actually always irrelevant.

That, of course, amounted to a lot of words saying nothing. So the original question remained.

The United Nations of Office on Drugs and Crime website has this entry:

... demand for organs has outstripped supply, creating an underground market for illicitly obtained organs.
Desperate situations of both recipients and donors create an avenue ready for exploitation by international organ trafficking syndicates. Traffickers exploit the desperation of donors to improve the economic situation of themselves and their families, and they exploit the desperation of recipients who may have few other options to improve or prolong their lives. . . . One factor that is distinct in this form of trafficking in persons is the profile of culprits; while some may live solely from criminal trafficking activities, others may be doctors, nurses, ambulance drivers and health care professionals who are involved in legitimate activities when they are not participating in trafficking in persons for the purpose of organ removal.

. . . The Trafficking in Persons Protocol supplementing the Transnational Organized Crime Convention includes trafficking in persons for the purpose of organ removal.

UNODC response

Trafficking in persons for the purpose of organ removal was on the agenda of the Working Group on Trafficking in Persons established by the Conference of Parties to the Organized Crime Convention at its fourth session, from 10 to 12 October 2011.

The Working Group recommended that States parties to the Convention should encourage relevant United Nations entities, including UNODC, to gather evidence-based data on trafficking in persons for the purpose of organ removal, including root causes, trends and modus operandi, with the aim of facilitating better understanding and awareness of the phenomenon while recognizing the difference between trafficking in organs, tissues and cells.

The Working Group also requested UNODC to develop a training module against trafficking in persons for the purpose of organ removal, and provide technical assistance, especially in regard to investigation, exchange of information and international legal cooperation.

It has been suggested that there is need for an international treaty banning transplant tourism (Matas 2014). It may be simpler, as the UNODC website suggests, just to make better use of the Trafficking in Persons Protocol to the Transnational Organized Crime Convention.

The Global Report on Trafficking in Persons 2012 published by the UN Office on Drugs and Crime states

Organ trafficking is not classified as human trafficking. For an act to be considered trafficking in persons, a living person has to be recruited by means of force or deception for the exploitative purpose of removing an organ. There is a large grey area between licit organ donations and the trafficking of persons for organ removal.

Within this “gray area” could be included the killing of prisoners of conscience for their organs to be sold at high prices to transplant patients as human trafficking.

In answering the question whether there is need for a new treaty or whether the existing treaty can be applied to transplant tourism, the experience of the Council of Europe is instructive. The Council of Europe had a Convention on Action against Trafficking in Human Beings dating from 2005 which applied to trafficking in organs. The Convention defined “Trafficking in human beings” to mean:

the recruitment, transportation, transfer, harbouring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the
abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, . . . the removal of organs;

The language of that Convention is identical to the UN Protocol. The Council of Europe, despite that Convention, saw fit to approve yet another Convention titled the Convention against Trafficking in Human Organs, opened for signature July 2014. That Convention can be signed by the member States of the Council of Europe, the European Union, and the nonmember States which enjoy observer status with the Council of Europe. It is also can be signed by any other nonmember State of the Council of Europe upon invitation by the Committee of Ministers.

The existence of this second Council of Europe Convention raises three questions. One is whether there is a need to replicate the second Council of Europe Convention at the United Nations. If the Council of Europe felt the need for a more specific Convention directed specifically to organ trafficking despite an existing Convention on human trafficking which encompassed organ trafficking, should not the UN also have the same need?

Second, why is there even need for a UN Convention on organ trafficking when the Council of Europe Convention is open for signature by all states? Would it not be simpler just to urge states to sign on to the Council of Europe Convention?

Third, do any of these Conventions now encompass transplant tourism? Is it necessary to have a third Council of Europe Convention and another UN Protocol or treaty to address specifically transplant tourism?

To a certain extent, these questions are bound up with a larger question which bedevils international treaty negotiation. Some argue that the international community is better off with a focus on implementation rather than instrument proliferation (Matas 1994). Others argue that a wide variety of specific new international instruments provides detail. States which may refrain from signing on to one treaty may be willing to sign on to another similar, but not identical, overlapping treaty. NGOs may be more mobilized to advocate adherence to a specific treaty which coincides with their priorities than to a general treaty which encompasses their priorities as only one among many matters.

The answer to the first question, why a second Council of Europe Convention, is, to a certain extent, answered by the preamble to the second Convention. One preambular paragraph states:

Determined to contribute in a significant manner to the eradication of the trafficking in human organs through the introduction of new offences supplementing the existing international legal instruments in the field of trafficking in human beings for the purpose of the removal of organs;

The first Convention states simply in Article 18:

Each Party shall adopt such legislative and other measures as may be necessary to establish as criminal offences the conduct contained in article 4 of this Convention, when committed intentionally.
Article 4 contains the definition of trafficking, which included organ trafficking. This provision is similar to a provision in the UN Protocol. The Protocol states:

**Article 5**
1. Each State Party shall adopt such legislative and other measures as may be necessary to establish as criminal offences the conduct set forth in article 3 of this Protocol, when committed intentionally.

The second Council of Europe Convention is far more specific. The specific penalty provisions are set out below:

**Article 4 - Illicit removal of human organs**
1. Each Party shall take the necessary legislative and other measures to establish as a criminal offence under its domestic law, when committed intentionally, the removal of human organs from living or deceased donors:
   a. where the removal is performed without the free, informed and specific consent of the living or deceased donor, or, in the case of the deceased donor, without the removal being authorised under its domestic law;
   b. where, in exchange for the removal of organs, the living donor, or a third party, has been offered or has received a financial gain or comparable advantage;
   c. where in exchange for the removal of organs from a deceased donor, a third party has been offered or has received a financial gain or comparable advantage.
2. Any State or the European Union may, at the time of signature or when depositing its instrument of ratification, acceptance or approval, by a declaration addressed to the Secretary General of the Council of Europe, declare that it reserves the right not to apply paragraph 1.a of this article to the removal of human organs from living donors, in exceptional cases and in accordance with appropriate safeguards or consent provisions under its domestic law. Any reservation made under this paragraph shall contain a brief statement of the relevant domestic law.
3. The expression 'financial gain or comparable advantage' shall, for the purpose of paragraph 1, b and c, not include compensation for loss of earnings and any other justifiable expenses caused by the removal or by the related medical examinations, or compensation in case of damage which is not inherent to the removal of organs.
4. Each Party shall consider taking the necessary legislative or other measures to establish as a criminal offence under its domestic law the removal of human organs from living or deceased donors where the removal is performed outside of the framework of its domestic transplantation system, or where the removal is performed in breach of essential principles of national transplantation laws or rules. If a Party establishes criminal offences in accordance with this provision, it shall endeavour to apply also Articles 9 to 22 to such offences.

**Article 5 - Use of illicitly removed organs for purposes of implantation or other purposes than implantation**
Each Party shall take the necessary legislative and other measures to establish as a criminal offence under its domestic law, when committed intentionally, the use of illicitly removed organs, as described in Article 4, paragraph 1, for purposes of implantation or other purposes than implantation.

**Article 6 - Implantation of organs outside of the domestic transplantation system or in breach of essential principles of national transplantation law**
Each Party shall consider taking the necessary legislative or other measures to establish as a criminal offence under its domestic law, when committed intentionally, the implantation of human organs from living or deceased donors where the implantation is performed...
outside of the framework of its domestic transplantation system, or where the implantation is performed in breach of essential principles of national transplantation laws or rules. If a Party establishes criminal offences in accordance with this provision, it shall endeavour to apply also Articles 9 to 22 to such offences.

Article 7 - Illicit solicitation, recruitment, offering and requesting of undue advantages
1. Each Party shall take the necessary legislative and other measures to establish as a criminal offence under its domestic law, when committed intentionally, the solicitation and recruitment of an organ donor or a recipient, where carried out for financial gain or comparable advantage for the person soliciting or recruiting, or for a third party.
2. Each Party shall take the necessary legislative and other measures to establish as a criminal offence, when committed intentionally, the promising, offering or giving by any person, directly or indirectly, of any undue advantage to healthcare professionals, its public officials or persons who direct or work for private sector entities, in any capacity, with a view to having a removal or implantation of a human organ performed or facilitated, where such removal or implantation takes place under the circumstances described in Article 4, paragraph 1, or Article 5 and where appropriate Article 4, paragraph 4 or Article 6.
3. Each Party shall take the necessary legislative and other measures to establish as a criminal offence, when committed intentionally, the request or receipt by healthcare professionals, its public officials or persons who direct or work for private sector entities, in any capacity, of any undue advantage with a view to performing or facilitating the performance of a removal or implantation of a human organ, where such removal or implantation takes place under the circumstances described in Article 4, paragraph 1 or Article 5 and where appropriate Article 4, paragraph 4 or Article 6.

Article 8 - Preparation, preservation, storage, transportation, transfer, receipt, import and export of illicitly removed human organs
Each Party shall take the necessary legislative and other measures to establish as a criminal offence under its domestic law, when committed intentionally:

a. the preparation, preservation, and storage of illicitly removed human organs as described in Article 4, paragraph 1, and where appropriate Article 4, paragraph 4;
b. the transportation, transfer, receipt, import and export of illicitly removed human organs as described in Article 4, paragraph 1, and where appropriate Article 4, paragraph 4.

Also worthy of note are the jurisdictional provisions. The first Council of Europe Convention provides:

Article 31 - Jurisdiction
1 Each Party shall adopt such legislative and other measures as may be necessary to establish jurisdiction over any offence established in accordance with this Convention, when the offence is committed:

c. by one of its nationals or by a stateless person who has his or her habitual residence in its territory, if the offence is punishable under criminal law where it was committed or if the offence is committed outside the territorial jurisdiction of any State;

The second Council of Europe Convention provides:

Article 10 - Jurisdiction
1 Each Party shall take such legislative or other measures as may be necessary to establish jurisdiction over any offence established in accordance with this Convention, when the offence is committed:
d. by one of its nationals; or  
e. by a person who has his or her habitual residence in its territory.

4 For the prosecution of the offences established in accordance with this Convention, each Party shall take the necessary legislative or other measures to ensure that its jurisdiction as regards paragraphs 1. d and e of this article is not subordinated to the condition that the prosecution can only be initiated following a report from the victim or the laying of information by the State of the place where the offence was committed.

Both Council of Europe Conventions address specifically extraterritoriality. Both Council of Europe Conventions though limit extraterritoriality to nationals and habitual residents. They do not require assertion of jurisdiction over visitors who have committed the offences abroad.

The UN Protocol does not address jurisdiction but rather incorporates the UN Convention provisions on jurisdiction. The Protocol states:

Article 1  
Relation with the United Nations Convention against Transnational Organized Crime  
1. This Protocol supplements the United Nations Convention against Transnational Organized Crime. It shall be interpreted together with the Convention.  
2. The provisions of the Convention shall apply, mutatis mutandis, to this Protocol unless otherwise provided herein.

The United Nations Convention against Transnational Organized Crime provides:

Article 15  
Jurisdiction  
2. Subject to article 4 of this Convention, a State Party may also establish its jurisdiction over any such offence when:

(b) The offence is committed by a national of that State Party or a stateless person who has his or her habitual residence in its territory;

On extraterritoriality, the UN Convention and Protocol are then different from the two Council of Europe Conventions. The Council of Europe Conventions requires it, using the word “shall.” The UN Convention and Protocol allow it but do not require it, using the word “may.”

There is one other piece in this puzzle, the definition of transplant tourism. The Declaration of Istanbul on Organ Trafficking and Transplant Tourism defines transplant tourism to be travel for transplantation which

involves organ trafficking and/or transplant commercialism or if the resources (organs, professionals and transplant centers) devoted to providing transplants to patients from outside a country undermine the country's ability to provide transplant services for its own population.

With this background and a focus on China in mind, the three questions posed earlier should be considered: first, whether the Council of Europe Conventions are
sufficient or a UN Convention is necessary, second whether the existing UN Protocol will do, and thirdly, whether the existing instruments encompass transplant tourism.

The answer to the third question is straightforward. It may well be that not every aspect of transplant tourism is encompassed by the two Council of Europe Conventions and the UN Protocol. Nonetheless, all these instruments encompass travel for transplantation which involves the purchase of an organ sourced from a prisoner of conscience killed for the organ.

The answers to the first two questions present competing considerations. China is a party to the Trafficking in Persons Protocol to the Transnational Organized Crime Convention but with the reservation that it is not bound by paragraph 2 of Article 15 of the Protocol. Paragraph 2 of Article 15 of the Protocol provides:

Any dispute between two or more States Parties concerning the interpretation or application of this Protocol that cannot be settled through negotiation within a reasonable time shall, at the request of one of those States Parties, be submitted to arbitration. If, six months after the date of the request for arbitration, those States Parties are unable to agree on the organization of the arbitration, any one of those States Parties may refer the dispute to the International Court of Justice by request in accordance with the Statute of the Court.

Just relying on the UN Protocol, rather than the Council of Europe Conventions or a new UN Convention, has both the advantage and disadvantage of working with an existing instrument to which the China is a party, albeit with a reservation. The Government of China has shown no interest in ratifying the second Council of Europe Convention and presumably, while the current abuse continues, would not ratify a new UN Convention similar to the second Council of Europe Convention.

The Government of China, one should not be surprised, does not acknowledge its institutions kill prisoners of conscience for their organs, although there has been some leaked internal debate within the Communist Party, at the time of the deposition of Bo Xilai, whether to admit the abuse and pin the blame on him. The Government of China though does admit that prisoners are sources of organs (Matas 2015). The Government of China claims that all the prisoners sourced for their organs have been sentenced to death. Falun Gong in detention are mostly not convicted of anything or, if convicted at all, are punished for the vague offense of disrupting social order which is not a death penalty offense.

In any case, sourcing of organs from prisoners sentenced to death is a violation of medical ethics. Both The Transplantation Society and the World Medical Association have concluded that the coercive situation in which a person sentenced to death finds himself means that true voluntariness is not possible.

Selling organs of prisoners to transplant tourists, no matter what the sentence of the prisoners or why they are being held in detention, violates international standards, something the Government of China would likely acknowledge (Matas 2015). The response of the Government of China to the abuse characterized this way is that eventually it will cease as China shifts to an organ donation system.
This response is problematic for several reasons. Abuse should not end sometime in the indefinite future. It should end now.

Second, the Government of China response comes without disclosure consistent with international standards of transparency, traceability, and accountability about what is actually happening. The Government of China should make original data available of sources and volumes of transplants rather than, as now, uttering a sequence of mutually inconsistent political pronouncements on the matter.

Third the Government of China asserts that prisoners should be free to donate their organs, including prisoners sentenced to death, and that the Government will in the future include prisoner sourcing among its voluntary donation statistics. These assertions undermine the claim of a shift from prisoners to voluntary donors as sources for organs.

The Government of China, in sum, is so steeped in abuse today and so prone to engage in abuse for the indefinite future that it is unlikely to sign on either to the second Council of Europe Convention or any new UN instrument (Matas et al. 2016). It is moreover probable that the Government of China will contest any interpretation of the current UN Protocol which brings under the jurisdiction of the UN Office on Drugs and Crime the transplant misbehavior of the Chinese Government.

A focus on the UN Protocol has the potential advantage of joining directly with Government of China the issue of transplant abuse in China. It has the disadvantage of stalling progress because the international community gets mired in this debate with China. Alternatively, given the geopolitical weight of China and a desire not to annoy its Government, the international community may make every effort to avoid a confrontation with the Government of China by avoiding the issue.

The run around the delegation got from the UN Office when simply attempting to arrange an appointment to discuss the matter, as well as the initial statement from the Human Trafficking section of the UN Office for Drugs and Crime that their “work does not include” addressing the sale to transplant tourists of organs sourced from prisoners of conscience may not have been influenced by the Government of China either directly or through fears of what that Government might think (Matas 2014). Nonetheless, this sort of behavior is not a good sign.

The UN Protocol only allows extraterritoriality; the Council of Europe Conventions requires it. A national or habitual resident of a signatory to one of the Council of Europe Conventions who has engaged in organ brokerage in China must be prosecuted in the signatory state. A national of a signatory to the UN Protocol who has engaged in organ brokerage in China may be but does not have to be, according to the UN Protocol, prosecuted in the signatory state. The UN Protocol though is not an obstacle to extraterritoriality, even for an assertion of jurisdiction for nonnationals of the signatory state (Matas 2014).

The advantage of a focus on the existing Council of Europe Conventions and the drafting of a new UN Convention is that the Government of China is left on the sidelines. The problem of transplant tourism into China, after all, is not just a problem of insiders, those in China, but also a problem of outsiders, those coming into China (Matas and Kilgour 2009). The problem of outsiders, those travelling to
China for transplants, can be addressed directly without Government of China interference, by a focus on the existing Council of Europe Conventions and the drafting of a new UN Convention.

Addressing transplant abuse in China has to be the number one priority of the global community concerned about the transnational crime of organ trafficking. Nowhere other than China is the state apparatus actively engaged in transplant abuse. Nowhere other in China are the numbers of cases of transplant abuse so large. Nowhere other than China is cover-up so systematic, the rejection of transparency so methodical. Nowhere other than China are prisoners of conscience killed for their organs.

There is not an either/or choice. Several options can be pursued simultaneously. One option is the UN Protocol. Ultimately, UN officials who staff implementation of a treaty take their direction from states parties. It certainly would be simpler and quicker if UN officials came around on their own, without the need to obtain a direction from states parties. Nonetheless, once states parties give this direction, UN officials would have no choice. There could and should be, at the next conference of states parties, if there is no movement from UN officials on this issue by then, a resolution stating unequivocally that the current Protocol applies to the sale to transplant tourists of organs sourced from prisoners.

Conclusion

The course of action suggested, in sum, is this:

1. Continue to request that the United Nations Office of Drugs and Crime include organ transplant tourism within its work on organ trafficking
2. Propose to state parties to the UN Protocol that at the next conference of state parties, they endorse a resolution that organ transplant tourism is included within the terms of the Protocol
3. Urge all states to adhere to the second Council of Europe Convention
4. Advocate the drafting of a UN Convention along the lines of the second Council of Europe Convention

Abstract

This chapter examines the concept of child/forced marriages in the context of human trafficking for labor and sex. Empirical evidence suggests that most of the marriages that end up as forced marriages and may fall within the definition of human trafficking enterprise often begin as child marriages – where one (or both) of the partners (generally the female) is underage. It examines child/forced/servile marriages to determine whether such marriages fall within the definitions and measures set by the key treaties forming the international legal framework on human trafficking and slavery and whether they measure up to the confines set by the 1926 Slavery Convention and cover the subjection of individuals to force, coercion, control, ownership, and/or exploitation. Next the chapter discusses the dynamics of forced marriages which in essence are imbedded in the social fabric of many cultures. Then the chapter discusses how these cultural, economic, and structural factors facilitate perpetuation of such practices despite local and international laws prohibiting it. The chapter concludes with suggestions for controlling and preventing these practices.

Introduction

Forced marriage is a lived global reality affecting millions of children and adults in all regions of the world today. For millions of girls and women worldwide, marriage is not a celebration of the union between two consenting adults; rather it is an imposed decision that often results in servitude, exploitation, and denial of basic human rights (Greene 2014). Often marriages consummated under duress operate as a shield behind which slavery or even trafficking occurs with apparent impunity (Turner 2013). Some of the estimates provided by the UNICEF Annual Report (2013) reveal that, globally, almost 400 million women currently aged 20–49 were married or entered into a union when they were under 18 years old. This equates to 41% of the total population of women in this age range. Many of these marriages involved children much younger than 16 years old. Approximately 23 million (or 11%) of young women aged 20–24 years old entered into marriage or a similar union before reaching the age of 15, and some were under 10 years old on marrying. Anti-Slavery International’s analysis of data and literature review on forced marriages maintain that a sizeable proportion of the children, mainly girls, featured in the reports and articles studied tended to be much younger than 18 years old. Many were under 14 years of age when they married. A few were even younger, with examples of girls who were 7 and even 5 years old when they were married or betrothed (National Geographic 2011). According to a report issued by the Fight Slavery Now Organization (2012), “sixty million girls around the world have been forced into marriage before the age of 18, a number that grows by 25,000 child brides every day. 
Tragically, 1 in 7 girls in developing countries is married by age 15 – often to a man twice her age or older.” In some cultures, girls getting married between the ages of 5 and 10 years is the norm such as in the North and South of Ethiopia (Somerset 2000). Although forced marriage is not a new phenomenon and for a very long time forced marriages have been part of almost all cultures, it is only recently that the issue of forced marriages has received more attention. Such marriages are becoming a rapidly growing transnational crime that exploits young women and children for sex and labor (Kakar 2016). It is a social evil threatening the freedom, safety, health, and education of many women and girls. Forced marriages are prevalent in almost all cultures across the globe. According to the United States Department of State (2010), forced marriages are not limited to any one part of the globe. Rather they are “a global phenomenon engendered by cultural and societal norms about the institution of marriage and the roles of spouses.” The report defines forced marriage as the one that is “entered into without full consent and under duress, where the individual has no right to choose a partner or ability to say no.”

The same report demonstrates that in many cultures, parents and families use marriages as means to many ends. They use physical, psychological, or emotional blackmail tactics to force or coerce their daughters to marry older men, and they see these marriages as means of enriching themselves and upgrading their status in their community (Kakar 2016). Evans (2015) argues that contrary to common belief that forced marriage is the “problem with migrants,” or a characteristic of particular religion, or country, the problem of forced marriage is actually a multifaceted and multilayered problem involving law, politics, and international relations. There is empirical evidence suggesting that such marriages are not a thing of the past; rather they persist even today and are as much part of social fabric as in ancient times despite changes in laws and international outcry against such practices (Kakar 2016).

What Is Marriage?

Under international law, several treaties and declarations explicate what marriage should be and clarify the individual right to marry and found a family. These treaties and laws, in general, define marriage as a union entered into with the free and full consent of two intending adults without any force or coercion. These treaties also underscore that such consent must be expressed by the intending adults in person in the presence of the [competent] authority. Thus, in a nutshell, for any marriage to be valid and legal, it has to be entered with free and full consent of the two individuals of age intending to get married and such consent must be witnessed by the competent authority. Some of these laws and treaties are listed below:

The Universal Declaration of Human Rights 1948: Article 16:

1. Men and women of full age […] have the right to marry and found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution.
2. Marriage shall be entered into only with the free and full consent of the intending spouses.
Convention on Consent to Marriage, Minimum Age for Marriage and Registration of Marriages 1964

Article 1: (1) No marriage shall be legally entered into without the full and free consent of both parties, such consent to be expressed by them in person in the presence of the [competent] authority [...] as prescribed by law. [...] 

Article 3: All marriages shall be registered in an appropriate official register by the competent authority.

International Covenant on Civil and Political Rights 1966

Article 23:

3. No marriage shall be legally entered into without the full and free consent of the intending spouses.

International Covenant on Economic Social and Cultural Rights 1966

Article 10 mandates [...] Marriage must be entered into with the free consent of the intending spouses.

Article 16 of International Covenant on Economic Social and Cultural Rights 1966 
mandates States Parties to ensure that the betrothal and the marriage of a child shall have no legal effect.

American Convention on Human Rights 1969

Article 17 mandates “No marriage shall be entered into without the free and full consent of the intending spouses”.

Points to be noted that in all the laws and treaties listed above mandate that a legal and valid marriage must be:

1. Between two consenting adults of full age.
2. Both adults intending to marry must give free and full consent.
3. Their consent must be witnessed by a competent legal authority.
4. All marriages must be registered in an appropriate official register by the competent authority.

Thus, any marriage that falls short of these fundamental elements falls under the confines of slavery, trafficking, and servitude and is deemed forced/servile. However, there are other circumstances under which laws of the land are defunct and child marriages may take place because religious, cultural, and social customs allow such marriages with parental and/or judicial consent. This is discussed below.

Forced Marriage and Child Marriage: Similarities

What Is Child/Early Marriage?

Child marriage can fundamentally be considered a subset of forced marriage, while forced marriage also encompasses adult unions (Anitha and Gill 2009). Under most countries’ laws, a child is an individual under the age of 18 for the purpose of
marriage. However, many countries allow marriages at earlier ages with parental consent. For example, despite the fact that the legal minimum age of marriage is 18 years old in England, Wales, and Northern Ireland, there is provision for marriage with parental consent between the ages of 16 and 18 (also see https://www.girlsnotbrides.org/child-marriage/united-kingdom/). Other countries also have such provisions. In Guatemala, 14 is the legal minimum marriageable age with parental consent, while Yemen has no legal minimum age for marriage. In the United States, child marriage still happens, despite laws prohibiting such marriages and declaring any marriage before the age of 18 illegal. For example, according to the report by Reiss Fraidy (2015) (also see https://www.globalcitizen.org/en/content/child-marriage-brides-india-niger-syria/), between 1995 and 2012 in New Jersey, 3481 children were married mostly with parental consent between the ages of 16 and 17, while 163 marriages were approved by judges for children between ages 13 and 15. Ninety-one percent of these marriages were between a child and an adult.

Article 1 of the UN’s Convention on the Rights of the Child (1989) defines a child as anyone under 18 years of age. In most countries, formal legal age for marriage is 18 years, although practices may vary and deviate from the set formal legal age. The United Nations’ Universal Declaration of Human Rights and several UN treaties and conventions (listed above) mandate consent of both parties as an essential element of marriage and rely on government registration of both marriages and births to prevent forced and/or early marriage (United Nations GA Res 69/156).

The UN’s Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) in Article 16(2) requires that all member States and Parties must ensure that “the betrothal and marriage of a child shall have no legal effect” and also requires that “all necessary action, including legislation, shall be taken to specify a minimum age for marriage and to make the registration of marriages in an official registry compulsory.”

Since minors are deemed incapable of giving informed consent, forced marriage encompasses child and early marriage. The Special Rapporteur on Slavery, Gulnara Shahinian (2010), reported: “... Under international human rights law, a child cannot provide informed consent to a marriage. The marriage of a child is therefore considered forced and falls under the slavery-like practices defined in the Convention against Slavery.”

**What Is “Forced Marriage”?**

The United Nations General Assembly’s United Nations (2009) equates forced marriage to a contemporary form of slavery. The report defines forced marriages as those “in which a spouse is reduced to a commodity over whom any or all the powers of ownership are attached. ... the root causes of servile marriage ... include gender inequality, ideas of family honour, poverty, conflict and cultural and religious practices.” Numerous UN conventions define the conditions under which marriage may be considered “forced.” The Supplementary Convention on the Abolition of Slavery, the Slave Trade and Institutions and Practices Similar to Slavery of 1956 references, situations in which “A woman, without the right to refuse, is promised or
given in marriage on payment of a consideration in money or in kind to her parents, guardian, family or any person or group.”

According to the Trafficking in Persons Report, “marriage induced through force, coercion, or deceit ... Forced marriage is one entered into without full consent and under duress, where the individual has no right to choose a partner or ability to say no” (The United States Department of State 2010). The international definition of trafficking in persons in the United Nations Trafficking Protocol covers trafficking for the purpose of exploiting people in “practices similar to slavery” and offers the following definition of forced marriage.

*Forced marriage* shall mean any institution or practice in which:

(i) A woman [person] or child without the right to refuse is promised or given in marriage on payment of a consideration in money or in kind to her [his] parents, guardian, or family or any other person or group.

(ii) The husband of a woman, his family, or his clan has the right to transfer her to another person for value received or otherwise.

(iii) A woman on the death of her husband is liable to be inherited by another person.

**Circumstances Under Which Marriage Can Be Classified as Forced Marriage: Servitude, Slavery, and/or Trafficking**

When marriage turns into domestic servitude and/or sexual slavery, it can be classified as forced, servile, slavery, or trafficking. A report by the 2005 Council of Europe and Forced Marriage in Council of Europe Member States uses a broader definition according to which forced marriage constitutes an umbrella term covering marriage as slavery, arranged marriage, traditional marriage, marriage for reasons of custom, expediency of perceived respectability, child marriage, early marriage, fictitious, bogus or sham marriage, marriage of convenience, unconsummated marriage, putative marriage, marriage to acquire nationality, and undesirable marriage – in all of which the concept of consent to marriage is at issue.

The United States Department of State (2010) purports that child/forced marriages render females vulnerable to abuse and exploitation by their spouses or others, who exercise significantly greater power and control. Such marriages trap the victim in conditions of enslavement, particularly in domestic or sexual servitude (The United States Department of State 2010). The victims of early/forced marriage have no choice but to perform the tasks expected of them, such as domestic chores and shop or farm work, and engage in sexual intercourse with their husbands or whoever they are ordered to. If they refuse to do so, or if their performance is unsatisfactory, they face physical, psychological, and sexual abuse (Gulnara Shahinian 2010). Given the subtleties of child/forced marriages, they can irrefutably be classified as cruel and harmful as traditional forms of slavery and modern forms of human trafficking.
Marriages as Means to Control the Marginalized Classes of the Society

Social customs, culture, and assigned status to different classes play a significant and incontrovertible role in establishing and managing social as well as interpersonal relations. Marriage, being the cornerstone of human interpersonal relations, is regulated and controlled by the members of the class that has the socially assigned higher status (Kakar 2016). In cases of marriage — powerful and rich males are the members that belong to the class that has been assigned power, authority, and responsibility to dominate and manipulate most of the activities of the members of the marginalized classes, specifically females, from birth to death including who they will marry, when they will marry, and for what purpose the marriage will take place (Kakar 2017).

Kidnapping or Abduction

When one or both of the individuals getting married are kidnapped or abducted and marriage is performed, then it can be classified as a forced marriage. In the times of conflict and situations where girls are kidnapped or abducted in peacetime or conflict for the purpose of using them as wives obviously fall within the category of trafficking for sex and labor as these girls are forced to provide sex, do all the housework, bear children, and take care of men. The marriage of girls in conflict times, wartimes, and natural disasters has been documented in many countries including Haiti, India, Pakistan, Afghanistan, Somalia, Northern Uganda, Algeria, Chad, Sudan, Lebanon, and Palestine. In some cases, families themselves hand over young daughters to warlords and militia members for marriage during conflict in the hope of securing greater protection for the family and possibly protect the girls themselves from rape or other forms of sexual exploitation and brutality (Turner 2013).

Marriages Without Clear and Full Consent of One or Both Individuals Getting Married

A marriage that is characterized by coercion, where individuals are forced to marry against their will, under duress and/or without full, free, and informed consent from both parties falls under the category of trafficking and can be classified as such. Marriage at any age, where the notion of consent is nonexistent and the views of bride or groom are ignored, is tantamount to slavery, servitude, and trafficking venture. As discussed above, the 1926 Slavery Convention, Article 1 (1) demonstrates how marriage may and can amount to slavery. It defines slavery as “the status or condition of a person over whom any or all of the powers attaching to the right of ownership are exercised.”
Marriage Where One or Both of the Individuals Getting Married Is/Are Minor(s)

When one or both of the individuals getting married are underage and considered minors, then it can be classified as a forced marriage. The Universal Declaration of Human Rights states that individuals must enter marriage freely with full consent and must be of full age. In 1979, the Convention on the Elimination of All Forms of Discrimination Against Women stated that child marriage is illegal. In 1989, the Convention on the Rights of the Child defined children as persons under the age of 18 years. Many countries passed laws changing the legal age of marriage to 18 years. Any marriage where one or both of the individuals getting married are minors can easily turn into servile marriage and/or human trafficking. Children forced into marriage have a high probability of being trafficked for sex and/or labor by and for the financial gain of his or her spouse.

Deception/Fraud

If one or both of the individuals getting married are tricked into getting married, then it is a forced marriage. Such marriages that are performed under fraudulent auspices have higher probability of becoming a form of human trafficking. According to Weissbrodt (2002), a marriage where an individual is duped into a relationship that he/she has had no informed consent, is under full control of another, has no freedom of movement, has no control over his/her personal belongings, and has no freedom to agree or disagree to any of the activities he/she engages in and any refusal is accompanied by the threat of violence or actual violence is tantamount to slavery and/or trafficking as the individual is “enslaved” through the physical, psychological, and/or economic powers of “ownership” and control exercised over her/him.

Economic Incentives

When motive behind the marriage is economic, i.e., parents or guardians of the girl agree to marry their daughter off to a man without her consent and receive some sort of money, other gifts in kind, or other incentives in exchange, then it is a forced marriage and falls within the confines of slavery and human trafficking. The girl is equated to a commodity and exchanged for money, land, or some other form for status enhancement of the parents or guardians. In such an arrangement a young woman might be given in exchange for money or other payments, she could be sold to someone else and might be inherited by another person if her husband or the husband’s family so desires. In some cases, young girls and women are forced to marry wealthy older men to become sexual and domestic slaves as the men are able to pay a greater amount of money to the parents or guardians in exchange.

In some cultures, parents and families of the girls use marriage as a means of enriching themselves or relieving themselves of financial burden. The 2010 TIP
Report observed “in many countries, forced or coerced marriages are used by parents and families for many reasons such as to settle debt, receive dowry payments, further economic interests, relieve poverty, obtain residency permits, display status, provide inheritance, counteract promiscuity, and serve as compensation for a wrongful death” (The United States Department of State 2010).

Such marriages are carried out like business transactions – where rich older wealthy men seek to buy a younger wife and where young women and girls are treated as merchandise. Young beautiful girls and virgins fetch higher prices and are often used for sex work, prostitution, dancing nude in clubs and bars, entertaining clients, and/or sex slavery, while older women are used for domestic servitude and/or other types of labor. Such marriages are gross violations of the rights of girls and women and expose them to multiple risks, including sexual abuse and exploitation (Kakar 2016, 2017).

**Marriage as a Means of Enriching and Consolidating Power**

When marriage is used as a means of consolidating power and the individuals getting married do not have any power to refuse or end marriage, then it falls under the confines of slavery and trafficking. According to the United Nations Population Fund (2012), some of the factors that promote servile/forced marriages are poverty and economic survival strategies, sealing land or property deals or settling disputes, control over sexuality and protecting family honor, tradition and culture, and insecurity, particularly during war, famine, or epidemic. Such social conditions coupled with the accepted marginalized social status of women and girls facilitate acceptance of forced/servile marriages (Kakar 2016).

Such marriages serve as means of enriching and consolidating powers of the guardians/parents without any implicit or explicit consent of one or both individuals who are getting married. From the times memorial, marriages have been used as means to strengthen familial bonds. It has been more a matter of money, power, and survival than of delicate sentiments such as love, consent, or free will. Forced marriages have been very intimately embedded in the social and cultural fabric of the society. In ancient times early marriage was a norm to secure a safe environment in which to breed, handle the granting of property rights, and protect bloodlines. The ancient Hebrew law required a man to marry his brother’s widow in case of the brother’s death. Similar practices are common in India as well. In the ancient world, marriage served primarily as a means of preserving power, with kings and other members of the ruling class marrying off daughters to forge alliances, acquiring land, and producing legitimate heirs, and women had little say over whom or when they married.

**Extent and Prevalence of Forced Marriages: How Many?**

The covert nature of forced marriages and the fact that forced and underage marriages are prohibited in almost all parts of the globe contribute to the scanty records on such marriages. If one goes by official marriage statistics and records, forced
marriages are virtually nonexistent. Any data that exists is either anecdotal or based on the handful of extreme cases that get reported to the authorities. As such there is a paucity of reliable data to estimate how many marriages end up as forced marriages. Since no systematic data are collected or maintained on forced marriages, it is difficult to document the true prevalence of forced marriages for several reasons (Kakar 2016).

Another reason for not having the real solid statistics on forced marriage is the fact that in most communities and cultures around the globe, marriage is regarded a private, communal, and familial event solemnized by religious, cultural, and communal customs. Religious and community leaders who hold the highest status in the society are often delegated with the responsibility of controlling, managing, and documenting marriages. They are entrusted with the task of ensuring compliance with the social and cultural norms. In many cultures, even today, official registration of a marriage is not deemed necessary. As a result, many of the marriages are unregistered and unofficial. Marriages that are servile, forced, or underage are nonexistent in official records and registry as these are not recorded or registered for very obvious reasons (Kakar 2016).

However, recently some agencies have started collecting data that provide some estimation. For example, in 2015 the Home Office and Foreign and Commonwealth Office of the United Kingdom (UK) established a Forced Marriage Unit (FMU). According to the FMU, in 2016 the FMU gave advice or support related to a possible forced marriage in 1428 cases via its public helpline and email inbox. This represented an increase of 14% (208 cases) from 2015. Out of these 371 cases (26%) involved victims below 18 years of age; and 497 cases (34%) involved victims aged 18–25. In 2016, the majority of cases 1145 (80%) involved women victims, while 283 cases (20%) involved male victims (the Home Office and Foreign and Commonwealth Office of the United Kingdom, Forced Marriage Unit 2016). Granted these estimates are based on the cases where victims/survivors sought assistance and these estimates may be and perhaps are far below the actual number of cases that exist, nevertheless, these can provide some estimation on its prevalence.

According to a report published by The Home Office and Foreign and Commonwealth Office of the United Kingdom, Forced Marriage Unit (2017), in developing countries in South America, North Africa, and parts of Asia, one in three of all under 18-year-olds, and one in seven of all girls under the age of 15 are married. According to the same report, the rates of early and forced marriage are also high in Europe, with the highest percentages in Central and Eastern Europe where 2.2 million girls have married before their 18th birthday. The highest rates are in Georgia (17%) and Turkey (14%). At least 10% of the adolescents marry before the age of 18 in Britain and France. These statistics indicate that forced marriage of underage children is a serious problem existing in all parts of the globe. According to the Forced Marriage Unit, Home Office and Foreign and Commonwealth Office, in 2017, their office received more than 1196 calls from girls who reported being at risk of being forced into marriage (The Home Office and Foreign and Commonwealth Office of the United Kingdom, Forced Marriage Unit 2017).
The United Nations Population Fund Report (March 2013) predicted that if no action is taken to curb forced marriages and current levels continue, approximately 14.2 million girls annually or 39,000 daily will marry too young and majority of these will be under the age of 15 and forced into sexual and domestic servitude. The United Nations International Children’s Emergency Fund (2018) reported that by 2017, there were 21% of all women in the world who were married before the age of 18.

According to the United Nations Human Rights, the Office of High Commissioner for Human Rights (2012), each year about ten million girls are married before the age of 18, and many of these brides are as young as 8 years old, and they are being married off to men who may be three or four times their age. According to the United Nations Population Fund (UNFPA Annual Report 2015) in developing countries, one in every three girls is married before reaching the age of 18. One in nine is married under the age of 15. The UNFPA Annual Report (2013) reported that according to their estimates, every year over 14 million girls marry while under the age of 18 – that’s around one girl every 2 s – and the number is growing. Fight Slavery Now Organization (2012) reported, “sixty million girls around the world have been forced into marriage before the age of 18, a number that grows by 25,000 child brides every day. Tragically, 1 in 7 girls in developing countries is married by age 15 – often to a man twice her age or older.”

**Forced Marriage and Human Trafficking**

A report produced by the United States Department of State (2014) contends that marriage turns into trafficking enterprise when force, fraud, coercion, or abuse of power are used as means to manipulate wives and subject them to slavery-like conditions such as domestic or sexual servitude. The United Nations Office on Drugs and Crime (UNODC) Model Law and the United Nations’ Supplementary Convention on the Abolition of Slavery 1956 define forced marriage as “a practice similar to slavery.” The Supplementary Convention on the Abolition of Slavery 1956 states “practices similar to slavery” include:

> the status or condition of a person over whom control is exercised to the extent that the person is “treated like property”. Another definition of slavery, which focuses on the core of the crime – that is, the objectification of human beings – is “reducing a person to a status or condition in which any or all of the powers attaching to the right of property are exercised.”

According to the **UNODC Model Law against Trafficking in Persons**, practices similar to slavery are defined as follows:

> Practices similar to slavery shall mean the economic exploitation of another person on the basis of an actual relationship of dependency or coercion, in combination with a serious and far-reaching deprivation of fundamental civil rights, and shall include debt bondage, serfdom, forced or servile marriages and the exploitation of children and adolescents.
Dynamics of Forced Marriages

Forced marriages represent a multilayered issue penetrating all aspects of the society. The irony is that the forced marriages perpetuate even when they are indisputably condemned worldwide and no State in the world that adheres to the tenets of democracy and human rights condones such practices. Despite such strong disdain for the forced marriages, they happen all over the world every day as discussed earlier in the chapter. The following discussion provides an overview of the dynamics and what social and cultural variables facilitate perpetuation of such practices.

Forced Marriages and Marginalized Social Status of Females

In almost all societies, marriage is treated as a familial and social event. In most cultures, it is considered a matter governed by religion and culture. Around the globe, in many cultures, marrying young women and girls off to a rich person in consideration for money or other forms of payment is acceptable or at least tacitly permissible. Females are portrayed as commodities that can be sold to the highest bidder to serve a myriad of purposes. Additionally, in many cultures, women and girls are perceived to be burden and liability, and marrying them off at an early age when they are still virgins not only relieves the parents of providing for their daughters but also helps them in enhancing their social and financial status by association with richer families.

The United States Department of State (2010) testifies “marriage induced through force, coercion, or deceit is a global phenomenon engendered by cultural and societal norms about the institution of marriage and the roles of spouses."

The Human Rights Council’s report on forced marriage (2012) stated, “...from an early age, girls are brought up and viewed as commodities to be used to solidify family links and preserve honor, in addition to financial assets that can improve the family’s economic status.” The advances in technology and Internet have irrefutably assisted human trafficking organizations in enabling them to effectively converging marriages and sexual and labor servitude (Sico 2013).

Family Honor and Pride

In many cultures, getting daughters married off before the age of puberty is a matter of pride and honor while having unmarried grown-up adult daughters (past 18 years) who stay at home is a sign of social stigma. Thapa (1996) reports that in many cases, parents and/or guardians of young girls are concerned that girls, once past puberty, may also be more vulnerable to rape and other sexual exploitations by strangers as well as neighbors, family members, and others. Such an incident will not only be traumatic to the girl but will lead to rejection of the girl in marriage to anybody else due to the cultural stigma attached to rape. Thus, parents and/or guardians feel
socially and morally obligated to arrange and have their young daughters married off before they become victims of rape or sexual exploitation.

**Customs, Religious Beliefs, and Servile and Forced Marriages**

Cultural, social, economic, and legal elements play a critical role in perpetuating forced marriages and transforming these marriages into an industry that merges sex and labor trafficking across the globe (Rachelle 2013). In forced marriages women and girls are essentially sold as commodities in transactions that are legitimized through the recognition of the legal binding of marriage. Some literature suggests that despite the risks involved, many victims themselves seek assistance of the marriage brokers and participate in the process and transactions.

According to a Joint Release Committee by the United Nations Population Fund Report, UNICEF Annual Report (2013), in marriages, social and cultural traditions override any logic. Traditions, rituals, and norms embedded in religion and faith are used as guiding principles. Social pressures within a community generally guide the activities of the members. In some cultures, having young children married is the most desirable accomplishment and a matter of pride.

**High Premium on Virginity**

In many cultures, a high premium is placed on virginity and considered the prime requirement for marriage. Girls who are not virgins are treated as used goods and have a difficult time finding someone to marry. The only option left for parents is to either shun them from the society, sell them into marriage to the highest bidder, or worse, kill them, as having a daughter who has lost her virginity before marriage is a liability and a great disgrace and dishonor for the whole family (Raj 2010).

Poverty and economic survival strategies, status enhancement, sealing property deals or settling disputes, control over sexuality and protecting family honor, tradition and culture, and insecurity, particularly during war, famine, or epidemic, are some of the most significant factors that perpetuate forced marriages despite almost every nation’s laws prohibiting it. Such social conditions coupled with the accepted marginalized social status of women and girls facilitate normalization of forced marriages.

Cultural beliefs, among many communities, such as “girls become impulsive and develop desires to engage in intimate relationships with the opposite sex once they reach puberty. They may engage in sex before marriage and lose their virginity” creates further apprehensions among the respective communities, parents, and guardians as such an act on behalf of the young girls will tarnish the family reputation and cause a permanent social blemish onto their parents’ and siblings’ reputation diminishing impoverished families’ ability further to find bachelors for grown-up daughters in their economic social group. Such fears and social pressures are some of the significant variables that allow and perpetuate forced or child
marriages. One of the underlying rationales behind a family’s arrangement of a child marriage is preservation of the girl’s virginity and, by extension, the family’s honor (see http://www.errc.org/roma-rights-journal/child-marriage-a-cultural-problem-educational-access-a-race-issue-deconstructing-uni-dimensional-understanding-of-romani-oppression). Thus, family members, especially the male members, take it upon themselves to preserve family reputation. They believe that it is their responsibility to keep their sisters or daughters insulated from rapes, unwanted sexual advances, unwanted pregnancies, or other related problems and have them married off to older and richer men.

According to Laiou (1993) and Kraemer (1993), in ancient societies it was customary for girls to be betrothed at or before puberty. Friedman (1980) reported that the optimal age for girls to marry was often considered age on or before the age of puberty. Demand (1994) stated that in ancient Israel, the father of a young girl felt that “arranging and contracting the marriage of his daughters were his undisputed prerogatives,” and there was not to be any question as to his authority to have the marriage arranged without the permission or even knowledge of his daughter.

Customs, religious beliefs, social acceptance and approval of forced marriages, poverty, and marginalized status of the females are some of the most significant reasons why such practices persist despite universal condemnation of such marriages.

Forced Marriages in the Context of Human Rights Violation

Forced marriages constitute gross violations of human rights. Such marriages subject spouses not only to inhumane conditions but also strip them of their identity, self-esteem, and individuality. Spouses, generally wives, are treated and traded as commodities. Children by virtue of being children are “incapable of consent or of exercising the right of refusal” (Huda 2007: 9). Thus, any marriage of a child by default is a forced marriage and constitutes a violation of human rights (“What We Can Do to Help,” Forced Marriage Unit 2009). The United Nations Convention on the Rights of the Child and the United Nations’ Universal Declaration of Human Rights condemn forced marriage generally and child marriage specifically. Forced marriages deprive the victims of their identity and individuality and mar any and all potential. Such marriages degrade human beings to objects.

Article 16(2) of the UN’s Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) requires that all member States and Parties ensure that “the betrothal and marriage of a child shall have no legal effect” and also requires that “all necessary action, including legislation, shall be taken to specify a minimum age for marriage and to make the registration of marriages in an official registry compulsory.”

Child marriages fall within the definition of servile/forced marriage “since children are, by definition, incapable of consent or of exercising the right of refusal” (Huda 2007: 9). Child marriage is a violation of children’s rights under the United

Despite the fact that international law prohibits forced and servile marriage as it classifies such a marriage as a form of slavery and a human rights violation (Meyersfeld 2011), forced and servile marriages take place in almost all parts of the world.

Conclusion

In a Thematic report on servile marriage, Gulnara Shahinian (2010) states that in forced marriages, a spouse is reduced to a commodity over whom any or all the powers of ownership are attached. These marriages cause irreparable damage to the victims and the society in general. These detrimental effects are felt in all aspects of social, emotional, psychological, and economic lives. A forced marriage is similar to the various forms of exploitative behaviors and slave-like practices as defined in the Supplementary Convention on the Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery. It is incumbent on all members of the globe to understand the effects of forced/servile marriages and endeavor to prevent such marriages and support victims.

According to the same Special Report (Gulnara Shahinian 2010), victims of forced/servile marriage are often unable to escape because their families and/or the societies in which they live entrap them shunning them as an anathema. They are denounced because they are damaged goods and supporting them will be against communities’ traditional, cultural, and religious beliefs – the same beliefs and practices that are used to justify servile marriage. Thus, it is incumbent upon the States to take action and make amends to the victims for the wrongs done to them. “Under the Supplementary Slavery Convention, States parties are to bring about the complete abolition or abandonment of slavery-like institutions and practices, such as servile marriage. It does not provide for any exceptions in which slavery may continue to exist. Evolving international law has confirmed that slavery is a crime against humanity and, as such, no culture, tradition or religious practice can be used to justify servile marriage” (Gulnara Shahinian 2010).

The desperation to escape poverty and political pressures greatly increases the likelihood that parents/guardians as well as women and girls would risk leaving home, family, and friends to marry strangers and be entrapped in servile marriages. Traffickers use the guise of a respectable and legally binding marriage to legitimize sex and human and labor trafficking. Servile/forced marriages provide a legitimate front for entrapment of unsuspecting girls into exploitation and ultimately sex and labor servitude. Under the guise of marriage, traffickers are able to defraud victims and the authorities in States of origin and destination as well. Majority of the countries in the globe allow visas and lawful entries for spouses and fiancés. The fact that the process is a form of prostitution, human trafficking and sexual exploitation is disguised as marriage and/or promise of marriage dupes unsuspecting
nations into providing visas. Such a façade also tricks families who are too eager and too desperate to marry their daughters off to the prospective rich husbands.

The Human Rights Council needs to develop a more comprehensive approach to the issue of forced marriage, and all States of the globe need to enact legislation to prevent forced marriage, provide support to victims, and launch campaigns to raise awareness of forced marriage and its negative impact.

In order to fully fathom the repercussions of forced marriages and address the problems related with them, States need to recognize forced/servile marriages in terms of slavery-like practices, trafficking, and human rights violations. Such an understanding provides a clear and concise grasp of the violations that victims endure, and the kind of interventions are required to prevent, monitor, and prosecute forced marriages. All States need to develop victim protection programs and adjust accordingly to support victims of servile/forced marriages. If servile/forced marriages are understood in the context of trafficking, slavery, and human rights violations, then the efforts, programs, and strategies should be focused on not only protecting the rights of women and girls but also obliterating slavery and trafficking.

### Gang Sex Trafficking: Definition

A “gang” is an enduring group with three or more members who share an identity, view themselves and are recognized as a gang, has organization, and is involved in criminal activity (Fox 2013). Sex trafficking (Trafficking Victims Protection Act of 2000 (TVPA, 8 U.S.C. § 1101) (Congress 2000) is: “the recruitment, harboring, transportation, provision, or obtaining of a person for the purpose of a commercial sex act in which [said] act is induced by force, fraud, or coercion, or in which the person forced to perform... is [under] age 18.” The United Nations (UNODC 2004) also employs the AMP (Act-Means-Purpose) model in its definition of human trafficking under the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children of 2000 (also known as the Palermo Protocol), which was developed around the same time as the TVPA. The Palermo Protocol specifies further what is included in the means of force, fraud, and coercion: deception, abduction, “abuse of power or a position of vulnerability, or giving payments or benefits” (UNODC 2014). These terms can be contentious between countries that view their meanings differently (Tyldum 2010). Likewise, state human trafficking statutes in the United States do not necessarily line up with the federal definition of human trafficking, and while their recent enactment and use is lauded and encouraged, challenges still exist in understanding and applying the new laws (Farrell et al. 2014). Transportation to another location may or may not be part of the equation in a trafficking situation (USDOS 2015), although movement is stipulated in the Palermo Protocol and by many scholars in their trafficking research (Tyldum 2010).
Introduction

Gangs in the United States have long funded their activities from, and participated in, domestic and international sex trafficking. Whether Caucasian Motorcycle, African American, Asian, African immigrant, Native American, Hispanic, Eastern European, or other types of gangs, these groups have realized the potential in exploiting vulnerable individuals as a high-profit, low-risk enterprise. This chapter examines different types of sex trafficking networks in the United States by using federal case indictment documents as a starting point and then comparing these US gangs to what is known about gang sex trafficking in several other regions.

At the outset, it is important to be clear that gang sex trafficking enterprises and gang-run prostitution rings involving sex workers who are not trafficked often overlap, making it difficult to separate network members into distinct groups engaging in only one activity or the other (Morselli and Savoie-Gargiso 2014). A prostitution ring may involve some workers who are trafficked and some who are not, but the gang-run enterprise shares members and resources regardless of the proportion that trafficking victims that make up of the total number of prostitution providers in that ring. Both types of activity are often intimately intertwined and must be understood as such, often sharing resources, members, and criminal business practices. The main difference is at the sex worker level and is made based on whether one sex worker is kept in line via force, fraud, and/or coercion and whether another is there by choice, or at least not by the coercion of another. Otherwise, these two types of business operations are usually entangled in the same rings. Perpetrators also understand and treat trafficking as a business (Shelley 2007, 2010), and it is discussed in those terms here.

Method

This chapter uses a review of the literature on gang sex trafficking in the United States and in several regions of the world, supplemented by a comparison of indictments from 20 US gang network cases from 1981 to 2017. These gang cases were compared based on type of gang or trafficking, size, location, complexity, and summaries of case facts in terms of business practices, means of control used, and criminal charges prosecuted.

Some of the US cases utilized racketeering charges, while others used conspiracy statutes to be able to prosecute these gang networks as groups rather than prosecuting each individual separately. The 2008 renewal of the TVPA (see content in section “Gang Sex Trafficking: Definition”) added conspiracy and “reckless disregard” provisions to the previous incarnation of the TVPA that formerly required perpetrators to “knowingly use” force or coercion (Smith 2010). This allowed Federal prosecutions to include those who “knowingly benefit from trafficking crimes,” and some Federal statutes were amended to include obstruction of trafficking investigations as prosecutable offenses (Smith 2010). This allows for prosecution and culpability of individuals who may be facilitators of activity, even if they do not participate in human trafficking themselves, and is
helpful in proving gang and other network cases. Earlier, in the 2003 renewal of the TVPA, human trafficking had been added as a predicate offense (A predicate offense in a RICO case is a criminal violation that can be used to substantiate the existence of a criminal enterprise.) to the federal Racketeer Influenced and Corrupt Organizations (RICO) Act, which was originally enacted as part of the Organized Crime Control Act of 1970 (Federal RICO has been amended numerous times to reflect court decisions and known realities in applicable organizations and criminal activities. The current federal RICO statute can be found in Title 18, Chapter 96, of the US Code.) Seven of the case indictments examined here (five RICO, two conspiracy) also involved asset forfeiture of criminal proceeds, or of assets used to further the business such as cars, funds, electronics, and in one case even a hotel. All cases were gang enterprise prosecutions. The complete list of cases compared is in Table 1.

After an examination of American gang sex trafficking types via the literature and analysis of these indictments, the American types are placed in global context using previous literature detailing the dynamics of gang and organized sex trafficking in

Background

US Sex Trafficking Types

Gangs engaging in sex trafficking in the United States may engage in domestic sex trafficking, international sex trafficking, or both. They tend to organize primarily, though not exclusively, along racial or ethnic lines. Major US trafficking types outside of those associated with gangs include highly organized Asian massage parlor networks with strong ties to their origin countries; brothels, many of which are run by closed Hispanic networks (some of which may be gang-affiliated); Russian and Eastern European topless bar networks; and small groups and individuals of all races and ethnicities engaged in trafficking either via internet, escort services, or on the street (Dank et al. 2014).

Gang Sex Trafficking Patterns in the United States

In the eight cities included in Dank et al.’s (2014) examination of the underground commercial sex economy in the United States – San Diego, Miami, Dallas, Washington DC, Kansas City, Denver, Seattle, and Atlanta – six were found to have gang (For the purposes of this study, the term “gang” is defined as “a group which has three or more members, generally aged 12–24, who share an identity, typically linked to a name and often other symbols, view themselves as a gang and are recognized by others as a gang, the group has some permanence and degree of organization, and the group is involved in an elevated level of criminal activity” (Fox 2013). This is consistent with the definition used by the National Gang Intelligence Center, which is the Federal Bureau of Investigation-coordinated clearing house for gang intelligence between Federal, state, and local law enforcement in the United States.) involvement in trafficking, and three reported the activity being dominated by gangs, including inter-gang cooperation (Dank et al. 2014). Further in Dank et al.’s study, law enforcement from three cities reported significant hierarchical structures indicative of organized crime involvement. Five sites reported that offenders frequently communicate with one another. Three reported sophisticated money laundering operations. Four reported that many sex traffickers were former drug traffickers, and four reported sex traffickers concurrently dealing drugs. Three sites have significant Asian involvement in trafficking, two reported significant Eastern European involvement, and five have significant Latino involvement (Dank et al. 2014).

While gangs are typically thought of as having territories and engaging in turf wars, particularly in popular conceptions about street corner drug markets (Papachristos et al. 2011), it was discovered by Dank et al. that rival gang cliques,
or locally affiliated gang subgroups, have begun cooperating with each other when it comes to prostitution. Indeed, previous literature on gang homicide describes ally relationships among gangs that change over time as often as rivalries do (Braga et al. 2013; Decker and Curry 2002; Nakamura et al. 2011). While a number of rules certainly apply, Dank et al. (2014) found that gangs have realized they can make more money working together and pooling resources than they can working apart. The use of the Internet to facilitate business also means the commercial sex market is now less based on geographic turf (Korsell et al. 2011; Rocha et al. 2010), so there is no longer the need to keep others “off your corner.”

Pimps (Notes on terminology of “the life”: the word “pimp” is a loaded term with many cultural meanings beyond simply denoting one who manages and profits from the prostitution of another. However, like Dank et al. (2014), this chapter uses the word “pimp” because it was commonly found in all the primary data sources. It was also used by the network participants to describe themselves in police interviews (Lugo 2016), although victims just as commonly referred to pimps as their boyfriends. “Bottoms,” or “bottom bitches,” are female members of the network who typically fill the role of a “lead prostitute” in charge of recruitment, training new recruits, enforcing quotas for how much money each prostitute was to bring in daily, and enforcing the “rules of the game.” Bottoms were often also given the task of carrying out violence on behalf of the pimp so that he could mitigate risk and keep being seen as a good guy. A bottom typically started as a regular prostitute that later moved up in rank. This position usually results in some perks and some relief from being the recipient of violence herself. Legally, she falls into a gray area because she becomes both victim and offender (Dank et al. 2014; Petrunov 2011; Lugo 2016).)

and sex workers (In instances where both voluntary sex workers and sex trafficking victims may be involved, the term “sex worker” will be used in this text for simplicity.) cite many of the same reasons for becoming involved in commercial sex. These include neighborhood influence, family exposure to sex work, lack of job options, or encouragement from a significant other or acquaintance. Individuals who are struggling to meet basic daily needs like shelter and food are obvious targets for traffickers, especially minors who may have run away from home or been kicked out. Other vulnerabilities include mental illness; learning disabilities; loss of a caregiver or family support; history of physical, sexual, or other abuse; recent discharge from a juvenile or drug treatment facility; living in foster care or in an area with concentrated disadvantage; or having family members already in “the life” (Carpenter and Gates 2016; Clawson et al. 2009; Dank et al. 2014; Estes and Weiner 2001; Polaris 2015). Youth are considered easier targets, with the average age of entry estimated to be between 14.5 and 19 depending on the study – not 12 as cited in many advocacy campaigns (Carpenter and Gates 2016; Marcus et al. 2014; Raphael and Myers-Powell 2010).

While the majority of sex trafficking and consensual pimping (The use of the word “consensual” here refers to a pimp-sex worker relationship between adults with no force, fraud, or coercion involved – see section on the legal definition of human trafficking above.) in the United States is committed by individuals or small groups of two to three individuals, domestic gang sex trafficking networks represent a type
of trafficking seen in cities and suburban communities and on travel circuits throughout the United States (Clawson et al. 2009; Dank et al. 2014). The proceeding section on the dynamics of American gangs will begin by discussing sex trafficking patterns in African American gangs and then compare the similarities and differences in other types of gangs to this reference point.

Dynamics of Gang-Controlled Sex Trafficking

Recruitment
Recruitment of victims by US gangs of domestic origin occurs in several ways. Sex trafficking victims in domestic networks can include female gang members sometimes initiated via a “sex-in,” where a recruit is forced to have sex with many gang members in rapid succession to cement her membership and to desensitize her to the activity. Those already in “the stable,” or already working for a particular pimp, may be made to recruit others. In rare cases, victims may be kidnapped. Gang-associated girlfriends of members, family, friends, and acquaintances are the most likely targets for “love-bombing,” or the Romeo method (Fox 2013).

The “love-bombing” method may begin with wooing, building trust, then asking her to have sex with another gang member “just this once” for money, then discouraging her from having sex for free, and eventually having her engaging in sex work regularly as “proof of love” for the pimp – even for victims that still live at home and attend school (Fox 2013; Dank et al. 2014).

Later, once she has been initially “wooed” in, the elements of force, fraud, or coercion may be introduced to control the victim and ensure she brings in a profit. The “girls in the stable” are the most likely to be confined to hotel rooms and subjected to severe violence, though violence is possible with all these groups (Fox 2013). Recruitment of pimps by prostitutes is less commonly reported (Dank et al. 2014) and is mostly mentioned by pimps themselves (Marcus et al. 2014). Victims trafficked internationally and by gangs of immigrant backgrounds are often promised employment in restaurants or other venues in the United States and then duped into a sex trafficking situation to repay smuggling debts after arrival, and in some cases the grooming begins in their home countries before they are brought to the United States (US v. Montes et al., 2017). Controllers may continue to alternate “love-bombing” with threats to victims’ safety and/or their families and other coercive control techniques so that the victim is manipulated into chasing the “love” experiences that eventually become fewer and farther between.

Pimp Control

Although research on traffickers and facilitators themselves is still in its infancy, it is safe to say that trafficker profiles globally and in the United States are not monolithic; they vary widely by place, culture, and victim profile (Dank et al. 2014; Marcus et al. 2014; Shelley 2010; Weitzer 2014). Within the United States, gang
trafficker profiles vary even between type and ethnicity of gang; pimps and traffickers belonging to Latino gangs operate differently than pimps and facilitators in African American gangs, for example (Carpenter and Gates 2016; Lugo 2016). The following discussion of pimp control dynamics and operations applies mostly to African American gangs and differs along some dimensions from other types of gangs, unaffiliated pimps, and pimps that function more as hired managers for voluntary sex workers that do not engage in trafficking per se (Carpenter and Gates 2016; see also Weitzer 2010, 2013, 2014; Marcus et al. 2014 for more about the importance of this distinction).

First, gang-associated pimps openly discuss with each other means of control to maintain power over victims, and they train new pimps on the same. As described above in the recruitment section, the first step is breaking down a victim’s psyche and resistance through a variety of techniques (Polaris 2015). Psychological manipulation is a primary means of control, and the complex relationships that develop are often a significant obstacle to victims leaving. This is especially true if the victim has had children with the pimp; threats to their children can be used to keep a victim “in pocket” and working (Polaris 2015).

Other means of control include economic abuse, which can include collecting most or all of the proceeds and only giving the victim an allowance for food, clothing, hair, nails, and a motel room in which to work (if applicable; Polaris 2015). Specifics about these expenses covered vary by trafficking venue for other types of gangs, but generally the resources victims are permitted to keep are restricted as a means of control. For example, a victim in a massage parlor may be provided housing in the facility rather than renting a hotel room, but she will still not be allowed to keep much of the money she earns or to move unsupervised outside of the massage parlor.

Economic abuse may also involve establishing quotas that victims must meet each day; these can range from $500 to 1500 or more (Polaris 2015; Dank et al. 2014). Victims, bottoms, and pimps in domestic gangs may add “john rips,” or client robberies, to increase revenue or meet a quota if the night has not been good (Dank et al. 2014; Lugo 2016). Risky assets, such as apartment or car leases or prepaid debit cards used in financial transactions and to keep cash out of bank accounts, may be placed in victims’ names so that victims will not go to the police for fear of getting arrested (Lugo 2016; Dank et al. 2014).

Victims of domestic US gang trafficking may also be subject to sexual abuse or rape by their pimps; beatings or other violence; isolation from others; physical branding or tattooing in visible and/or intimate locations to show ownership; confiscation of documents; control over access to drugs (both illegal, if the pimp allows his victims to use them, and those prescribed for medical conditions); monitoring or surveillance of movement, cell phones, and Internet activity; and confinement (Dank et al. 2014; Polaris 2015). The practice of allowing victims to use drugs varies, however, as a victim on drugs is harder to control, and it is harder to trust that she/he will turn over all the money earned; when drug use is allowed or encouraged, it is often limited to softer drugs such as ecstasy and marijuana (Carpenter and Gates 2016; Dank et al. 2016). The use of violence is often strategic to ensure that bruises
and injuries can be easily covered; if the injuries inflicted are severe, she may be kept in isolation until they heal (Dank et al. 2014).

Pimps in African American gangs also use a widely known set of “rules of the game,” not only to control victims by enforcing compliance but as a common language in the market. Rules for victims can include not looking at another pimp, not accepting black clients because they may be from a rival gang or may want to poach her to work for them, always giving a client the hotel room number next door so they can check him out first, meeting quotas, obeying the bottom as well as the pimp, using condoms with clients, and more (Lugo 2016). Victims may also be sold or traded between pimps: if a girl wants to “choose up” to a different pimp, she may pay a fee, or the new pimp may pay a fee to the old pimp (Dank et al. 2014). A girl may choose up because she believes she will be treated more kindly by the new pimp, for example (Dank et al. 2014). If a victim is a minor, she is also usually told which other girls or which bottom she must work with because someone over 18 must pay for the hotel room (Dank et al. 2014; Lugo 2016). Rules, again, may vary somewhat by type of gang and trafficking venue (street/motel versus commercial front brothel or trafficking out of a private home or apartment). It is important to note that trafficking refers to the activity and the force, fraud, and coercion involved, not the venue out of which it occurs.

Thus it is important to mention distinctions here between gang-related sex trafficking and gang-run prostitution – specifically, it is actually difficult to draw such distinctions within a given gang network. This is because an operation will often involve some individuals who are trafficking victims and some who are not, all working for the same pimps or sets of pimps that are members of the same gang. US v. Traylor et al. 2011 is but one example of such a case (Lugo 2016). Given that gang trafficking operations cannot always be separated from non-trafficking-related prostitution rings – they are often intertwined and share members and resources – it is important to keep this overlap in activities in mind.

**Money Use and Management**

After pimps receive their victims’ earnings and cover operational expenses (feeding and clothing their victims, paying for hotel rooms/transportation), pimps involved in African American gangs are known for spending most of their proceeds on visible consumption (Dank et al. 2014; Lugo 2016). However, recently the more sophisticated gangs are funneling some of the money into other criminal activities as their network structures become more mature (Dank et al. 2014). Pimps are not known for keeping detailed records, although some keep their own books, and some victims and bottoms maintain records on customers and transactions either on paper or in shared laptops (Dank et al. 2014; Lugo 2016). Aside from hiding assets by leasing or placing in victims’ or family members’ names, or hiding titles or cash in others’ homes, some gang-affiliated pimps also have modeling or music businesses setup for tax and recruitment purposes (Dank et al. 2014). Again, it is important to note that trafficking operations and gang-run prostitutions businesses are often intertwined.
and overlapping. This includes management of money and other resources; they are
not kept separate.

Hispanic, Eastern European, and Asian gangs operating in the United States are
more well-known than African American gangs for investing at least some sex
trafficking proceeds into other commercial ventures, such as drug and/or weapons
trafficking, rather than simply using profits for conspicuous consumption (Shelley
2010). However, some of the larger, more mature African American gangs are
beginning to do this (Dank et al. 2014). Perhaps this reflects varying levels of
need for members of different gangs to signal status in terms of material wealth. It
could also be that, since African American gangs have less of a vertical hierarchy
than others, that conspicuous consumption is a way to signal power and authority in
a way that more hierarchically organized gangs do not need to. They have their
authority established by their positions.

**US Gang Trafficking Network Types**

This purposive sample of US case indictments covers several regions of the country
and several types of gangs. Locations identified reflect the US state the case was
prosecuted in, regardless of interstate dynamics in the case, and were chosen
specifically to give a sample that reflected the entire country. Geographically speak-
ing, there were four cases in San Diego County, with two others also in California,
two each in Kansas and New York, and one each in Pennsylvania, Maryland, Texas,
Virginia, Tennessee, Minnesota, North Dakota, Florida, Arizona, and Washington
State. Numbers of individuals prosecuted ranged from 2 to 119. Types of gangs
included African American, Hispanic, Native American, Asian, and Caucasian
motorcycle, with some engaged in sex trafficking alone and some also engaged in
other criminal enterprises in addition to sex trafficking.

First, the “rules of the game” were similar across the African American gang
2014 (Crips/Bloods, San Diego), *U.S. v. Pittman* et al. 2012 (Black Mob/Skanless
(Fairfax County, VA), and *USA v. Cephus* et al. 2009 (Indiana/Illinois). These cases
also share flat, loose network structures, large membership numbers, and cooperative
behavior between cliques. Structurally, while cliques do cooperate with one another,
the Hispanic gangs in the San Diego area tend to be more hierarchical with more
military, regimented structure and rules involving stricter command and control,
including payment of “taxes” up the hierarchy by “soldiers” carrying out both sex
trafficking and prostitution activities (see also Carpenter and Gates 2016). This may
be due to the international structure of some gangs, like MS-13, where control is
more centralized than some of the more identity-based African American gangs.

Many Hispanic street gangs in the United States are often controlled by prison
gangs. Within their more hierarchical structure, they also have stricter division of
labor including rules enforcement, and they have also typically engaged in higher
proportions of weapons and drug trafficking than sex trafficking (Dank et al. 2014;
Carpenter and Gates (2016). Those gangs with more international reach also often use the need to pay back so-called smuggling debts as leverage to press individuals into trafficking situations on arrival into the United States (US v. Montes et al. 2017, U.S. v. Najera et al. 2012; U.S. v. Espudos et al. 2011). The nature of international trafficking requires structure and cooperation between many parties within and outside the gang, given the perilous and complex nature of facilitating border crossings.

Additional indictments describing networks that share cooperative behavior include U.S. v. Adan, et al. 2010 (Somali gang, Minneapolis, MN); U.S. v. Campbell et al. 2007 (African American gang, Kansas, no sex trafficking but other criminal enterprises); U.S. v. Najera et al. 2012 (Hispanic Nortenos gang, Kansas); U.S. v. Espudos et al. 2011 (Nortenos gang, San Diego); and People v. Lam 2006 (Asian gang, Monterrey, CA). Regarding the dynamics of cooperative behavior, conflicts between gangs seem to be changing from clique-based to race-based, with more murders and competition occurring along racial lines (Lugo 2016). Thus, the lines are less clear now between African American gangs. Interviews conducted by Dank et al. (2014) confirm this.

Several other structural differences between gang networks are evident as well. U.S. v. Morsette, a Native American gang case with one defendant, was reservation-based and appeared to be centrally directed by one person enforcing very harsh rules, while U.S. v. Francisco et al. in Arizona was a larger, flatter Native American gang that identified with the Bloods, with nine defendants prosecuted. Asian gangs with large memberships, such as the “Black Dragons” in People v. Lam (3 indicted, 40–50 identified), were involved with extortion from existing brothels, a venue also common among Hispanic gangs but not among African American gangs.

Twenty-nine individuals from three cliques that engaged in a tightly coordinated operation were indicted in U.S. v. Adan et al., a Somali gang in Tennessee and Minnesota that trafficked very young girls (aged 14 and under) in apartment-based exploitation and by taking them to college parties called “African parties.” The Somali pimps set up all the dates via phone calls out to clients, rather than making victims drum up their own business via the Internet, but they provided all transportation – at times picking minor girls up from school to do dates. They also took on gang aliases similar to African American gangs. So, the Somali gang shared some structural characteristics with African American gangs, but their trafficking venues and business practices were different.

One of the most violent cases of all was the Caucasian Hell’s Angels motorcycle outlaws case in Florida prosecuted in United States v. Starrett, 1995. Means of control and business practices here were highly regimented and extremely violent. The Hell’s Angels had cooperative business practices between network members and strict rules of the game, like African American gangs. But, the rules were different with the Hell’s Angels as far as who a member’s “old lady” could talk to, where she could go, and how her movements were controlled. According to the indictment, there was less love-bombing of victims with Hell’s Angels than outright kidnapping or forcing into slavery, and far more victims in the Hell’s Angels case were found murdered for breaking the rules or attempting to escape.
While deeper comparative study is certainly the next step, this initial look shows that specifics around network structure, business practices, means of control with victims, and inter-clique cooperation are most similar between African American gangs, with some parallels that can be drawn with other gang network types on the basic structural level. However, differences tend to appear along the lines of gangs’ ethnic origins and cultures. There may be less role specialization in smaller gangs, like the Black Dragons and African American gangs that cooperate only opportunistically. More specialization may occur among Hispanic gangs that have a more military structure; while the Espudos et al. indictments did not involve sex trafficking, they described a sophisticated business enterprise with specialized accounting, “tax” collection, strict command and kick-back structures, and more. Levels of violence used to control victims (or other network members, if not a sex trafficking case) vary as well. However, with slight regional variations, the differences in gang culture related to their ethnic origins and structures seem to hold across different areas of the United States.

Other Types of Sex Trafficking in the United States

Branching out from this comparison of a sample of indictments, the literature shows that other types of organized sex trafficking are also prevalent in the United States. One of the largest is the Asian Massage Parlor type, which exists all over the country, in which victims often live on site, have their documents confiscated, and have their movement severely restricted (Dank et al. 2014; Polaris 2015, 2016b). These massage parlors are often commercial front brothels. This type is highly organized and engages in long-term resource and financial planning, as well as money laundering. This type tends be characterized by more formal organized crime.

Latino brothels, another type of commercial front brothel in the United States, typically does not allow customers of other ethnicities due to concerns about detection (Polaris 2015). Trafficking in bars and cantinas, however, where commercial sex is offered as a service in the back of the restaurant, tends to serve a wider range of clientele (Polaris 2016a; Dank et al. 2014). Gangs may or may not be involved in both of those types. Latino trafficking tends to be more organized than the American Pimp model, especially the brothels, and they often remit money to their origin countries (Dank et al. 2014). Additional commonly reported venues for US pimp-controlled sex trafficking, besides hotel and street locations, include truck stops (L. Smith and Vardaman 2010), escort services, and strip clubs (Polaris 2015, 2016b). Within all of these types, but especially in street prostitution, exploited victims may be female, male, or part of the lesbian, gay, bisexual, transgender, and queer (LGBTQ) communities, with each sub-market also exhibiting specific variation (Estes and Weiner 2001).

Sex trafficking perpetration in these venues is under-researched by academics at this time (Choo et al. 2010; Countryman-Roswurm and Bolin 2014; Hepburn and Simon 2010; Srikantiah 2007). However, the growing prevalence of gangs in the American pimp scene, beyond the role of providing security for hire, is noted as an important change in the domestic commercial sex market (Dank et al. 2014; Levitt...
and Venkatesh 2007; Raphael and Myers-Powell 2010). While they previously focused more on drugs, more gangs are now getting into a wider variety of money-making activities (Dank et al. 2014). With regard to sex trafficking, they are learning which “gangbanging” practices work in that industry and which do not – hence the newer practice of setting aside some previous rivalries in order to make more money, since the risk of apprehension is far lower than with drugs, robbery, and other crime types (Dank et al. 2014).

**International Gang Sex Trafficking Types**

**Balkans/Albania**

Shelley (2007, 2010) identifies a global typology of six network types with different characteristics, of which the American Pimp model is one. First is the “violent entrepreneur” Balkan-Albanian model. They are often family-based, borne of war, violent during transport of victims, and often recruit through the “love-bombing” or “Romeo” model common elsewhere that involves feigning love so that the recruit will submit. These victims work the greatest number of hours, suffer the most violence during exploitation, and the traffickers use proceeds more for conspicuous consumption and sending money home to family rather than re-investing it in the business (see also Leman and Janssens 2008). It is not unlike the US African American gang type with respect to victimization techniques, but operations are more sophisticated due to money laundering operations and the international nature of activities. Lines between gangs, organized crime, and former government officials participating are also blurry (Surtees 2008).

**Post-Soviet Russia**

The post-Soviet Russian model is more organized, recruiting through legitimate and illegitimate employment agencies, with participants taking on more specialized functions. These traffickers are often educated, former military, and use proceeds to fund gangs, terrorist groups, and sometimes reinvest in the business (see also Leman and Janssens 2008). Both the Balkan and post-Soviet types have been shifting from ethnically based family relationships to more transnational, interethnic ties as the increase in business and the need to outsource due to geographical spread demand it (e.g., using the Camorra family in Italy for money laundering and moving operatives as needed throughout Europe) (Shelley 2007, 2010).

**China and Asia**

Shelley’s third model is the trade and development model exemplified by the Chinese, which Shelley describes as being highly organized, concerned with long-
term investment, and less violent than other models (Shelley 2007, 2010). Zhang (2014) clarifies the “highly organized” descriptor, depicting a horizontally based network of individuals and small groups that organize around transactions, based on skills that each brings to the table. Chin and Finckenauer (2012) further specify that, while organized, this manifestation of trafficking does not normally attract gangs because the profit is not high. Gangs typically do not have the patience required. Those involved are typically family men involved for business reasons only, and because they may want to remain suppliers of services over the long term, do not want to develop a bad reputation. “Triads” and other Chinese gangs are more likely to stick to gambling (Chin and Finckenauer 2012).

More widely in East Asia, human trafficking within migration channels is highly intra-regional and is typically for forced labor, sex, adoption, or marriage (J. J. Lee 2005). Trafficking in brides is especially prevalent in China, where the one-child policy has left a gender imbalance, and organized gangs have moved into this space; likewise, Yakuza-associated gangs have been involved in sex trafficking vulnerable women and girls from several East Asian countries into Japan’s robust sex industry (J. J. Lee 2005). Yakuza also have a high level of formal organization but do not represent as large a proportion of traffickers into Japan as popular lore might suggest (J. J. Lee 2005).

**Mexico/Central America to the United States**

The Mexico-US “supermarket model” operates smuggling networks that contain some human trafficking within the larger, more voluntary coyote smuggling operation (Shelley 2010). These networks can be violent and have been known to abandon people in the desert en route to destination. Heil (2012), in her ethnography of trafficking in Immokalee, Florida, describes how women may be trafficked for sex to serve male migrants who were smuggled or may have been trafficked for labor themselves. She also describes a chain-like network of interconnected gangs, with means of control including violence, misrepresenting work and living conditions, confiscating documents, and threatening deportation.

Fifth, Shelley (2007, 2010) describes the “American Pimp” type. The inner workings of this type are described in detail in the first part of this chapter. Gangs operating in this fashion seem to be fairly unique to the United States. Gangs in other parts of the world are quite different and are more akin to loosely organized crime.

**Dutch/The Netherlands**

Sixth and finally, Shelley describes the Dutch attempt to regulate the legitimate prostitution market as a way to reduce trafficking, which is still illegal. However, Huisman and Kleemans (2014) note that trafficking still occurs there despite legalizing prostitution. Further, cheaper prices for sex acts from trafficked individuals and higher operational costs from complying with regulations are driving down wages
and simply causing displacement of trafficking rather than reducing it, forcing organized crime groups and gangs to move the trafficking nature of the activity further underground (Huisman and Kleemans 2014).

**The Middle East**

Another important type is trafficking and smuggling as they manifest in the Middle East. This type is characterized by small ethnic, family, and friendship networks that operate on kinship and trust bonds, span several countries and thousands of miles (Icduygu and Toktas 2002), and operate in sort of a chain formation similar to the cartwheel structure of the Snakehead network that smuggles individuals from China to the United States (Zhang 2014). In both cases, both trafficking and smuggling often occur in the same network. In this structure, small groups of operators are connected by brokers, but no single person knows too many people outside the next step in the chain (Zhang 2014; Icduygu and Toktas 2002). The Middle Eastern form has more personal and family connections, where Snakehead network connections may be more reputation-based due to the network’s global reach. Division of labor is complex and more regimented, with transporters, document forgers, people providing shelter, recruiters, money managers/launderers, and many others providing specific functions, sometimes for more than one group. Tasks are shared with far less division in African American gangs, for example, where everyone does a bit of everything outside of a few main roles. Role specialization seems to diversify in proportion to the geographic spread of a trafficking network.

The Middle East is the largest destination area for trafficked persons worldwide (UNODC 2014) and is also an area that takes a long view of history and thus thinks of modern national borders as an irrelevant, artificial construction (Icduygu and Toktas 2002). The Nigeria-Morocco/Italy network is also structured similarly to these Middle Eastern networks, but their practices include deception about work opportunities like the post-Soviet model, and perpetrators use threats that prey on victims’ religious beliefs about voodoo as a specific means of control (Monzini 2005; Campana 2016).

**Islamic State (ISIS)**

Human trafficking is often a moneymaker for gangs in unstable areas, and it was a chief activity for the Islamic State (ISIS) for both making money and instilling fear (Welch 2016). Trafficking exploits borders that are weak not only with regard to trafficking flows, but weak for protecting against terrorism, disease, weapons trafficking, and more. Gangs of various sizes and levels of organization had traditionally facilitated trafficking, creating openings in the Middle East for ISIS to move into the space, especially in areas where people have been displaced by conflict. Members of ISIS were reported selling women and others in open, public marketplaces for sexual and other servitude (Welch 2016).
Human trafficking for ransom occurs along smuggling flows from Eritrea into the Sinai Peninsula, Ethiopia, Egypt, Libya, and Sudan, perpetrated by gangs associated with the Eritrean military and government (Van Reisen and Mawere 2017). Vulnerable refugee adults and children are kidnapped, held, and tortured until ransom is paid by the victim’s family. Human trafficking for organ harvesting and activities associated with terrorism are also prevalent. Sometimes, one military- or Rashaida-associated gang will sell a victim to another gang before the victim can be released pursuant to the first ransom payment, and then the ransom process begins all over again between the family and the new gang. “Creation of a widespread illicit internal and cross-border black market, together with stringent controls on the movement of people [that include a shoot-to-kill policy at the Eritrean border],” has led to an environment where human trafficking flourished and became embedded in the system (Van Reisen and Mawere 2017). Technology contributes by enabling electronic communications with families and money transfers for payment of ransom, as well as logistics coordination, thus allowing the practice to spread geographically to other countries in Africa.

Implications for Research

Understanding the different types of gang sex trafficking has implications for both research and practice. While this chapter began with a description of trafficking by African American gangs as a reference point for comparing/contrasting the others, the sheer amount of variation between types leads to the conclusion that the sex trafficking operations of different types of gangs are only comparable to a point, hence the usual divisions into typologies (Shelley 2010; Dank et al. 2014; M. Lee 2013). Recent work has begun to take a social network analysis approach to understanding sex trafficking networks and has begun to identify ways to compare them based on personal and business relationship types between network members (Cockbain et al. 2011; Morselli and Savoie-Gargiso 2014; Campana 2016; Mancuso 2014). But, even these show that interpretation of those results varies based on the underlying cultures in each network. For example, a relationship dynamic such as brokerage, or being the person who facilitates connections between others in the network, will confer certain benefits in one network but can mean something very different in another depending on what, culturally, that relationship means in each context (Lugo 2016). This has theoretical implications as well as implications for practice.

Implications for Practice

Grasping the differences between sex trafficking network types, how each type operates and is motivated, and how many resources its operations may also share with non-trafficking-related prostitution (gang network members engaged in both
forms of the activity, shared money, trafficking victims being made to work with non-trafficked sex workers, etc.) is also critical for successful law enforcement strategies and to help survivors appropriately and in culturally competent ways. Some gangs, like African American gangs, are motivated more by the ability to signal status, especially in disadvantaged communities, and the ability to make a lot of money quickly and easily. There is also some motivation to exert dominance not only in the gang, but over the women and girls both in the gang and in the stable. This is not to say that the women and girls are completely powerless – they still make important choices from within their highly constrained circumstances – but there is strict enforcement of the “rules of the game” both physically and through coercion to maintain that power imbalance and control over those being trafficked. All of these motivations have implications for law enforcement and service provision for survivors, especially if they have children.

There is minimal sophistication in operations, though organizational learning does happen, and gangs tend to grow in sophistication as they mature. However, contrast this with a more highly regimented Hispanic gang that tends to stay more closed off from outsiders and is thus more difficult for law enforcement to penetrate; an Asian Massage Parlor network that is highly sophisticated, secretive, and controlled; and the Caucasian Motorcycle gang that exerted extreme violence with impunity; and it becomes clear that law enforcement techniques must vary to find each network type’s cultural and operational vulnerable points. There is no one-size-fits-all description, and there must be as much nuance in law enforcement and victim services approaches as exists between the gangs themselves.

Globally speaking, the line between the definition of “gangs” and “organized crime” is less clear. While most use the Europol definition of a gang, which largely parallels the definition given at the beginning of this chapter (see also Klein 1995), the literature consulted for this piece did not always follow it closely when differentiating between gangs and organized crime. This was especially evident between scholars from different countries who seemed to blur the two, particularly in cases where state sanctioned violence was also intimately involved (Van Reisen and Mawere 2017; Adepoju 2005; Ryazantsev et al. 2015). This has implications for international responses, particularly in cross-border cases where organizations may also be taking advantage of gaps in the interstate system such as lax borders, briiable officials, or lax financial controls between certain countries to facilitate operations and increase profits (Williams 2008). Understanding the differences in motivations, methods, and the environments in which different types of gangs perpetrate sex trafficking can make a big difference in curtailing gang trafficking activity.

Abstract

Human trafficking is an important humanitarian issue that demands continued attention from the international community. A review of the available literature in relation to human trafficking reveals a clear emphasis in regard to understanding and documenting the issues related to the trafficking of adult females and children. Although it may be argued that there is clear evidence supporting the prioritization of investigating the human trafficking of females and youth, it may also be argued that the investigation of adult male trafficking is comparatively lacking in terms of systematic and empirical attention. This chapter, therefore, aims to explore the issue of adult male human trafficking through the lens of the forgotten few. Through a review of the current literature, this chapter will attempt to clarify what we currently know in relation to the experience of adult male victims of trafficking, the motivations underlying this practice, and the range of specific issues related to trafficked men across a variety of jurisdictions. It is argued that sustained research into the trafficking of men is required to illuminate the forms of exploitation they are exposed to and to inform the development of effective policy and practice to ensure their protection.

Males · Adult · Slavery · Forced labor · Trafficking

The traditional notion that human trafficking is primarily a sex crime against females harms the collective good by facilitating the neglect of hundreds of thousands of male victims who suffer from sex crimes or forced labor – Jones (2010 pp. 1146)

Introduction

Human trafficking is an important humanitarian issue that is recognized as a global problem impacting an estimated 20.9 million people worldwide (International Labor Office 2012). The breadth of this issue has led to a significant amount of international attention directed toward gaining a better understanding of human trafficking in regard to (1) victim demographics (e.g., who they are, where they are from, where they are transported to), (2) the motivational factors driving the practice (i.e., gaining a better understanding of why individuals commit human trafficking offenses), (3) the strategies for assisting with the investigation and prosecution of the practice, and (4) developing policies and programs to better assist the victims (UNODC 2016).

Interestingly, however, a review of the existing literature appears to indicate that although a significant amount of research has been conducted on the trafficking of adult females and children (both male and female), comparatively little attention has been directed toward understanding the issue of human trafficking as it relates to adult male victims (Godziak and Bump 2008; Jones 2010). It should be acknowledged that there are important and identifiable reasons for the lack of parity in attention paid to adult males when compared to adult females and children. For
instance, global statistics indicate that adult females are by far the most common group of human trafficking victims (UNODC 2016). Furthermore, statistics consistently suggest that children are also far more likely to be identified as victims of trafficking than adult males (US Department of State 2017). It has also been argued that the lack of attention may be, at least in part, due to the general belief that adult males are less vulnerable and less likely to be exploited or become victims of trafficking (Hebert 2016; Tien 2013).

Despite the above it is important to also acknowledge the existing and growing evidence of adult male trafficking and encourage the global community to invest in research and the subsequent development of interventions to assist this population. It may be argued that the current lack of accurate information may be contributing to the perceived magnitude of the problem and obstructing the development of appropriate responses. If left unattended, adult male victims may experience increased negative consequences due to a lack of responsive policies, laws, and support services (Tien 2013).

In order to assist with closing this gap in the literature, this chapter will explore the current knowledge base regarding the trafficking of adult males. Particular attention will be paid to clearly documenting the demographics related to this issue (i.e., who is being targeted), identifying the motivational elements underlying the crime (i.e., why adult males are targeted), and reviewing the policy and practices that have been developed to address this situation. It is also hoped that this chapter will provide impetus for a more intensive and comprehensive discussion around how the global community may increase its capacity to assist adult male victims of human trafficking. Specifically, it is suggested that any progression toward more effectively meeting the complex and unique needs of adult male victims must begin with (1) working toward a global definition of adult male trafficking, (2) gaining an understanding of the specific types of adult male trafficking which occur internationally, (3) identifying and implementing systematic processes for recording the incidences and particulars of adult male trafficking both intra-jurisdictionally and inter-jurisdictionally, and (4) the need for the developing effective policies and support systems designed to assist adult male victims of human trafficking. It is argued that these foundational elements are paramount to ensuring that the international response to adult male trafficking is empirical, strategic, and coordinated.

**Defining and Contextualizing Adult Male Trafficking**

Over the past few decades, interest in human trafficking has increased substantially (Hebert 2016). However, despite this surge the experiences of men and boys are rarely featured in the media, academic writing, and activist campaigns, distorting our conceptualization of victims and concealing the male victims of human trafficking. In her review of the extant literature, Hebert noted that of 651 articles relating to the trafficking of humans, only 20 (3%) were primarily focused on male victims of human trafficking and of these more than a third related to child soldiering. A similar lack of acknowledgment and attention was also identified by Dennis (2008) in his
review of existing sex trade research. Of the 161 articles identified for review that were published between 2002 and 2007, only 10% of these articles focused on men with most articles failing to acknowledge the existence of male sex workers. Hebert argued that the archetype of human trafficking is so deeply embedded in our collective conscious that trafficked persons who are not female victims of sexual exploitation are barely seen or counted. Hebert also highlighted that the concept of male victimhood is, within many cultural contexts, at odds with society’s understanding of the privileged and often powerful position of men, making it difficult to conceive that men can be victims of coercion and exploitation. Hebert emphasized that it is imperative that we begin to acknowledge their vulnerability as they represent a considerable proportion of those that are trafficked. Furthermore, neglecting to do so directly impacts our ability to develop effective and inclusive laws and policies that can protect and support victims of trafficking.

A review of the existing literature on adult male trafficking indicates that, compared to our empirical knowledge of adult female and child victims, there is a clear lack of information relating to the definition and contextualization of this issue. The need for a specific definition for adult male trafficking is underscored by international data indicating that although the majority of trafficking victims are adult females and girls (UNODC 2016), the profile of trafficking persons appears to be changing. More specifically, males have begun to make up a larger and ever-increasing proportion of those identified as trafficking victims (US Department of State 2017). Although it may be argued that this shift is partly due to increased global understanding and awareness about the issue of adult male trafficking as well as changes in the way trafficking is conceptualized by the international community, it highlights the importance of ensuring a global definition is employed.

It may be argued that early definitions of human trafficking largely overlooked adult male victims and the forced labor trade, instead focusing more directly on females and the issue of sexual exploitation (Sylwester 2014). These early definitions often specified women and children as trafficking victims, overlooking the fact that adult males may also be victims of this crime (Tien 2013). According to the literature, it appears that adult males were often considered simply within the context of forced labor discussions and males working within the illegal sex trade were often perceived as willing participants rather than as potential victims of exploitation (Figlewski and Brannon 2013). Among other things, this conceptualization of adult males as invulnerable to exploitation has resulted in male victims often not being afforded the same protections available to adult female victims, leaving them in the dark, exposed, and without a voice (Hebert 2016).

Given the above situation, it is not surprising that adult male victims are more likely than adult females and/or children to find themselves penalized, fined, detained, or deported without provision of adequate support when coming to the attention of authorities (US Department of State 2017). It is only recently that adult male victims have been legitimized and considered as potential victims in need of protection and support (Jones 2010). This legitimization can be seen, for example, in the very purposeful use of gender-neutral language used within the Traficking Victims Protection Act (TVPA), one of the most important anti-trafficking laws to
be passed in recent times. It can also be seen in the United Nations 2009 report on human trafficking in which it states that trafficking in males is rarely represented in official national statistics (Jones 2010). Although the move to legitimize these men is a step in the right direction, there remains little global consensus on how to effectively identify, protect, and support male victims.

As formal acknowledgment of this group of victims increases, the need for a clear universal definition becomes increasingly important. Men are often omitted from trafficking data due to lack of acknowledgment as potential victims, making current statistics highly inconsistent and often unrepresentative concealing of the true size of the problem. For example, in 2006 the Department of Justice recognized that the data on adult men were excluded from trafficking estimates (Jones 2010). As we move toward the development of a definition of adult male trafficking, it is important to note that contemporary definitions of human trafficking frequently involve reference to the recruitment, movement, and exploitation of people (Sylwester 2014; UNODC 2016). However, establishing a global age of majority to incorporate into such a definition may be more controversial. Although the age of majority continues to differ between nations, most nations consider 18 years of age as being the commencement of legal adulthood. As such, in line with the definition of human trafficking afforded by the UNODC, adult male trafficking may be defined as “any situation that involves the recruitment, movement or harbouring of males, 18 years or older for exploitative purposes, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for exploitative purposes.”

Once a global definition is finally adopted, we can then begin to move toward increasing our ability to better identify the data related to the definition. Currently, there is no true consensus in relation to the number of adult male victims around the world and even less systematic documentation regarding the experiences of this cohort. In 2014, the United Nations Office on Drugs and Crime (2016) reported that 21% of detected victims of trafficking were male. Furthermore, the report indicated that the number of males identified appears to be increasing (see Table 1). Statistics indicate that the trafficking of males is not a regional phenomenon, with accounts of male trafficking observed all around the world. The percentage of males among identified trafficking victims by global region in 2014 can be seen in Table 2. According to the UNODC, 53% of male victims identified in 2014 were within Eastern Europe and Central Asian regions, with an additional 34% identified in North Africa and the Middle East. However, the UNODC reported that the high rates observed in North Africa and the Middle East may be linked to frequent detections of trafficking for forced labor across these two regions.

It should be acknowledged that these statistics can be misleading as they only provide a snapshot of the problem of human trafficking in relation to identified victims and do not account for those individuals that are not formally identified as victims. Interestingly, it appears that adult male victims are often overlooked despite clear evidence that it is a human rights violation impacting a substantial number of both men and boys (Surtees 2008). The most frequently cited global statistics
regarding human trafficking indicate that men and boys likely make up almost half the number of human trafficking victims (US Department of State 2017). Despite this, the identification and care of male victims remains a substantial global challenge.

Identifying the Specific Types of Adult Male Trafficking

Although numerous types of adult male trafficking have been identified, a review of the international statistics (see Table 3) related to this issue indicates that forced labor may be the most common form (Tien 2013). More specifically, it has been estimated that adult males comprise nearly two thirds of forced labor victims in common low-skilled labor sectors (Pocock et al. 2016). Between 2012 and 2014, for example, it was estimated that 63% of trafficking victims for the purposes of forced labor were male (Tien 2013). Review of the literature indicates that trafficked men engage in a range of forced labor contexts, most commonly in the fields of construction, agriculture, fishing, and mining (see Chap. 101, “Labor Trafficking of Men in the Artisanal and Small-Scale Gold Mining Camps of Madre de Dios: A Reflection from the “Diaspora Networks” Perspective”). However, according to the US Department of State (2017), adult male victims of forced labor have been found in nearly all work sectors, suggesting that this crime may be expanding beyond the initial low-skilled labor sector.

The above statistics are particularly concerning as they may also be confounded by the fact that adult male forced labor is an extremely underreported form of trafficking, making it particularly difficult to ascertain the true extent of the problem (Tien 2013). Although there are likely to be numerous explanations for the underreporting of forced labor as a form of human trafficking, it has been suggested that this underreporting may be at least partly due to the fact that (1) the criminalization of forced labor is a relatively new global development, (2) both the public and

law enforcement tend to relate human trafficking to sexual exploitation, (3) male victims when identified are often deported without consideration of being a victim of trafficking, and (4) forced labor is often difficult to detect due to the fact that it often occurs outside of the public eye (Tien 2013).

In addition to forced labor, a number of other types of adult male trafficking have been recently identified. For example, according to the UNODC, 6.8% of adult male victims identified in 2014 were victims of sexual exploitation. Although this may seem a small proportion of those identified, it has been argued that the sex trafficking of both adult men and young males remains obscured and underreported (Dennis 2008). However, there is evidence to suggest that the sex trafficking of males may occur in many countries (US Department of State 2017). According to Figlewski and Brannon (2013), in some countries the practice of keeping boys or young men can be seen as common and tolerated. In the United States, men have also been identified as victims of trafficking for sexual exploitation. In a study conducted across New York City examining commercial sexual exploitation, the research team reported expecting to attain a largely female sample through a snowball sampling technique. However, they were surprised to attain a sample consisting almost half of adult males (48%) suggesting that the commercial sexual exploitation of males may be more prevalent than they first imagined. The findings of the qualitative interviews conducted with these men suggested that homosexual or bisexual young adult males and boys may be particularly vulnerable to commercial sexual exploitation. According to Jones (2010), adult males and boys experience the harm of trafficking acutely because of gender structures and pressures imposed on them, assumptions that they always desire sex and the fact that they are less likely to report trafficking.

In addition to the above, there is some indication that other types of adult male trafficking are emerging. For example, statistics suggest that adult males make up the vast majority of identified victims of trafficking for the purpose of organ removal. Between 2012 and 2014, 82% of people identified as being victims of trafficking for organ removal were adult males (UNODC 2016). According to Yea (2015), adult male victims often find themselves trafficked for organ removal due to their economic vulnerability and their desire to attain financial security for their families. There is also some evidence of adult males being trafficked for domestic servitude and forced begging (US Department of State 2017).

**Recording Adult Male Trafficking Internationally**

Over the past two decades, there has been an increase in research focus toward adult male victims of human trafficking. Consequently, there have been a number of noteworthy publications that have detailed and discussed the issue of the trafficking of men. This section provides a simple summary of some of the recent research and statistics that have emerged from across the globe. This is an important preliminary step toward the eventual development of cross-jurisdictional strategies and initiatives aimed at impacting this phenomenon.
Europe

Surtees (2008) compiled a report examining the human trafficking of adult males in Belarus and Ukraine. According to the report, male victims comprised 28.3% and 17.6% of the International Office of Migration (IOM) assisted caseload in Belarus and Ukraine, respectively, between 2004 and 2006 (Surtees 2008). Of this sample, the men ranged in age from 18 to 44, with two thirds of the Ukrainian males being married or living with a partner prior to being trafficked. One third of the trafficked Belarusian males were married, and half were single. According to the report, at least half have children, and many cited the need to support their children as a reason for migration. The vast majority were recruited with promises of employment, and the men reported the processes appeared to be in line with legal migration processes, many making what they believed were legally binding agreements with an agency or recruiter. Most were trafficked for forced labor, and the primary destination for men from both countries was Russia.

United Kingdom

A few reports have emerged that have attempted to document and detail the experiences of trafficked men in the United Kingdom (UK). In a recent report by The Salvation Army (2017), it was estimated that between June 2016 and July 2017, The Salvation Army supported 1002 female and 549 male victims of modern slavery in the United Kingdom suggesting that around half of identified victims in the United Kingdom are male. This is largely in line with statistics attained by the National Crime Agency (2017) who reported that of the 5145 referrals of potential victims received by the National Referral Mechanism (NRM), 52% were males. According to the report, the majority of adult males referred to the service were trafficked for labor exploitation.

Southeast Asia

As with many other global regions, research exploring the trafficking of men in the Southeast Asian region is sparse (Kiss et al. 2015). Although there are many explanations for the lack of research into the phenomenon, it should be noted that in some Southeast Asian countries, adult males have only recently been acknowledged as potential victims of human trafficking (Feingold 2005). For example, it was only in 2009 during the fifth session of the XII National Congress, Vietnam revised Article 119 of the Penal Code to include wording that allowed males to be considered as victims of trafficking (Tucker et al. 2009). In a report published by the Australian Institute of Criminology (Larsen et al. 2013), examining data from the International Organization for Migration (IOM) Counter Trafficking Module Database, 10% of identified trafficking victims within Indonesia were male. According to
the report, the majority of males and females were recruited via agents; however, males were more likely than females to have been recruited by a family member.

Kiss et al. (2015) conducted a study in which they interviewed 1102 identified victims of trafficking across Thailand, Cambodia, and Vietnam. Of the 1102 participants in the study, 29.85% were male (n = 303). According to their findings, adult males were mainly exploited in fishing and factory settings, with more than half in trafficking situations for 7 months or more. Almost half the men reported physical violence (49.1%) and working more than 10 h per day, and 73.1% reported extreme restriction of movement. Compared to the reports made by women and children, a higher proportion of men reported experiencing poor living conditions, weight loss, and memory problems. Furthermore, many men reported experiencing depressive (60.7%), anxiety-related (48.4%), and post-traumatic stress symptoms (46.3%). It should be noted, however, that only individuals who had utilized post-trafficking services were interviewed as part of this study and interviews were not conducted with individuals that were deemed by caseworkers as too unwell to participate. In a more recent study of 446 male trafficking victims in the Southeast Asian region, Pocock et al. (2016) found that 35.5% of male victims had been injured while trafficked and 29.4% reported receiving no personal protective equipment. The most common injuries reported were deep cuts and skin injuries for which fewer than a quarter reported receiving medical care.

These findings are echoed in Sylwester’s study examining the trafficking of men from Myanmar to Thailand to engage in forced labor. Sylwester (2014) documented the experience of 14 men promised employment in factories with good conditions only to be subjected to 6 months unpaid work aboard 3 Thai fishing vessels. These men endured 24 h working days and physical assault and witnessed the murder of a fellow laborer. According to Sylwester, the influx of Myanmarese fleeing political persecution has met the demand of the Thai fishing industry’s need for cheap labor, with Human Rights Watch estimating that at least 250,000 migrants from Myanmar work within the Thai fishing industry. This is also true within the construction industry and other industries that rely on cheap labor to be profitable. Sylwester argues that there are particular factors that may make these individuals more vulnerable to exploitation. Specifically, being migrants and being male, they easily fall outside of regulatory oversight and conventional protections for human trafficking victims (Sylwester 2014).

Forced labor, however, is not the only reason for the trafficking of men throughout the Southeast Asian region. Trafficking for the removal of organs is a substantial illegal market that disproportionately impacts adult males. Despite the seriousness of this issue and the fact that men are particularly vulnerable to this type of trafficking, there is very little research that explores the issue of trafficking for organ removal purposes as it relates to adult males. In one of the few studies examining victims of trafficking for the purpose of organ removal, Yea (2015) described the plight of economically marginalized Filipino men who engage in the organ removal process often to attain some level of financial security for their families. Unfortunately according to Yea, the process regularly results in only short-term financial gain and long-term health complications.
Africa

South Africa is one of the few African nations that can be considered primarily a destination country for trafficked men, women, and children (US Department of State 2017). According to Allais (2013), however, reports of male trafficking victims in South Africa are arguably rare as men have traditionally been overlooked as potential victims. This lack of trafficking reports does not infer that the trafficking of men is uncommon in the African region but is more likely indicative of the lack of identification of male victims. In a report for the IOM, Horwood (2009) concluded that there was little clear evidence of the trafficking of men from East Africa or the Horn of Africa to South Africa. However, the research did highlight the large-scale smuggling of men, as well as allegations of severe human rights violations and exploitation.

The distinction between smuggling and trafficking is arguably slight, with the main difference being that individuals who are smuggled across a border have procured services to assist in the illegal entry. Some trafficked persons, however, might begin their journey agreeing to be smuggled only to be deceived, coerced, or forced into an exploitative situation upon arrival. Alternatively, a trafficker may offer services that appear to be smuggling to potential victims while intending from the outset to exploit them. Although Horwood’s distinction between these terms in the report may be accurate in the case of the movement of men from East Africa and the Horn of Africa to South Africa, the observation and recording of severe human rights violations and exploitation suggest a similar trajectory and level of impact as experienced by trafficked men elsewhere around the globe.

Examination of the little data available in regard to African men indicates that the vast majority of these victims are trafficked for forced labor in construction, agriculture, fishing, and mining (Allias 2013). These findings are echoed by Bermudez (2008) in an earlier report on internal trafficking of persons in South Africa for the International Organization for Migration. The report provided evidence that men and boys were being recruited across South Africa to work on farms under false promises of pay and suitable accommodation. According to the report, migrant men from Mozambique and Zimbabwe were found to be particularly vulnerable and prone to exploitation. These men were considered particularly vulnerable due to their low economic status and lack of official documentation. It should be noted, however, that South African nationals were also targeted, particularly those residing in regions of endemic poverty. Allais (2013) also highlighted that identifying appropriate support services for trafficked men is particularly challenging as existing victim support services in Southern Africa focus almost exclusively on women and children and little sustained research is being conducted that examines the experience of male victims in Africa.

Responding to the Needs of Adult Male Trafficking Victims

What is abundantly clear from the available literature is that victims of trafficking are at a heightened risk of experiencing a wide range of negative physical and psychological conditions associated with their exploitation. High rates of depression,
anxiety, and post-traumatic stress disorder (PTSD) have been identified in surveyed male survivors. Furthermore, it is common for male survivors to report substantial physical injuries and health concerns, with one study finding 21% of the male survivors surveyed reporting ongoing injuries and 8% reporting diagnosed sexually transmitted diseases (Oram et al. 2016). Forty percent of the men in this study reported high levels of depression, anxiety, or post-traumatic stress disorder symptoms. Unfortunately, it has been argued that current services designed to respond to the need of trafficking victims are not effectively catering for the unique needs of adult males (Omole 2016).

As with all complex social problems, however, there are several barriers to providing protection and care of adult male trafficking victims. Omole (2016) argued that the global issues of poverty, unemployment, social inequality, and globalization all present significant challenges to stopping the illegal trade of humans. However, in the case of adult males, there are arguably less complex barriers that may impede the effective support of these victims. These include but are not limited to a lack of accurate statistics, failure to effectively identify male victims, lack of redress, general suspicion of innocent male victims, a lack of tailored programs for men, and a lack of training for health professionals to help these men (Jones 2010).

Attaining robust global statistics is hampered by the hidden nature of trafficking crimes, global events, shifts in government policy, and a lack of uniformity in national reporting structures. Without effective accounting, it is particularly difficult to implement targeted responses with any real confidence that services and policies will result in positive outcomes for male victims of trafficking. Establishing a clear, standardized, global definition of male trafficking would assist in the collation of more accurate and robust statistics that can inform national and international responses.

There are several ways that we as a global community may be able to counter the challenges faced in regard to the trafficking of adult males. For example, the effective identification of adult male victims can be increased by assisting community and health professionals to raise their awareness of the plight of trafficked men (Hemmings et al. 2016). In one study surveying health professionals in the United Kingdom, 95.3% of participants reported being unaware of the scale of human trafficking in the United Kingdom, with 76.5% also reporting being unaware that calling the police could put victims in more danger. In a systematic review of the existing literature, Hemmings et al. (2016) found that there were several potential indicators of exploitation that health professionals should look out for including signs of physical/sexual abuse, inability to speak to local language, absence of official documents, fear of deportation, inconsistencies in presentation (e.g., dates, names, and addresses), and attending with a controlling companion. The review suggested that to encourage disclosure, health professionals should ensure individuals are assessed privately, that interpreters are engaged where possible, and that health professionals build trust with potential victims of trafficking. In relation to the provision of care, the review suggested that health professionals take a trauma-informed and culturally sensitive approach to working with potential victims, conduct comprehensive health assessments, and collaborate with law enforcement and relevant support services. There is some evidence to suggest that when concerted and
sustained efforts have been made to increase awareness in regard to the plight of trafficked men, the identification of trafficked males has increased (Tien 2013).

Unfortunately, the general lack of awareness and understanding of trafficked men observed within the health sector has meant that current support services are rarely tailored to the unique needs of trafficked men (Tien 2013). Those working in healthcare professions and other social professional roles need to be educated regarding how a trafficking victim may present and relating to their unique care needs (Barrows and Finger 2008). However, research emerging from the United Kingdom examining national healthcare professionals found that 71% of respondents lacked confidence in making appropriate referrals for men who had been trafficked (Ross et al. 2015). In response to this lack of health professional knowledge, there have been calls to increase the training of health professionals (Hemnings et al. 2016) and integrate curricula on human trafficking into medical education and residency training programs (Grace et al. 2014).

Research aimed at informing practice and policy is also hampered by the lack of assessment tools designed to cater for trafficked men and women. In fact, review of the literature indicates that there is a shortage of validated and culturally appropriate assessment tools available for mental health research with trafficked men (Doherty et al. 2016). Without such tools there will likely remain a lack of evidence to inform mental health service provision.

**Conclusion**

In summary, although many governments have made positive progress toward improving their responses to the issue of male trafficking, there is still a long way to go before services, policy, and law can be considered effective and truly responsive to the phenomenon. Until recently, male victims of human trafficking have been largely neglected, not identified in current statistics and not adequately covered in definitions of trafficking nor by anti-trafficking laws or by reactive support services. Male victims are often not identified by health professionals, and many men may have difficulty self-identifying as victims. It is imperative that male victims are provided culturally appropriate and specifically tailored support to meet their needs including housing, medical care, mental health support, and legal representation. The global community needs to begin to develop clearer strategies aimed at protecting, assisting, and supporting male victims of human trafficking, or they will simply remain the forgotten few in the fight against the illegal trade of people.

Abstract

In January 2019, it is twenty years since the law that prohibits the purchase of sexual services came into force in Sweden. The introduction of this legislation was the conclusion of many years of struggle by the Swedish feminist movement to integrate a feminist analysis into the legal and policy framework on prostitution and trafficking in human beings for sexual purposes and ultimately to visibilize and denounce the behavior of men, who purchase and sexually abuse women and girls through prostitution. The chapter provides an overview of the current legal, policy, and strategical framework on prostitution and human trafficking for the purpose of sexual exploitation in Sweden, while giving insights into the current jurisprudence and historic events. It also aims to give an understanding about what a gender equality approach entails and counteracts some of the criticism that has been directed toward Sweden by pro-prostitution advocacy groups since the introduction of the legal and policy actions to discourage the demand.

Introduction

This chapter describes the development in Sweden toward a gender equality-based approach to prostitution and trafficking in human beings for sexual purposes, and provides a comprehensive overview of the legal, policy, and strategical framework with a focus on measures that aim to discourage the demand. Part one of the chapter presents the offence that prohibits the purchase of a sexual service, discusses core aspects of the definition of the offence, and gives examples of the relevant jurisprudence. Part two discusses the importance of situating the struggle to eliminate prostitution and trafficking in human beings for sexual purposes in a feminist analysis. The third part of the chapter explores the current situation in Sweden, twenty years after the introduction of the prohibition on the purchase of a sexual service and provides core data on its implementation. The fourth part of the chapter presents and refutes some of the criticism that has been directed toward the Swedish approach by pro-violation groups. Finally, the chapter presents the key features that guarantee that a gender equality-based approach to prostitution and trafficking in human beings for sexual purposes can be sustained over time.

In May 1998, the Members of the Swedish Parliament voted to pass a Government Bill, the Anti-Violence Act – “Kvinnofrid,” which included a large number of measures in law and policy to prevent and eliminate violence against women (Government Bill 1997/98:55).

The Government Bill was a core part, long in coming, of the ongoing work toward gender equality in Sweden and, in many ways, the peak of over twenty
years of feminist advocacy by the Swedish women’s movement to end oppression of women in the private and public spheres. This activism was reflected in the Government Bill:

Male violence against women is not compatible with the efforts towards a gender equal society and must be tackled in all ways possible.

In addition to new offences that criminalized male violence against women in intimate relationships, a stronger rape offence, and more effective legislation against sexual harassment at work, the majority of the Members of Parliament also voted to adopt a number of comprehensive measures to prevent and eliminate prostitution (Protokoll 1997/98:114). As was explained in the Government Bill:

In such a [gender equal] society, it is also against human dignity, and unacceptable for men to obtain casual sexual relations with women for compensation. (Government Bill 1997/98:55 at 22)

As a result, on 1 January 1999, the law that prohibits the purchase of sexual services came into force (Lag 1998). The law, which was integrated into the Penal Code in 2011 as an offence under its chapter on sexual crimes, is phrased in simple, but unambiguous terms. It states that:

A person who, in other cases than previously stated in this chapter, obtains a casual sexual relation in exchange for payment shall be sentenced for the purchase of a sexual service to a fine or imprisonment for at the most one year.

What is stated in the first paragraph also applies if the payment has been promised or made by someone else (Penal Code, Chapter 6, Section 11).

**Definition**

In 2004, the Government explained that a “casual sexual relation” means “intercourse and other forms of sexual relations” (Government Bill 2004/05:45). This was further clarified in a court case from 2012, involving a 41-year-old man. The accused had unbuttoned his trousers and started to touch a prostituted woman when the police approached his car and arrested him. His action was considered a “casual sexual relation,” and he was convicted for the offence of the purchase of a sexual service (Stockholms tingsrätt 2012a at 3).

**Sites of Application**

The offence applies to all forms of sexual services, whether they are purchased in street prostitution, in apartment brothels, in a hotel or a massage parlor, in the home of the prostitution user, or in other similar circumstances.
Attempts to Purchase a Sexual Service

Importantly for the successful enforcement of the legislation, the courts agreed that attempts to purchase a sexual service are also punishable under the criminal law provision, and have convicted such prostitution users for the purchase of a sexual service. For a prostitution user to be considered responsible for an attempt, he must have initiated the commission of the crime, and there must be a danger that the crime would be completed (Hovrätten över Skåne och Blekinge 2002, 2000 at 4).

In a 2012 case, the Stockholm District Court provided one example of what is considered an attempt to purchase a sexual service:

Both police witnesses declared that XX [name redacted] told the female police officer that he wanted to have sex, and then asked her how much it would cost. No circumstances have emerged that give reason to question the reliability of this information. It is, thus, confirmed that XX attempted to buy a sexual service. . . . XX will therefore be sentenced in accordance with the charge. (Stockholms tingsrätt 2012b at 3)

Another example in the jurisprudence of attempts that have been successfully prosecuted is when a prostitution user paid for a sexual service but had not yet initiated the casual sexual relation (e.g., Solna tingsrätt 2012 at 3). The same year five more men, who attempted to purchase a sexual service in similar circumstances, were convicted in different courts across the country.

Aiding and Abetting

Since 2004, the offence also criminalizes the act when a third person or group of individuals purchase a sexual service for someone else. This situation can, for example, occur when a sexual service is offered as a gift to a future groom in the context of a stag party or when corporations offer a sexual service as a business benefit for male business associates. So far, no businesses have been implicated in such action, which is not a guarantee that these situations do not occur.

The courts have convicted several individuals for the crime of aiding and abetting a purchase of a sexual service. A typical situation is when a friend ordered (with the knowledge and agreement of the prostitution user), booked, requested delivery, or picked up and transported a prostituted woman to the main perpetrator for the purpose of exploitation in prostitution or accompanied the main perpetrator to the location of the prostituted woman. In several of these cases, the argument of the aider and abettor is that the main perpetrator either was “too shy,” did not speak the language understood by the prostituted woman, or that he did not know how to gain access to women in prostitution. So far, the courts have not considered such actions as aggravating circumstances. As a result, the penalty has been negligible; usually set at the lowest level of day fines. One example on point is a case determined in 2011, where a man living in the Swedish northern border town of Haparanda requested that a male friend travel to the town of Keminmaa in Finland, a well-known prostitution location, “to pick up and bring back a woman.”
The lower court convicted the male friend of procuring because he had benefitted economically by ensuring that another person could have a casual sexual relation, but suspended the sentence with a fine (Haparanda Tingsrätt 2011 at 6). The male friend appealed the decision. The Appeals Court for Northern Norrland struck down the verdict for procuring, but concluded that:

[the retrieval and transport of the woman to XX’s home contributed significantly to the commission of the crime. Therefore, this act is not a minor infraction. Consequently, XX cannot escape responsibility for aiding and abetting the purchase of a sexual service. The penalty for [the male friend] should be determined to a low number of day fines. (Hovrätten för övre Norrland 2011 at 6)]

**Penalties for the Purchase of a Sexual Service**

The courts pronounced early on about the penal value for the purchase of a sexual service, taking into consideration “the harm, the indignity and the danger that was caused by the act when assessing the penal value for an offence” (Penal Code, Chapter 29, Section 1).

In 2001, the Supreme Court of Sweden upheld the decision of the Court of Appeal for Skåne and Blekinge, in a case from 1999, that the minimum level of fines for a regular purchase of a sexual service should be set at fifty day fines (Högsta domstolen 2001 at 2). The number of day fines indicate the seriousness of the crime, and their size is adapted to the financial situation of the offender.

This case involved a man in his early thirties, who paid SEK 300 for a blow job, which the prostituted woman had to perform while in his car (Malmö tingsrätt 2000 at 2). The decision by the Supreme Court, which was precedent setting, has been criticized, in particular by Swedish feminists, as being regressive and underplaying the seriousness of the harm to the prostituted woman. The decision, they argue, is based on outdated attitudes, where the prostituted woman, not the man that purchased and sexually exploited her, is apportioned the blame.

In its judgment, the Appeals Court first discusses the penal value of the offence, noting that the law makers intended it to be “lower than the penal value for the offence seduction of youth,” which at the time was at the most six months in prison, and that the age and other circumstances of the victim could be considered. The Court of Appeal concluded that the penal value should generally remain the same for all breaches, and that this would include attempts to purchase a sexual service (Hovrätten över Skåne och Blekinge 2000 at 4).

The Court of Appeal supported the conclusion of the lower court that:

[It is in the nature of the law [that prohibits the purchase of a sexual service] that consent is a prerequisite for the existence of the crime. There is no indication in the law, as it is in the law against female genital mutilation, that consent does not free the perpetrator from responsibility. The way which the prohibition is formulated leads [the court to] believe that the act is not to be seen as a crime against the person, but rather as a crime against public order. (Malmö tingsrätt 2000 at 4)]
The assessment that the offence should be regarded as a crime against public order led the Court to conclude that there was no reason to further delve into the social situation of the prostituted woman, or to find out whether the perpetrator was aware of her circumstances.

The Court determined that it was “obvious that the punishment for a breach of the law in question normally should be fines,” that the penal value should be at the lower end of the penal scale, but somewhat higher than the lowest number of day fines, i.e., to be set at fifty day fines (Hovrätten över Skåne och Blekinge 2000 at 5). The Supreme Court upheld unanimously these findings, and noted that the punishment was well-balanced (Högsta domstolen 2000 at 2).

These pronouncements stand in stark contrast to the principled statement about the inherent subordination of women in prostitution by prostitution users set out in the 1998 Government Bill, and supported by the Swedish Parliament, that:

... it is not reasonable to also criminalize the individual that in most cases is the weaker part, who is exploited by others, who want to satisfy their own sexual drive. (Government Bill 1997/98:55 at 104)

In 2008, in a decision by the Court of Appeal in Western Sweden, the discussion about the appropriate penal value was further developed. The Court concluded that a purchase of a sexual service, which takes place in the context of organized prostitution (in this case, in connection with gross procuring involving four accused) is to be considered aggravated, and, hence, the offender should be sentenced to a conditional sentence and fines.

She found herself in an unknown place in a strange country, whose language she did not understand. Both men were older than her and completely unknown to her. ... [S]he found herself at such a disadvantage to the two men that it must have appeared as virtually impossible for her to refuse intercourse with the second man, or to influence the situation in general. Her situation was used by XX and XY. The circumstances are, thus, so aggravated that the punishment cannot be set at a fine. (Hovrätten i västra Sverige 2008 at 9–10)

This latter decision by the Court of Appeal has not been applied consistently to later cases with similar or same circumstances. As the Chancellor of Justice noted in her 2010 Commission of Inquiry report from the review of the effects of the ban on the purchase of a sexual service, which proposed an increase of the maximum prison sentence from six months to a year:

The current penalty level for certain purchases of sexual services does not stand in proportion to the seriousness of the crime. (Commission of Inquiry 2010 at 241)

In July 2011, through a Government Bill, the maximum prison sentence for a purchase of a sexual service was increased from six months to one year based on the recognition that:

[i]n our society, prostitution is an unacceptable phenomenon, which results in harm both to the individual and to society at large. Therefore, to prevent and combat prostitution is of
urgent societal importance. In this work, the offence that prohibits the purchase of a sexual service is an important instrument. (Government Bill 2010/11:77 at 6)

Despite this unequivocal direction from the Government, framed in established feminist and human rights principles, the courts have yet to sentence a prostitution user under the offence that prohibits the purchase of a sexual service to serve time in prison.

**Gender Equality Is a Core Element in the Struggle to Eliminate Prostitution and Trafficking in Human Beings in Sweden**

Since the beginning of the twentieth century, the international community has developed international treaties and policy agreements to prevent and combat prostitution and trafficking in human beings (e.g., through the League of Nations, the United Nations, the Council of Europe, and the European Union).

Many of the earlier international treaties, and importantly, the United Nations Convention for the Elimination of All Forms of Discrimination Against Women (CEDAW), firmly establish that prostitution and trafficking in human beings for the purpose of sexual exploitation are not just crimes against the victims, whose dignity, rights, lives and opportunities are affected, but also deeply affront efforts to create societies where women are not discriminated against, and where they can participate in all areas, at the minimum on equal terms with men (CEDAW articles 2 and 6 and General Recommendation No. 35).

The development of the Swedish approach came about as a result of the efforts of a strong feminist movement to end all forms of male violence against women and girls with the recognition that the acceptance of prostitution activities in a society subordinates the position of all women, and creates barriers to their ability to engage in the democratic process as full citizens.

Early on, feminists, whether members of the autonomous women’s anti-violence movement or active in the political parties supporting this reform, recognized that for this cultural shift to be sustainable, it was and still is not sufficient, albeit necessary, to solely focus on actions that involved criminal law reform.

As a result, Sweden was the first country to fully integrate a comprehensive gender equality and human rights approach, in popular terms today named the Nordic Model, into the work against prostitution and trafficking in human beings for sexual purposes.

In Sweden, it is understood that any society that claims to defend principles of legal, political, economic, and social equality for women and girls must reject the idea that women and children, mostly girls, are commodities that can be bought, sold, and sexually exploited by men.

To do otherwise is to allow that a separate class of ...women and girls, who are economically and racially marginalized, is excluded from these measures, as well as from the universal protection of human dignity enshrined in the body of international human rights instruments developed during the past 50 years. (Ekberg 2004 at 1188)
Implementation of the Swedish Approach to Prevent and Combat Prostitution and Trafficking in Human Beings

The successful introduction and twenty years of enforcement of the offence that prohibits the purchase of a sexual service has been accepted as the ultimate proof that a cultural shift in patriarchal societies is possible, with long-reaching effects on the debate about criminal law reform in many countries around the world. However, the work to prevent and eliminate prostitution and trafficking in human beings for sexual purposes in Sweden involves so much more than just the proper enforcement of a Penal Code provision, albeit a radical application of criminal law.

Background

To ensure effective, long-term progress toward substantive gender equality in Sweden, informed by the obligations under the Convention for the Elimination of All Forms of Discrimination of Women, early on, the Minister for Gender Equality was charged with the coordination of gender mainstreaming measures into all government ministries and political areas.

Substantive gender equality in this context means that:

- the identification… of power differences between men and women in society is required, no matter their backgrounds, that the discriminatory effects and impact of these power differences should be determined, and that the goal should be to transform these conditions, rather than solely secure equal rights.
- It also means that women have a right to differential treatment when a law, policy, strategy or action that on its face is gender neutral, has a disproportional and disadvantageous impact on women. (Ekberg 2016)

In the early 2000s, this responsibility was expanded to also include the coordination and oversight of the development of the Swedish approach to prevent and eliminate prostitution and trafficking in human beings. The Swedish Government appointed a special advisor on prostitution and trafficking in human beings based in the Government Division for Gender Equality. The advisor was charged with the task to develop and coordinate a multitude of actions within the Government ministries, but also with the responsible statutory agencies, including the National Police Authority, and with specialized social services agencies, women’s equality-seeking associations, and other civil society and human rights organizations, and to oversee their implementation.

Hence, between 1999 and 2007, concerted work was carried out to implement not just the legislation but also a large number of actions across all policy areas to ensure systemic, normative, and practical changes aiming toward a gender equal society of substance where “[n]o woman or girl is for sale, and no man or boy buy another person for sexual purposes” (Winberg 2002). Politically, the work to prevent and eliminate prostitution and trafficking in human beings for sexual purposes was, and
still is, twenty years later, part of the overall actions, through laws, policies, strategies, and concrete measures to ensure and mainstream substantive gender equality in Sweden.

What Is the Situation in Sweden Today, Twenty Years After the Introduction of the Prohibition on the Purchase of a Sexual Service?

Today, twenty years after the watershed moment in May 1998 when the Swedish parliament overwhelmingly voted to criminalize those who purchase sexual services, the approach is generally working well.

Who Are the Men that Purchase Sexual Services?

The characteristics of the men and boys that encourage and sustain prostitution activities in Sweden through their purchases or attempts to purchase sexual services in Sweden have mostly remained the same over time, with some changes to their age span and ethnic backgrounds, reflecting changes over time in demographics in Sweden as a whole. Law enforcement agencies make no difference based on social, economic, or professional status in how they investigate and pursue men that purchase a sexual service. Hence, since 1999, men from all economic, social, and ethnic backgrounds have been apprehended, fined (if they plead guilty), prosecuted (if they do not), and convicted.

A long list of men in high-status professions have broken the law by purchasing and sexually exploiting mostly girls and women, but also young men and boys. This list includes a number of judges at all court levels, of which one was a Supreme Court judge at the time of his arrest. Others include a chief prosecutor, several soccer, ice hockey, and other sports stars, parliamentarians from all parties, priests, other men in clerical positions, medical doctors, teachers and school leaders, police officers and at least one high-ranking police chief, and a number of business executives including several leaders of transnational companies. And then, there are all the other men, who purchased a sexual service, who are from working and lower middleclass backgrounds with “regular jobs,” the unemployed, and those men that are on short visits from other countries, often for work purposes, and the newly arrived (National Rapporteur 2018 at 9).

The men – heterosexual and gay – are married with or without children, newly married, about to be married, cohabiting with a woman or with a man, divorced, about to be divorced, widowed, or single. Many of these boys and men find inspiration to purchase and sexually exploit women and girls through their regular use of pornography (Unizon 2016).

Research shows that a majority of the Swedish men, who have purchased or attempted to purchase sexual services, have done so on one to three occasions, whereas ten percent of the prostitution users have purchased a sexual service on
more than ten occasions, most often in connection with job-related travels (Svedin et al. 2012 at 5).

A large number of men stated that their latest purchase of a sexual service took place outside Sweden, and Swedish men are still regular sex tourists on industrialized prostitution markets in countries such as Thailand, and in cities in Europe where prostitution activities are tolerated or legalized, and the behaviors of prostitution users are encouraged (Sweden’s Fair Travel Network 2018). Since 1999, more than 7500 men and boys have been reported for having purchased a sexual service from an adult, mostly women, and another 1700 men and boys having purchased a sexual act from a child under 18 years of age (Brå 2018). Many more have been cautioned and reminded that it is, in fact, illegal to purchase sexual acts in Sweden.

\(^a\)All reported offences between 1999 and 2017 were perpetrated by men or boys.
\(^b\)The offence prohibiting the purchase of a sexual act from a child under 18 years of age was introduced in 2005 (Government Bill 2004/05:45 at 90).

The Offence that Prohibits the Purchase of a Sexual Service as a Deterrent

The 2010 review noted that the prohibition of the purchase of a sexual service acts as a deterrent for prostitution users. Individuals with experience in prostitution as well as the police and social workers conclude that prostitution users are more cautious, and that the demand has decreased considerably since the legislation came into force in 1999 (Commission of Inquiry 2010). These findings are consistent with a recent study of prostitution users in Belgium, which reported that the most effective deterrents would be legislation, information about their prostitution behavior reaching partners, and the publication of this information on, e.g., social media (Ekberg and Werkman 2016).
Survivors and Victims of Prostitution and Trafficking in Human Beings for Sexual Purposes

In 1918, after the determined lobbying over several decades by the Feminist movement of the time, the Swedish parliament voted to repeal legislation that regulated women in prostitution and allowed municipalities to administrate prostitution activities. Since then, victims of prostitution and trafficking in human beings for sexual purposes have not been criminalized, except through the use of vagrancy laws, which were repealed in the early 1960s. These laws, although frequently applied to women in prostitution, did not specifically target these women, but applied to everyone, who loitered from place to place without “earning an honest living” or who led a life which was a danger to public safety, order, or morality (Svanström 2006).

In 1995, a Government-appointed investigator produced a report in which she proposed that both prostitution users and women in prostitution should be criminalized – women, she suggested, because an offence would function as a deterrent for them to enter into prostitution and make it easier to exit once engaged (Commission of Inquiry 1995 at 30). The latter proposal was soundly rejected during the public consultation, as lacking understanding that sanctions would impede rather than support prostituted women from exiting prostitution (Government Bill 97/98:55 at 101).

Today, and although not conclusive across the country, there are strong indications that the Swedish approach has affected the number of women exploited in street prostitution. The ten year review concluded that the number of victims of prostitution and trafficking in human beings had remained stable since the introduction of the law that prohibits the purchase of sexual services (Commission of Inquiry 2010 at 35). A recent analysis by the Stockholm Regional Police Prostitution Team (SRPPT) also shows a clear decrease during the past four years. Most of the prostituted women are not residents of Sweden, with the majority being citizens of Romania, one of the poorest Member States of the European Union, and Nigeria.

Data source: National Rapporteur on Trafficking in Human Beings (2018 at 20)

Since the mid-1970s, exit services are available for victims of prostitution and human trafficking for sexual purposes in Sweden. Today, these services include sheltered accommodations, financial assistance, interpretation and psychosocial support, and specialized victim services with street-based and online outreach programs. Victims of prostitution and trafficking in human beings are also given access to court appointed lawyers, who support victims that decide to testify against the
facilitators of prostitution activities and traffickers. Third country victims can obtain temporary residence permits during investigations and judicial processes, and criminal injuries compensation is available to all victims through a dedicated statutory agency.

**Capacity Within the Justice System to Investigate and Prosecute Prostitution and Human Trafficking Offences**

The efforts of the justice system aim to prosecute the full chain of perpetrators – traffickers, pimps, and organized crime networks – with an explicit focus on the men that attempt to or purchase sexual services from adults and/or sexual acts from children under the age of 18. Since the reorganization of the police authority in 2015, six of the seven police regions have appointed specialized investigative anti-trafficking teams, with all police officers across the authority required to take part in thematic capacity building courses (National Rapporteur 2018 at 59).

In 2018, the Prosecution Authority consolidated the three existing international prosecution chambers into a National Unit Against International and Organized Crime. The National Unit is responsible for the prosecution of cross-border criminality and national organized crimes, which includes the prohibition on the purchase of a sexual service/sexual act from a child under 18 years of age when linked to human trafficking.

Data source: The Swedish Crime Prevention Council, Brå

Over the years, the legal framework that concerns prostitution and trafficking in human beings has been strengthened several times to respond better to the criminal intentions and violent actions of the men, who purchase sexual services, and to reflect the increase in “know-how” about the situation of and impact on victims. Hence, the maximum sentence for someone, who purchases a sexual service for
themselves or for someone else, was increased to one year in 2011, a reform that allows the arrest of the prostitution user and the search of his mobile phone.

In July 2018, the maximum sentence for aggravated procuring was extended to ten years in prison to reflect the seriousness of the crime when a perpetrator “make[s] a profit by ruthlessly exploiting another person, often women and sometimes children,” and offences in relation to trafficking in human beings were further strengthened (Government Bill 2017/18:123 at 13).

Today, prosecutors not only charge prostitution users under the offence that prohibits the purchase of sexual services, but also actively pursue prosecution for related crimes. An analysis by the SRPPT in 2017 concluded that 13 percent of the 144 arrested prostitution users had committed other crimes in connection with the purchase of a sexual service such as common assault, rape, unlawful threats, sexual harassment, and taking offensive and intrusive photos of women in prostitution. Of these men, 16 percent had prior convictions for a number of serious crimes including theft, assault, drug offences, fraud, drunk driving, and purchases of a sexual act from a child (National Rapporteur 2018 at 24).

A case from 2016 illustrates well this troubling development. A 21-year-old man contacted and paid for a sexual service from a young woman from Poland, who had stayed two days in a hotel in southern Sweden, during which she earned the equivalent of €1,300 from prostitution activities. During the sexual act, the man received a mobile phone call. Afterwards, when the prostituted woman escorted him to the door, another man known to the first man entered the room, dragged her to the bed and started to strangle her, while demanding to know where her money was stashed. The two men realized that the money was locked in the room safe, and demanded that the woman provide the code. When she refused, the man again proceeded to strangle her. Eventually, the men stole her money and left, and the woman asked the hotel reception staff to call the police. The court of first instance in Malmö convicted one of the men for the purchase of a sexual service, and for robbery to one year and nine months in prison. The second man was convicted of robbery and drug dealing to two years and three months in prison. Both men were required to pay damages to the woman of €4,500 jointly to compensate for the harm she suffered. The judge underlined that:

> [t]he crime she suffered involved a very serious violation of her personal integrity. She was attacked by two people when she sold sexual services, with one of the perpetrators having sexual intercourse with her as part of the criminal plan. (Malmö tingsrätt 2016 at 20)

---

**The Purchase of Sexual Services in Another Country Is Still Not Prohibited**

Not all calls for the continuing consolidation of the Swedish approach are heard or acted upon. In 2009, when the purchase of a sexual service was criminalized in Norway, the Norwegian parliament agreed — after pressures from women’s
organizations and the trade unions – that the legislation also should apply to prostitution users residing in Norway, who purchase sexual services outside the country.

Although this aspect of the offence is rarely applied (Svendsen 2011), it is clear from a 2014 evaluation of the effects of the Norwegian legislation on men’s attitudes that it, in fact, establishes a positive norm for men to abstain from purchasing sexual acts, and that “for a prostitution buyer, who gets caught, a purchase of a sexual service is seen as an enormous loss of status” (Rasmussen et al. 2014 at 13 and 66). Under the current Swedish offence, a Swedish court is only competent to sentence a person residing in Sweden for the purchase of a sexual service, which he committed in another country, when the act is also a criminal offence in that country. Women’s organizations have pressured the government to make similar changes to the Swedish offence since the Norwegian law reform in 2009. They argue that:

> [e]ven if the law has had positive effects in Sweden, we know that Swedes still purchase sex [sic] abroad. . . . Something seems to happen with the understanding of gender equality when we [sic] travel away from Sweden. (Sveriges Kvinnolobby 2014)

In October 2014, the newly elected Social Democrat/Green Party government coalition made a commitment in its Statement of Government Policies to criminalize the purchase of a sexual service by a Swedish resident outside Sweden, whether or not this country has a similar criminal law provision, and to allow prosecution of these crimes in Sweden (Regeringsförklaringen 2014 at 9). In June 2015, the Minister of Justice commissioned an earlier appointed sole investigator sitting as a Commission of Inquiry (Commission of Inquiry 2014) to consider whether individuals, who purchase sexual services outside Sweden, could and should be prosecuted in Swedish courts (Press release 2015). An interim report was presented in June 2016, in which the investigator concluded that the offence should not be exempted from the requirement of dual criminality set out in Chapter 2 of the Penal Code (Commission of Inquiry 2016 at 106). To the exasperation of the women’s organizations, the Government later retracted its commitment citing the lack of support in the Parliament. In particular, the four parties in the conservative alliance let it be known that they intended to vote down the amendment citing problems of implementation as a reason (Aftonbladet 2018a). Although more urgent than ever (Sweden’s Fair Travel Network 2018), there is no indication from the Government that the offence would be amended in the near future to allow international application.

In January 2015, the Minister of Justice commissioned an inquiry into a strong criminal law protection in cases of trafficking in human beings and the purchase of a sexual act from a child, with a sole investigator appointed in 2014 to consider whether individuals who purchase sexual services outside Sweden could and should be prosecuted in Swedish courts (Press release 2015). Although more urgent than ever (Sweden’s Fair Travel Network 2018), there is no indication from the government that the offence would be amended to allow international application.
Criticism of the Swedish Approach

The cultural shift to ensure a feminist application of laws, policies, and strategies to prostitution and trafficking in human beings for sexual purposes still draws, after twenty years of implementation, the attention of governments, parliamentarians, and advocacy groups around the world. Much of this attention is positive – over the years, many human rights advocates, politicians, law enforcement and media representatives from all corners of the world have visited Sweden to study, in situ, the impact and effectiveness of the Swedish approach. Swedish officials and community organization representatives have also travelled extensively around the world to present the results of the implementation of the legal and policy framework aimed to eliminate the demand.

But this approach has also drawn the ire of activists and academics within Sweden and across the globe that lobby for the legalization or decriminalization of prostitution activities in their own countries. A critical examination of the contemporary debate and initiatives to prevent and combat prostitution and human trafficking internationally shows a widening gap between recognized universal human rights norms and the approaches taken by certain countries, and supported by some international human rights bodies and organizations and national advocacy groups.

National Debate

This development is also reflected in the national debate about the effects and impact of the gender equality-based approach to prostitution and trafficking in human beings in Sweden. Since the beginning of the 2000s, a small number of “pro-sex work” advocates have taken active part in the media debate to denounce the Swedish approach.

One organization that has lobbied actively and consistently over the past two decades for the repeal of the offence that prohibits the purchase of a sexual service is the sex-worker organization, Rose Alliance. Rose Alliance was founded in 2003 “...as a reaction to the law that prohibits the purchase of sexual services” with the purpose, according to one of its cofounders, to become a strong lobby organization. She did, however, later underline in an interview that this purpose was never attained, due to “insufficient resources” (Skarsgård 2013).

The objective of Rose Alliance rests on six principles; two of which are directly relevant to their advocacy work. Firstly, members believe that “sex work is work and should be governed by and protected by the same labour laws as other work.” The organization is also “against all criminalisation of sexual services for compensation that takes place between consenting adults as well as being against criminalisation of third parties” (Rose Alliance Undated). Their representatives are vocal on the international arena, mostly through their membership in the Edinburgh-based Global Network of Sex Work Projects (NSWP), through research reports based on their analysis of the impact of the Swedish approach, and through their participation in...
public fora in some of the countries that have followed in or debate whether to follow in the footsteps of Sweden.

However, their impact in Sweden has been limited. There are several reasons for why their arguments have not taken hold in the Swedish debate. In 2013, it was revealed by a journalist in one of the Swedish web based dailies that the then-leader of Rose Alliance had been a member of the board of one of the few strip clubs still in existence in Sweden, responsible for the management of its work schedule, raising doubts about her integrity as an advocate for the well-being of “sex workers” (Skarsgård 2013). A significant reason for why the arguments by advocacy groups such as Rose Alliance have never taken hold in Sweden also lies in the considerable public support for the offence that prohibits the purchase of a sexual service, and the underlying principles of gender equality and human rights (Kuosmanen 2011 at 252–254).

International Debate

Other pro-prostitution advocacy groups, including several of the most respected international human rights organizations such as Amnesty International, have higher ambitions. Through their lobbying efforts on the international arena, these organizations with allies have attempted to modify the interpretation of core international agreements that pertain to prostitution and the trafficking in human beings for sexual purposes, e.g., article 6 of the CEDAW. This article recognizes that prostitution and trafficking are forms of discrimination of women, and makes it mandatory for United Nations Member States to “take all appropriate measures, including legislation, to suppress all forms of traffic in women and exploitation of prostitution of women.”

In 2016, after a membership consultation process, Amnesty International published a policy paper discussing its organizational standpoint on the obligations of states to respect and protect sex workers. In the policy paper, the organization argues not only for the importance of states to “[r]epeal existing laws and refrain from introducing new laws that criminalize or penalize directly or in practice the consensual exchange of sexual services between adults for remuneration,” but also to repeal those [laws] “which make the buying of sex from consenting adults or the organization of sex work (such as prohibitions on renting premises for sex work) a criminal offence” (Amnesty International Policy 2016a at 2 and 13).

As a result, this otherwise respected and most outspoken of the many international human rights organizations voted to reject the “Nordic Model,” aka the Swedish approach for the prevention and combat of prostitution and trafficking in human beings.

Notably, Amnesty International not only rejects outright the comprehensive work done in Sweden over twenty years to prevent and counteract prostitution and trafficking in human beings for sexual purposes. The human rights organization also disputes the multisource, verified evidence widely available that supports the positive individual and societal impacts of the Swedish approach, especially in
In its May 2016 international policy on sex worker rights, the organization outlines several reasons for why its membership firmly rejected a gender equality-based, human rights approach to prostitution and trafficking in human beings for sexual purposes, in favor of a sex work-focused approach.

The organization argues that laws that prohibits the purchase of a sexual service “can harm sex workers,” because “sex workers have to take more risks to protect buyers from detection by the police.” This argument has been soundly refuted by women and men with experience in prostitution in Sweden and in other countries, but also by the 2010 Commission of Inquiry, and in a recent European Commission report on the gender dimension of trafficking in human beings (Walby 2016 at 134).

Amnesty International goes on to state (without providing any robust evidence) that “sex workers,” who operate under a Nordic Model regime “can also face difficulties in securing accommodation as their landlords can be prosecuted for letting premises to them. This can lead to forced evictions of sex workers from their homes” (Amnesty International Q&A 2016b). This is a common criticism directed against the Swedish approach, which has been disproved by Swedish prostitution survivor groups, and repeatedly by law enforcement agencies in Sweden that, by law, may not target or otherwise criminalize women or others in prostitution.

In fact, the human rights organization aims higher than just to reject the Swedish approach; it throws its considerable ethical and political weight, with some limited reservations, behind arguments put forward by pro-violation advocacy groups that promote the legalization or decriminalization of prostitution activities:

Amnesty is not opposed to legalization per se; but governments must make sure the system respects the human rights of sex workers. . . There is no reliable evidence to suggest that decriminalization of sex work would encourage human trafficking. (Amnesty International Q&A 2016b at points 8 and 9)

However, despite these efforts to undermine the Swedish approach, their success has been limited. The gender equality-based approach to the prevention and elimination of prostitution and trafficking in human beings for sexual purposes has clearly stood the test of time, and is increasingly being adopted internationally.

What Are the Key Features that Guarantee that a Gender Equality-Based Approach to Prostitution and Trafficking in Human Beings Can Be Sustained Over Time?

The Engagement of a Committed Women’s Movement
The late 1960s and early 1970s represented a profound political transformation for women in Sweden with the rise of the autonomous women’s liberation movement. Increasingly, women became engaged in mainstream politics in order to gain
political power to affect substantive long-term positive changes to the conditions of and opportunities for women and girls.

Notably, women with experience in prostitution and survivors of other forms of male violence were closely involved in the advocacy to criminalize those men, who purchase sexual services, leading up to the positive decision in the parliament in 1998, and are still active advocates. Women with experience in prostitution participated shoulder by shoulder with other women to push the political agenda-of-the-day to include actions that were based on the understanding that prostitution is a serious violation of women’s human rights, is male violence against women, and is an affront to the work to guarantee substantive gender equality in Sweden.

At the time, survivors (with some pertinent exceptions) were not speaking out publicly about their individual experiences in the prostitution industry. There were a couple of reasons for this silence. Despite a general understanding in Swedish society that the majority of women and girls, who are drawn into prostitution by pimps and prostitution users are from marginalized groups and often have experienced other sex-specific forms of male violence, societal attitudes toward these women were often negative. Notably, women with experience in prostitution could risk discrimination in, e.g., employment, education, and intimate relationships, or suffer retaliatory violence at the hands of pimps, traffickers, or prostitution users for speaking out, especially when they attempted to move away from the prostitution industry. It was also evident to the women’s movement that relying heavily on survivor testimony as the clinching method to convince policy makers and the public to change attitudes and reform laws and policies on prostitution and human trafficking would not be a sound or long-term, sustainable political strategy.

It was recognized that prostitution is not just about the individual experiences of women of sexualized harm by men, who have the power to sell, control, purchase, and sexually exploit individual women. The women’s movement recognized that a systemic, political analysis of male violence as a barrier to the full participation of women and girls in society was necessary to create substantive change. Hence, to be effective, this struggle required the use of political methods and strategies that strike directly against the systemic oppression of all women and girls.

Today, some of these discriminatory attitudes still remain in Swedish society. However, due to the feminist efforts to visibilize the culpability of, and hold accountable, the perpetrators, while uncovering the multiple harms done to victims, more women, who have experience in prostitution, are speaking out publicly. Many of these women cite the inspiration drawn from the emergence of the #metoo movement against sexual violence and sexual harassment, which spread through social media across the world in 2017. As one of the founding members of the network #intedinhora [#notyourwhore] stated recently:

My work in #notyourwhore is not about helping young women leave prostitution. My work in #notyourwhore is about working for political measures and structural changes so that no one ever will have to end up in prostitution. I do this together with hundreds of other competent, brave, strong and fantastic people with experience of prostitution and other forms of commercial sexual exploitation. (Aftonbladet 2018b)
A Strong Political Vision
The development toward a new “gender-equal” society – or, in radical feminist terms, a society where the oppression of women and girls by individual men and men as a class is eliminated – involved imagining the kind of society women as individuals and as a class wanted to live in, and to formulate concrete political goals. By necessity, one of the most urgent objectives was and is to create a society where women and girls could live full lives free from male violence, including being free from prostitution.

Clearly Formulated Ideological Principles
A political vision and its implementation are only as strong as their underlying ideology. As was done early on in Sweden, core principles of feminism and human rights were identified and agreed upon, and the ideological base for how to reach the political objectives was identified. Women gathered and developed strategies based on these principles that would bring maximum benefit to women in prostitution and to society at large, with a focus on holding perpetrators accountable.

Political Priority and Will for Action
Core to the consistent implementation and amelioration of the Swedish approach since 1999 has been the engagement of successive governments to make the implementation of the approach an absolute political priority, with key individuals in the government, statutory agencies, in academia and in civil society, and, in particular in the women’s movement expressing a strong will to act to make this approach work and be sustainable long-term.

The Removal of Market Incentives
The Swedish approach also involves the rejection of measures that fuels the demand by allowing the existence and growth of a local prostitution industry, where men, unhindered, demand and purchase sexual acts, and where those that are exploited in prostitution are seen as “willing participants.” There is a consensus that such reactionary measures create serious obstacles to the advancement of a society free of discrimination in which men and women are treated as equals with equal opportunities and responsibilities (Government Communication 2003). These strategies, in combination with a robust public debate, have resulted in that Sweden, today, stands in the forefront of a revolutionary law and policy reform project to prevent and counteract prostitution and trafficking in human beings, firmly rooted in feminist and international human rights principles, which has inspired law makers and civil society representatives in a number of countries around the world.

The approach holds strong public support in Sweden, and has brought about significant positive changes in attitudes, showing, as was one of the original objectives, that the approach has normative as well as direct effects on the reduction of the demand. The positive direct, indirect and normative effects of the Swedish approach have inspired other countries in the European Union and beyond to develop similar approaches such as Israel (2018), the Republic of Ireland (2016), France (2016),
Northern Ireland and Canada (2014), and Norway and Iceland (2009). Consultations on whether to pass legislation that fully prohibits the purchase of a sexual act or sexual service are under way in, e.g., South Africa, England and Wales, Scotland, and Finland.

**A Strong and Gender Equality-Based Coordination Mechanism**

The long-term sustainability, quality, and effectiveness of a comprehensive approach to prevent and counteract prostitution and trafficking in human beings is strongly dependent on it being grounded in substantive gender equality principles to eliminate all forms of discrimination against women and girls. In concrete terms, this means that responsible government agencies incorporate such principles in their implementation of all actions, and that the implementation is closely coordinated and monitored for accountability.

In July 2008, under a new conservative government alliance, the responsibility for the coordination of national measures to prevent and combat prostitution and all forms of human trafficking was moved from the Minister of Gender Equality, to a regional public authority, the Stockholm County Administration Board (Government Communication 2008 at 27). Although all statutory agencies in Sweden are required to mainstream gender equality throughout all actions, the move resulted in a loss of the necessary gender equality expertise, with a direct and negative impact on the quality and impact of the coordination measures. In January 2018, under the Social Democrat/Green Party government, to enhance long-term efficiency, and to counteract fragmentation, the responsibility for the coordination was transferred to a newly specialized public authority for gender equality, the Gender Equality Agency, with the overarching objective to “contribute to the strategic, coherent and long-term governance and effective implementation of the national gender equality policies and strategies” (Government Communication 2016 at 97).

**Ongoing Independent Monitoring**

Finally, consistent, independent monitoring and evaluation of the impact, benefits, and drawbacks is core to the successful and sustainable retention of a gender equality-based approach to prostitution and trafficking in human beings for sexual purpose. To ensure its gradual improvement, and the adaptation of legislation, policies, strategies, and interventions to changing “market” trends, the cooperation between state agencies and feminist and human rights community organizations is necessary.

Regular assessment and annual publication of evidence-based data is also important in the light of the controversy that this approach still can raise. Sweden was the first country in the European Union to appoint an independent National Rapporteur on Trafficking in Human Beings following a joint declaration, The Hague Ministerial Declaration, of the European Union in 1997. The National Rapporteur investigates, monitors, and analyzes the character, state, and scale of prostitution and trafficking in human beings for all forms of exploitation to, within, and from Sweden. The National Rapporteur was given the authority and resources to request information and to collect nonidentifiable, sex-disaggregated data from public...
authorities and representatives of community organizations on different aspects of the Swedish approach. Importantly, the results are published in annual reports that also include recommendations to the government, statutory agencies, and to civil society, often proposing radical changes to the current system (National Rapporteur 2018).

**Conclusion**

The Swedish approach to the prevention and elimination of prostitution and trafficking in human beings for sexual purposes and its effects are very different than the image that the national and international pro-violation advocates promote. The Swedish approach rests on solid political ground. Its radicality is guaranteed by the ongoing engagement of a strong feminist movement. The commitment of individual politicians, political parties, and a responsible government are core to its sustainability. Importantly, an ongoing and healthy public debate in media and local communities is core to its success. Key actors in the justice system have set aside their earlier reservations about the functionality of the legislation, and, through education and hands-on learning, have increased their understanding of the harm of prostitution. Today, law enforcement agencies and the prosecution services focus their interventions on ensuring accountability of the chain of perpetrators – prostitution users, pimps, and traffickers – no matter their social status and background.

The Swedish approach to prevent and eliminate prostitution and trafficking in human beings for sexual purpose may not be flawless, but it is slowly fulfilling the political vision of its initiators – that no woman and girl, man and boy should be subjected to sexual exploitation and human trafficking.

injury, and repair must be a fundamental component of healing. The objective of introducing an organizational culture approach is to enable a program, a system, or even an entire community to organize itself around a shared vision, knowledge foundation, set of values, language, and practice in service of creating a total service delivery environment to counter the complex effects of traumatic exposure. As a result of the scarcity of literature pertaining to evidence-based, trauma-informed treatment for survivors of sex trafficking, and the potentiality of a trauma-informed organizational and systems intervention to reduce stigma and promote healing, this chapter will describe the Sanctuary Model, outline the four major pillars of the model, and discuss its application for enhancing the system of care for survivors of sex trafficking and commercial sexual exploitation.

**Introduction**

An individual’s involvement in the sex industry (e.g., voluntarily or forced) is an incredibly abstruse phenomenon to understand. This is typically due to the complexity found within the relationships among people within the sex industry, as well as the social and systemic inequities, power, and vulnerabilities that people bring with them to each relationship. Regardless of agency or circumstance, involvement in the commercial sex industry can be dangerous both physically and emotionally (Rekart 2006). For example, there are increased physical health risks for people involved (e.g., sexual transmitted infection, physical violence resulting in physical injury, etc.; Decker et al. 2011; Hossain et al. 2010; Muftic and Finn 2013) and risk for serious mental health problems such as psychiatric hospitalizations and substance abuse issues (Greene et al. 1999; Halcon and Lifson 2004). Particularly, victims of sex trafficking and commercial sexual exploitation endure profound moral injury as opposed to their peers who enter the sex industry in other ways. Individuals who have experienced force, fraud, or coercion in entering sex work exhibit poorer health outcomes than those who enter willingly (Decker et al. 2011). Additionally, those who are involved in commercial sex at a younger age are susceptible to poorer health outcomes than those who enter as adults (Decker et al. 2011; Hossain et al. 2010; Muftic and Finn 2013).

Post-traumatic stress disorder (PTSD) is the most common primary mental health diagnosis of young people exiting sex trafficking, followed by depression (Twill et al. 2010). Individuals involved in sex trafficking report contemplating suicide, psychological abuse, and struggling with mental health problems while involved (Hom and Woods 2013). Additionally, many individuals report physical abuse, anxiety, and struggles with disassociation (Hom and Woods 2013). Due to the profound amount of physical and moral injury experienced by sex trafficking victims, repair of the individual is a fundamental component to healing (Bloom...
2018). Specifically, repair must include reestablishing safety and stabilization. It can be very difficult to know how to stabilize an individual who has experienced such profound trauma, thereby relying on the skills and competencies of the clinical professional is not enough. Ensuring that the individual has access to a highly skilled clinical professional, as well as psychoeducation and an organization that is trauma informed are key components to healing (Fisher 1999).

The purpose of this chapter is to discuss the Sanctuary Model®, an evidence-supported, trauma-informed, and trauma-responsive organizational culture approach to addressing the needs of individuals who have been exposed to overwhelming and repeated and sustained exposure to maltreatment, violence, and systematic dehumanization. This chapter begins by providing the reader with a foundational understanding and definition of trauma and how it impacts a person. Next, a review of the current literature on the importance of and evidence behind the use of trauma-informed approaches in treatment for trauma survivors is provided. Specific approaches to treatment for survivors of sex trafficking are outlined, and the Sanctuary Model is introduced as one organizational model for treatment to consider. The four core elements of the Sanctuary Model are described in detail for the reader, followed by a discussion about how organizations and systems often reenact trauma in a parallel process similar to the traumatized populations they serve. This chapter concludes by highlighting implications for the Sanctuary Model in creating a trauma-responsive system of care for survivors of sex trafficking.

Trauma

Through establishing a common definition for trauma, clinical professionals and mental health practitioners benefit from sharing a common language and framework when treating individuals who have experienced sex trafficking. For the purposes of this chapter, Saakvitne et al. (2000) work is relied upon in establishing a definition. Thus, trauma is identified as a unique experience tied to an individual that has endured an event or conditions in which the individual’s ability to integrate his/her/their emotional experience is overwhelmed and the experience (either objectively or subjectively) poses a threat to his/her/their life, bodily integrity, or that of a caregiver or family member (Saakvitne et al. 2000). When experiencing a traumatic event, an individual may become so overwhelmed that they are unable to effectively respond to what is occurring (i.e., run away, fight back, etc.), and traumas typically occur within interpersonal relationships (Blaustein and Kinniburgh 2010). As a result, experiencing a trauma can have long-term effects on people. For example, people who have a trauma history report feeling a loss of control and a general sense of vulnerability within their lives, a changed perception related to their sense of self and expectations of the world around them, as well as their ability to be flexible in their thinking (i.e., open-minded to different ways of being) and feeling secure (Blaustein and Kinniburgh 2010).

Approximately 33% of children living within the USA experience multiple traumas prior to their 18th birthday (Copeland et al. 2007); therefore trauma plays
a complex role in sex trafficking. Childhood maltreatment such as experiencing sexual abuse (Bagley and Young 1987) has been associated with involvement in the sex industry. Also, emotional abuse has been linked directly to youth involvement in sex trafficking (Roe-Sepowitz 2012). One route through which individuals become exploited and trafficked, within a cycle of trauma, is through involvement in the foster care system. Placement in foster care is largely associated with childhood trauma. As such, victims and survivors of sex trafficking are subject to the effects of complex trauma as a result of previous adverse life experiences and vulnerabilities (Courtois 2004). Recent evidence suggests that survivors of sex trafficking experience significantly higher levels of trauma compared to other vulnerable populations, and this trauma often stems from their childhood. For example, one study found that sex trafficked homeless youth were more likely to report child maltreatment and adverse childhood experiences versus non-trafficked homeless youth (Middleton et al. 2018).

Accordingly, clinical professionals and mental health practitioners have been strongly encouraged [through the literature] to rely upon trauma-informed approaches in guiding their treatment of survivors of trauma – particularly individuals who have endured multiple traumas (Ahn et al. 2013; Covington 2008; Hom and Woods 2013; Konstantopoulos et al. 2013; Ko et al. 2008; Miller and Najavits 2012). Due to the often violent and coercive nature of sex trafficking, survivors of sex trafficking likely will present to professionals with multiple, complex traumas, thereby warranting a trauma-informed approach to intervention and treatment. Pointedly, trauma-informed practices have shown to increase coping skills among cisgender women with co-occurring disorders and trauma histories (Gatz et al. 2007).

**A Trauma-Informed Approach**

Trauma-informed service approaches to care are distinctly different than trauma-specific treatment models. Trauma-informed service approaches realize the impact of trauma, recognize the signs and symptoms of trauma in individuals, respond by fully integrating trauma knowledge into policies, practices, and procedures, and work diligently to avoid re-traumatization of the individual through contact with the provider and/or agency (SAMHSA n.d.). Trauma-informed services seek “safety first” and commit themselves to “do no harm.” The SAMHSA-funded Women, Co-Occurring Disorders, and Violence Study (1998–2003) provides evidence that trauma-informed approaches can enhance the effectiveness of mental health and substance abuse services. On the other hand, trauma-specific treatment models have a more focused primary task: they are specifically designed to treat trauma symptoms and facilitate trauma recovery (Fallot and Harris 2009). While an increasing number of promising and evidence-based treated models address PTSD and other consequences of trauma (e.g., trauma-focused cognitive behavioral therapy), only a small portion have been tested with trafficked populations.

The integration of trauma-informed service approaches into systems of care for individuals who have experienced trauma increases the likelihood of meeting
meaningful objectives when addressing problematic behavior. For example, one study identified that the combination of trauma treatment and staff commitment to trauma-informed practices lowered levels of recidivism for criminal behavior and increased physical health outcomes and service utilization among clients (Ko et al. 2008). Further, a unique need has been identified for cisgender women who have been exposed to trauma (as opposed to cisgender men who also have trauma histories) including increased rates of exposure to violence and other types of abuse. Accordingly, specific trauma-informed treatment approaches that are gender-responsive have shown to be effective in supporting women through treatment (Covington 2008).

Frequently individuals involved in sex trafficking accrue criminal charges (e.g., using or selling drugs, theft, recruitment of others into the sex industry) because of their work in the sex industry (US Department of State 2016). Trauma-informed practices have been shown to be effective when working with populations of cisgender women who are have been labeled as victims of a crime and offenders within the judicial system. One study showed that treatment for one of the identified behaviors or experiences was not sufficient (Miller and Najavits 2012). Thus, reliance on a trauma-informed practice approach complimented the trauma-specific treatment in that it addressed the problematic behavior and the root causes (i.e., trauma) allowing for the individual to reach their treatment objectives (Miller and Najavits 2012). It has been well established within the literature that trauma-informed practices are the gold-standard practice for treatment when working with survivors of trauma (Ahn et al. 2013; Elliot et al. 2005; Konstantopoulos et al. 2013; Hom and Woods 2013).

**Trauma-Informed Care: Service Approaches for Sex Trafficking Survivors**

To date, minimal literature exists, which evaluates specific trauma-informed service approaches with survivors of sex trafficking. One study highlights the importance of integrating trauma assessments with the practice of trauma-informed care. This approach allowed the professional to highlight the strength and resilience of the survivor, and normalize behaviors associated with being involved in the sex industry (Hopper 2017). Importantly, trauma-informed practices for survivors of sex trafficking require moving away from a “rescue” approach to supporting victims (Countryman-Roswurm and DiLollo 2016). This is of profound importance because how survivors respond to leaving the sex industry is key to their future health and survival.

Many survivors have a strong mistrust of others, and this makes the work of those attempting to help very difficult. A trauma-informed care approach is the broader term used to include a systemic way of responding to victims of trafficking. A trauma-informed care approach to organizational and systems change is built on the five core values of trauma-informed care: safety, trustworthiness, choice, collaboration, and empowerment (Fallot and Harris 2009). This approach includes all of the
systems involved in the lives of the victims, including judicial, law enforcement, health care, education, and family (Bloom 2011, 2018). If an organization or system can demonstrate that its culture reflects each of the five values in every contact, relationship, and activity, and that this culture is evident in the experiences of staff as well as consumers, then the organization can be considered trauma-informed (Fallot and Harris 2009). In order to achieve this, all members of the responding communities need to be trained in the signs and symptoms of trauma and in the essential elements of serving trafficking victims and survivors.

In line with the tenets of trauma-informed care, safety is a critical element to address for survivors of sex trafficking. Survivors have not been safe and need every aspect of their recovery to attend to their concerns regarding their sense of safety. Trust is a core aspect of treatment and needs to be built slowly with survivors, as they may not have been able to trust the people around them or the situation in which they found themselves. This includes strategies to ensure that survivors are not retraumatized while in recovery. Empowerment, choice, and inclusiveness are also strong components of a trauma-informed approach (Fallot and Harris 2009). Survivors need to be an integral part of their treatment planning with their culture, gender, and personal history always in mind (US Department of State 2016). For all who are a part of the restorative community for trafficking victims and survivors, it is important to understand the trauma-informed approach as a continual learning process, individualized to each and every deserving survivor (Bloom 2018).

Despite the paucity of research available on trauma-informed practices with survivors of sex trafficking, a recent systematic review identified and highlighted the importance of trauma-informed approaches for survivors of sex trafficking. Specifically, the review pointed to the importance of organizational standards of trauma-informed care practices that allowed for efficient multiagency work and well-defined referral pathways for clients (Hemmings et al. 2016). The Sanctuary Model is one trauma-informed care practice that encompasses all the elements needed to effectively treat survivors of sex trafficking. The following outlines, in detail, the core elements of the Sanctuary Model and how it can be applied to systems of care for trafficking survivors.

**The Sanctuary Model®**

Based on the concept of therapeutic communities, the Sanctuary Model® represents a theory-based, trauma-informed, value-driven, evidence-supported (National Child Traumatic Stress Network 2008; Rivard et al. 2005), whole-culture approach that has a clear and structured methodology for creating or changing an organizational culture (Esaki et al. 2013). The objective of such a change is to more effectively provide a cohesive context within which healing from physical, psychological, and social traumatic experience can be addressed. As an organizational culture intervention, the Sanctuary Model is designed to facilitate the development of structures, processes, and behaviors on the part of staff, clients, and the community as a whole that can counteract the biological, affective, cognitive, social, and experiential
wounds suffered by the victims of traumatic experience and extended exposure to adversity (Bloom 2011).

The Sanctuary Model facilitates this organizational culture intervention process through the use of four core elements. These elements are also known as the Pillars of the Sanctuary Model and include (a) trauma theory, an overview of information about how traumatic experiences affect the brain that therefore influence thoughts, feelings, and behaviors; (b) the Seven Commitments, philosophical underpinnings of the Sanctuary Model that describe the ways in which community members agree to behave with each other and the values to which the organization prescribes; (c) S.E.L.F., an acronym for the organizing categories of safety, emotion management, loss, and future, which is used to formulate plans for client services or treatment as well as for interpersonal and organizational problem-solving; and (d) the Sanctuary Tool Kit, a set of ten practical applications of trauma theory, the Seven Commitments, and S.E.L.F., all of which are used by all members of the community at all levels of the hierarchy to reinforce the concepts of the model (Esaki et al. 2013).

Trauma Theory

Trauma theory provides community members with a common understanding regarding how traumatic experiences affect the brain. The Sanctuary Model is unique in that it not only focuses on what happens to human brains exposed to adversity and chronic stress but it also calls attention to what happens to workers, organizations, and human service systems when exposed to adversity and chronic stress. This approach allows community members to better understand what happens to individuals when they are hurt, recognize behaviors as survival skills, and make sense of organizational problems from a trauma perspective (Bloom 2011; Esaki et al. 2013).

The Seven Commitments

The Seven Commitments are a set of common values that community members aspire to – the way community members agree to be in relationships with each other and treat each other in order to mitigate the effects of trauma on individuals and the community as a whole (see Table 1). The commitments serve as universal guidelines for creating strong and healthy, respectful, and high-functioning communities (Bloom 2011; Esaki et al. 2013).

S.E.L.F.

S.E.L.F. represents the common language community members use to understand problems and solve them without blaming themselves or others. S.E.L.F. is a way of organizing conversations in a nonlinear, nonhierarchical, and non-blaming way using language that is not dependent on jargon. Specifically, S.E.L.F. represents
the four categories that define the most significant impairments that people face when exposed to trauma and how we measure healing:

- **Safety**: Traumatized people often struggle with their own safety and the safety of others.
- **Emotions**: Traumatized people often have difficulty managing their feelings and tend to misread the feelings of others.
- **Loss**: Traumatized people often have arrested grief and unresolved losses that contribute to emotions that are challenging to manage.
- **Future**: Traumatized people often have a foreshortened sense of future or a limited belief in their own abilities to create a future for themselves.

When individuals recover from trauma, they have a restored sense of safety, are able to manage their feelings, have integrated their losses in ways that give them their proper due without being overwhelmed by them, and have a sense of empowerment to shape their futures (Bloom 2011; Esaki et al. 2013).

Toolkit

The Sanctuary Model toolkit includes ten daily practices that reinforce the theory, the values, and the language. The tools are a range of practical skills that enable individuals and organizations to more effectively deal with difficult situations, build community, develop a deeper understanding of adversity and trauma, and develop a common practice (see Table 2). The use of the toolkit highlights the importance of giving individuals replacement practices, especially if they will be asked to “give up” certain other practices as part of organizational change and improvement processes. The toolkit offers practices that can be used by both clients and staff alike (Bloom 2011; Esaki et al. 2013).

Typical implementation of the Sanctuary Model consists of an initial 5-day training on the model for key leaders in an organization. The leaders are then tasked with returning to their agency and forming a Core Team, a representative group of

employees from all levels and departments, who are the primary change agents to work with colleagues to implement the model. The Core Team is provided technical assistance from an experienced Sanctuary Model faculty person during a 3 year implementation period. After 3 years, the agency may choose to undergo a certification process in which they are evaluated on how well the model has been implemented. A detailed description of the Sanctuary Model, along with a logic model illustrating linkages between model activities and expected outcomes, is provided in Esaki et al. (2013).

**Understanding Organizational Problems from a Trauma Perspective**

**Trauma Reenactment**

Survivors of cumulative trauma, such as trafficking survivors, often experience trauma symptoms such as hypersensitivity to threats, even minor threats, extremist thinking, aggression and impulse control (e.g., fight or flight), and attention to threat while ignoring less threatening but important information (Cloitre et al. 2008). A trauma-informed approach teaches helping professionals to view these symptoms or behaviors as survival skills. However, another manifestation of trauma is reenactment, and the traumatic reenactment can play out in relational dynamics between people as they replay their trauma with others, rather than just in their own behaviors. Traumatic reenactment is essentially about power. Many children and adults who have experienced trauma and chronic stress reenact specific aspects of their trauma history but also reenact abusive power dynamics in general. Because helping professionals are human, they can fall into these patterns too, both as individuals and as a system (Bloom 2011). Individuals and organizations are vulnerable to reenactment for a number of reasons. Reenactment scenarios may represent familiar patterns that helped the individual survive in other relationships, or they may serve to reinforce the notion that the world is predictable (e.g., predictability may safer, even if it is negative). For example, a trafficking survivor may view their relationship with their pimp or trafficker as “safe” because expectations are clearly spelled out by the person in control and it is predictable, as opposed to the chaotic, unstable home environment they may have left behind. Reenactments often give the trauma survivor a sense of mastery over their original hopelessness and may even allow them to vent frustration, anger, or anxiety. When a reenactment occurs in relationships, it typically takes the form of a triangle that includes three roles (Fig. 1).

**Recognizing Reenactment: Rescripting**

In order to intervene and step out of the reenactment triangle, it is important to first recognize that reenactment is occurring. A helping professional should ask themselves
the following questions when working with or interacting with a trauma survivor or a traumatized organization:

- Am I helping the person (or organization) to change?
- In what ways?
- If not, are we reenacting something?
- How do we change the outcome?

In order to step out of the trauma reenactment triangle, the reenactment story must be rewritten. Changing the story, also known as rescripting, requires innovation. Helping professionals and the organizations and systems they work within often find this challenging because innovation cannot be planned or predicted – it emerges over time, it emerges from the bottom up, and it is often viewed as inefficient. Therefore, leaders must create the time and space for innovation to emerge and for team members to build on their collaborators’ ideas. The Sanctuary Model can help create the common language, values, and tools necessary to recognize reenactment and promote rescripting. It is important to note that reenactment is not always at play and should not be used as a way to excuse bullying or abusive behavior where injustice needs to be confronted. There are instances in which the Persecutor is knowingly and
maliciously persecuting another person. If this is the case, then the Persecutor is no longer “playing the role” as persecutor but operating from a place of conscious awareness, and the injustice should be confronted by the entire community as part of their practice of the commitment of social responsibility (Bloom 2011).

**The Parallel Process**

It order to fully understand the application of the Sanctuary Model to the system of care for trafficking survivors, it is important to understand the parallel process by which organizations reenact trauma, stress, and adversity similar to survivors of trauma. Understanding the parallel process requires looking at things from multiple angles. Look at the figure below (Fig. 2) and note what you see.

Most people will say that they see a horse in this first image. Now look at the figure below (Fig. 3) and note what you see.

Most people will see the frog in this second image, although some will still see the horse. What a person sees depends on which direction they are looking from. Depending on a person’s perspective, this could be one of two very different animals. It would be very bad news for the frog if you were treating it like a horse – imagine trying to put a saddle on it and expecting to ride it. While somewhat humorous, this illustrates an important point. Using Sanctuary,

![Fig. 2 What do you see?](image-url)
practicing trauma-informed care, and understanding the parallel process require looking at things from multiple angles (Bloom 2011). Appreciating the complex ways that trauma exposure manifests itself in organizations means being open to changing your perspective.

When contemplating the impact of trauma exposure on individuals and organizations, it is also important to understand and consider the universality of those traumatic experiences and the vulnerability of our brains to that trauma. Therein begs the question: *If traumatic stress has such an adverse impact on the people we serve, what is it doing to me and the place I work?* Organizations are made up of people, so they are going to act like people do in the face of chronic stress and adversity. The section above discussed what those symptoms look like—and they look very similar in organizations. Much like the clients we serve, organizations are complex, living systems, vulnerable to stress, particularly chronic and repetitive stress, as well as trauma (Bloom 2011).

What causes organizational stress? Anything that compromises safety and security for the system can contribute to organizational stress. Organizations, and the systems they work within, all experience stress. These types of organizational stress are often interrelated and overlapping. Because of the organic nature of organizations, their experiences and responses to trauma and stress are much like the responses of the individuals and families they work with. These experiences and responses across systems interact with one another, and this complex interaction is known as the parallel process.

In this way, much like the individuals and families they work with, organizational stress and trauma can act as a barrier to organizational change. Additionally, if
organizations are not inoculated against the impact of trauma, the organization will begin to reflect the trauma-reactive functioning of the client it serves in its own functioning. Specifically, a trauma-organized system, similar to a trauma-organized person, may experience a lack of basic safety and trust, loss of emotional management, problems with cognition communication problems, problems with authority, a confused sense of justice, and an inability to grieve and anticipate the future (Bloom 2011).

Many of the organizations that serve trafficking survivors experience significant and chronic stress, and many exist within a context of constant or chronic crisis, which results in chronic organizational hyperarousal. Once an organization is hyperaroused, its members experience a lack of safety (e.g., physical safety, psychological safety, social safety, moral safety) and a loss of basic trust. When people do not feel safe, they begin to act defensively. A triggered or hyperaroused organization often exhibits defensive behaviors that perpetuate feelings of mistrust, which may be observed as silence, glaring, abruptness, insults, blaming, discrediting, aggression, controlling, threatening, yelling, secrets, mixed messages, aloofness, and even unethical conduct (Bloom 2011). Once people feel unsafe and trust is lost, communication breaks down. As communication structures become more compromised, important topics become “undiscussable,” spoken about only in the “meetings after the meetings.” As a result, the issues that are associated with the greatest emotional charge are separated from normal organizational functions, in a process referred to as organizational alexithymia (Bloom 2011). As a result, conflicts increase and are not resolved, which leads to impoverished relationships. When relationships are damaged, people and teams often begin to work in silos, and organizational dissociation sets in. Then, the organization stops learning from itself and organizational memory is lost, which is also known as organizational amnesia (Bloom 2011).

As discussed previously, organizational stress potentially increases conflict. Conflict is very important to pay attention to, as it is the “alarm bell” of the social immune system. Ignored and unresolved conflict can eventually lead to aggression in various forms. When organizational stress and conflict are high, feedback loops break down, and failure is repeated. This type of systematic error is also known as reenactment, within the context of trauma theory with primary trauma survivors. This repetition of poor decisions and poor problem-solving approaches leads to a loss of democracy and loss of participation. The staff and the organization begin to feel helplessness about problems, and learned helplessness sets in. As staff began to feel helpless and useless, this results in a loss of critical thinking skills, which ultimately impacts decision-making at every level of the organization (Bloom 2011).

Because trauma symptoms do not just happen in individuals, but also in groups of people, an organization may exhibit parallel symptoms such as a state of high alert, inability to think clearly, extreme thoughts, attention to threat, intense and prolonged anxiety, and a drive to take action. In this way, the whole system can manifest the symptoms of trauma through commonly held values, beliefs, assumptions, practices, policies, and laws. When this occurs, clients may be exposed to the same toxicity that brought them to us for help (Bloom 2011). The figure below depicts the parallel process within which trauma symptoms can play out in organizations (Fig. 4).
Creating a Trauma-Responsive System of Care

So what can organizations do, particularly those who serve trafficking survivors? They can change their approach. Organizations that serve trafficking survivors can start with changing the way that they approach, assess, and diagnose their clients. They can promote a trauma-sensitive culture and recognize symptoms as survival skills, not only in their clients but also within themselves and their organizations. In doing this, they can strive to give their clients a different experience.

In summary, the objective of introducing an organizational culture approach such as the Sanctuary Model is to enable a program, a system, or even an entire community to organize itself around a shared vision, knowledge foundation, set of values, language, and practice in service of creating a total service delivery environment to counter the complex effects of traumatic exposure (Bloom 2018). Survivors of sex trafficking and commercial sexual exploitation who have experienced complex, cumulative trauma continue to suffer from suboptimal physical and mental health. Yet, research demonstrates that survivors of trauma can be resilient if they are connected to positive, caring service providers (Harney 2007; Larkin et al. 2012). Unfortunately, high turnover and emotional exhaustion among staff who work with traumatized individuals threatens to create an environment in which it is difficult for survivors to build meaningful connections with providers. The Sanctuary Model aims to reverse these trends through a common language, common values, and a set of tools that create an emotionally and physically safe environment for traumatized clients and everyone connected with them. Although more rigorous evaluation of the Sanctuary Model is needed, the emerging research demonstrates that it is a promising approach for creating a healthy environment that promotes...

![Fig. 4 The parallel process (Bloom 2011)]
emotional health and well-being for agency personnel and the clients they serve (Rivard et al. 2005; Stein et al. 2011). By protecting the emotional health of agency personnel, the Sanctuary Model creates a context in which service providers can be emotionally available to each other and their clients, resulting in positive relationships that create the conditions for resilience.

Abstract

Responses to human trafficking are situated within a transnational criminal law framework that aims to address criminal actions through prosecution, while promoting the inclusion of human rights to prevent trafficking and protect and assist victims of trafficking. Responses to trafficking have been critiqued for overemphasizing criminal prosecution at the expense of human rights. This chapter explores the limits of enforcement-based and prosecution-oriented approaches from a human rights lens. Beyond a simple dichotomy between human rights versus prosecution, the chapter considers how anti-trafficking

**Introduction**

Conceptions of human trafficking and international response mechanisms have gained significant traction in the past quarter century, particularly since the adoption of the United Nations’ *Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children* (2000). Such anti-trafficking responses have been widely critiqued for their weak human rights framing and especially for failing to adequately safeguard the rights of individuals and communities in situations of vulnerability. This chapter provides an overview of the human rights provisions that have been incorporated into anti-trafficking agreements and discusses the limits of existing international anti-trafficking responses. Despite sustained critique and clear efforts to integrate human rights, our analysis reveals that anti-trafficking notions of prevention and protection serve to reinforce enforcement-based anti-trafficking frameworks globally.

Anti-trafficking legal efforts and responses have been unable to take up the transformative changes necessary to move beyond crime suppression and prevention agendas that create, rather than mitigate, the rights violations experienced by persons victimized by human trafficking. In global contexts of structural inequalities, such as post- and settler-colonial realities, neoliberal models of crime control contribute to the reproduction of ongoing gendered and racialized oppressions (Hua 2011; Kaye 2017; Suchland 2015). Accordingly, broader transformative changes, such as decolonial uncoupling of rights and enforcement, are required for anti-trafficking efforts to have any effect on the systemic violence at the heart of systems and societies characterized by ongoing oppressions.

Beyond such wider critiques, it is evident that even within international response models that have integrated protection and prevention alongside prosecutorial emphasis, there are severe restrictions that hamper the actualization of rights provisions and corresponding efforts to provide assistance to victimized persons. In response to critiques of the harms of enforcement-driven anti-trafficking responses, international proclamations assert that anti-trafficking efforts should not adversely affect the rights and dignity of trafficked persons and others affected by anti-trafficking responses. In spite of extensive work to incorporate provisions of prevention and protection and to ground anti-trafficking in a human rights framework, such provisions are predominantly voluntary and weak and are lacking in necessary oversight. As a result, the border maintenance and crime control roots of anti-trafficking responses continue to result in rights violations of persons in situations
of vulnerability, especially internally displaced persons, migrants, refugees, and asylum seekers, and those who work in precarious labor sectors.

**International Agreements and Ineffective Protections: Human Trafficking as a Transnational Crime**

The UN General Assembly adopted the *Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children* (hereinafter the *Trafficking Protocol or Protocol*) on 15 November 2000, with the agreement entering into force on 25 December 2003. The *Trafficking Protocol* is one of three optional protocols (treaties) supplementing the *United Nations Convention against Transnational Organized Crime* (hereinafter the *Convention*). At the time of adoption, the *Convention* was seen as a new crime suppression agreement intended to establish an international legal framework to enhance interstate cooperation to combat serious transnational crimes committed by organized criminal groups.

The *Trafficking Protocol* draws on a lengthy history of international agreements designed to suppress transnational trafficking in persons (see, e.g., Morcom and Schloenhardt 2011; Simm 2004). Reinforcing the priorities of the nation-state, the *Protocol* builds on a legacy of racialized and gendered approaches to preventing (white) women’s involvement in prostitution and slavery, such as the 1949 *Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others* which built on previous anti-slavery and anti-trafficking instruments (e.g., Bernstein 2010; Doezema 2010; Gallagher 2010; Kaye 2017; Kempadoo 2005). The *Protocol* also emerged alongside international treaties to prohibit forced and exploitive labor (e.g., International Labor Organization (ILO) *Conventions* 29, 105, 138, and 182) and to promote human rights with particular reference to ending discrimination against women (e.g., Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW) 1979, article 6) and children (e.g., Convention on the Rights of the Child (CRC), article 35). Linked to globalization and neoliberalism in the 1980s and 1990s, the UN General Assembly established an intergovernmental Ad-Hoc Committee of the UN Crime Commission, a law enforcement body, to formulate a comprehensive convention to combat transnational organized crime and to enact international agreements on various forms of trafficking. The Ad-Hoc Committee was formed in the context of heightened international concern about the growth and adverse consequences of transnational organized crime and growing unease about the irregular movements of migrants from developing countries and economies in transition (Chuang 2010; Gallagher 2001; UN General Assembly 1998).

Along with its parent *Convention*, the *Trafficking Protocol* was formally negotiated over a roughly 2-year period by the representatives of more than 80 governments, alongside numerous NGO and intergovernmental representatives. During these negotiations, two divergent blocs of (female dominated) NGO lobbying alliances sought to influence the (predominantly male) government and intergovernmental representatives negotiating the *Protocol* (Ditmore and Wijers 2003). The first
bloc, a Human Rights Caucus, representing a human and labor rights perspective and opposing any form of criminalization of adult consensual participation in sex industries, was seeking to ensure the Protocol addressed the conditions of forced labor or abusive working conditions in all work sectors, including the commercial sex sector. The opposing neo-abolitionist US-led bloc, the Coalition Against Trafficking in Women (CATW) and its partners, represented a perspective that all prostitution is slavery and a violation of women’s human rights and sought to have the Protocol abolish trafficking and the sex industries by criminalizing clients and third parties who manage, facilitate, or profit from commercial sex (Bernstein 2010; Chuang 2010; Desyllas 2007; Ditmore and Wijers 2003; Doezema 2004; Kotiswaran 2014; Outshoorn 2005; Simm 2004). The CATW bloc were strongly aligned with a neoliberal (individualized responsibility) crime control model whereby they view the most effective way to prevent and combat trafficking is through the criminalization of trafficking perpetrators (including the clients of sex workers) and by treating all sex workers as “victims” (see, e.g., Leidholdt 2003). This resonated with the perspectives of many of the governments negotiating the Protocol, especially the USA. The USA has subsequently controlled, to a large extent, the neo-abolitionist global anti-trafficking agenda through its foreign policy that conditions foreign aid on achieving a particular rank in its controversial unilateral annual anti-trafficking ranking system (see, e.g., Chuang 2006).

The Trafficking Protocol and its compromise definition of trafficking in persons are very much a reflection of these polarized divisions between the coalition mobilized around sex worker and migrant rights and the neo-abolitionist coalition. The ultimate prioritization of crime control by the governments negotiating the protocol resulted in a missed opportunity to instill strong human rights protections within the Trafficking Protocol. The Human Rights Caucus sought various protections for trafficking victims that would be available irrespective of their cooperation with legal authorities, such as the right to safe shelter and various forms of government-provided social, medical, and legal assistance, the ability to recover lost wages and sue for damages, the provision of residency and work permits during judicial proceedings, and a broad nondiscrimination clause (Chuang 2010; Ditmore and Wijers 2003; Gallagher 2001). While some of these protections are included in a restricted capacity in the Protocol, they are included as non-legally binding – i.e. discretionary – obligations on States parties. In particular, intergovernmental and NGO human rights proponents were not successful in lobbying for the inclusion of (1) a non-prosecution (and non-punishment) clause for individuals victimized by trafficking for status or related criminal offenses, such as undocumented migration, working without proper state documentation, or engaging in sex work; (2) a legally binding obligation on the safe and voluntary return of trafficked persons rather than immediate repatriation; (3) a legally binding obligation to allow trafficked persons a reflection period and to remain temporarily or permanently in a receiving country; (4) a requirement that States parties use a proceeds of crime fund to compensate trafficking victims; or (5) legislative guidance identifying who should be labeled as a trafficking victim and therefore entitled to specific protections otherwise unavailable in the context of criminalized migration (Gallagher 2001; Office of the United
Alongside the exclusion of compulsory protections, human rights advocates were also unsuccessful in their interventions to reframe several of the draft Protocol’s preventive provisions. In particular, preventative provisions such as those focused on strengthening border controls can be used by States parties to limit freedom of movement, especially in discriminatory ways against women and girls, and can negatively impact internationally recognized rights of asylum (OHCHR/UNICEF/IOM 2000). Rather than uphold the rights of migrants, such notions of “prevention” serve to reinforce state-based interventions and enforcement-based responses that result in ongoing human rights violations by further restricting and criminalizing migratory movements.

There are varying reasons why the human rights proponents were unsuccessful in pressing for the inclusion of stronger human rights protections. For one, their concerns were largely sidelined by the polarizing (year-long) policy debate over the legal definition of trafficking in persons; and two, some of the concessions being sought were considered to potentially undermine state sovereignty interests in controlling both commercial sex and migration flows (Ditmore and Wijers 2003; Gallagher 2001). However, the de-prioritization of human rights protections was short-sighted. Given the centrality of victim cooperation to identifying and prosecuting human traffickers, the failure to achieve these minimal human rights protections arguably has undermined the effectiveness of the Protocol as a law enforcement instrument. There are few, if any, incentives for victimized persons to come forward and cooperate with authorities. Indeed, there is little to prevent trafficked persons and witnesses from being deported before criminal proceedings have commenced or been completed. A lack of legislative guidance on how trafficked persons should be identified and the inability of States parties to promptly and accurately identify human trafficking in practice also means that the Protocol is unlikely to afford trafficked persons the minimal human rights and assistance protections it proclaims to provide. The resulting Protocol is widely recognized as a crime control and border securitization instrument – not a human rights instrument (Gallagher 2001; Jordan 2002). It also emphasizes individual criminal responsibility as opposed to broader structural conditions that contribute to human trafficking and criminalized migratory movements. Its primary aim is to facilitate law enforcement cooperation between States parties in the interests of preventing and prosecuting those who traffic in persons, especially women and children, while simultaneously protecting state sovereignty (Protocol Art 2; Convention Art 4). While its scope of application is the investigation and prosecution of transnational trafficking committed by an organized criminal group, domestic anti-trafficking laws are expected to penalize cross-border and domestic trafficking offenses committed by both organized criminal groups and individual traffickers (Jordan 2002). As a crime control instrument, the Protocol requires that States parties criminalize trafficking when committed intentionally, as well as related offenses (including incomplete offenses and other modes of participation such as an accomplice, organizing or directing
(Art 5)). Notably, Article 5 on criminalization is the only unambiguously legally binding article of the Protocol. (The specific language is “states shall adopt such legislative and other measures... to establish as criminal offences.”) Jordan (2002) asserts that, in the absence of a non-prosecution clause, this provision can also be used to prosecute trafficking victims for status offenses (such as working or traveling without documentation required by States parties) or for participating or assisting in their own trafficking.

While a secondary aim of the Protocol is to protect and assist trafficked persons “with full respect for their human rights” and the Protocol includes some important victim assistance and protection provisions (Articles 6–8), these provisions are soft obligations, framed in vague or permissive language. (e.g., the articles employ such phrasing as “in appropriate cases,” “to the extent possible under domestic law,” “shall consider implementing” and “shall endeavor,” “contains measures,” or “shall preferably be voluntary.”) Nevertheless, some of the parent Convention provisions are more robust and may provide better avenues for trafficked persons to access certain protections, namely, Convention Articles 25.1 and 25.2 on victim and witness protection and access to compensation and restitution (Gallagher 2001; Jordan 2002).

The Protocol references human rights in its preamble, and its Article 2(b) stated the purpose. Attention to human rights protections is also mentioned in relation to developing or strengthening training programs for law enforcement and immigration officials, and in the savings clause, which ensures that the Protocol does not alter the existing international legal obligations of States parties, including international human rights and humanitarian law and refugee law extending to the principle of non-refoulement (Articles 10.2 and 14.1). (UNHCR (1977) proclaims non-refoulement as the most essential component of refugee and asylum status by protecting against return to a country where there is a reasonable fear of persecution.) Article 14.2 also sets out a cursory nondiscrimination clause for trafficked persons, which seeks to protect trafficked individuals on some internationally recognized prohibited grounds (race, religion, nationality, sex). However, key forms of discrimination, such as occupational status (sex worker) or in relation to sexual orientation and gender diversity, are not explicitly protected (Jordan 2002). Such provisions also do not account for state-based interventions that reproduce systemic inequalities and the conditions whereby trafficking and other rights violations emerge.

In brief, the Protocol is justifiably criticized for the weak framing of its assistance and protection assurances to trafficked persons, which essentially render these provisions as discretionary recommendations rather than binding obligations for States parties. They fall short of existing international legal obligations, particularly in relation to the provision of legal information to crime victims and a victim’s right to an effective remedy (Global Alliance Against Traffic in Women (GAATW) 2007; OHCHR/UNICEF/IOM 2000). There are equally serious concerns about the prevention provisions of the Protocol, which, in addition to their permissive wording, arguably place too much emphasis on border securitization with consequent ramifications in limiting freedom of movement, especially for women and girls. Further critiques include too little emphasis on the responsibility of States parties to address...
the complex structural economic (poverty, unemployment, debt), social and cultural (gender violence and discrimination), political and legal (inadequate laws, lack of justice system capacity, government corruption), and international (feminization of migration and restrictive immigration policies) forces that lead to trafficking in persons (OHCHR/UNICEF/IOM 2000).

Finally, consistent with other crime suppression treaties but contrasting with the more vigorous independent monitoring and complaint mechanisms for human rights treaties, the Protocol lacks accountability measures and monitoring mechanisms. Article 32 of the Convention provides for the establishment of a “Conference of the Parties to the Convention” whose main role is to improve state capacity to combat transnational crime, followed by promoting and reviewing implementation of the Convention and making recommendations for its improvement (Gallagher 2001). In establishing priorities for the Conference of Parties and its various working groups, clear prioritization has been given to definitional issues (years 1–2) and criminalization (years 3–4), while victim assistance and protection have been relegated to years 7–10 (Conference of the Parties to the United Nations Convention against Transnational Organized Crime 2016).

Still, the general and specific recommendations of the Working Group on Trafficking in Persons have addressed various victim assistance and protection matters in relation to and beyond the minimal assistance and protection provisions of the Protocol (Gallagher 2015), including the non-prosecution and non-punishment of trafficking victims, adopting a human rights approach, rights to legal aid, legal information and consular assistance, and discouraging the use of detention centers (Working Group on Trafficking in Persons 2009; 2010; 2011; 2017; 2018). In addition, the United Nations Office on Drugs and Crime (UNODC) provides technical support to States parties implementing the Convention and its Protocols. In this capacity, it has developed a range of tools, training materials, technical papers and reports, as well as a knowledge portal. While continuing to give primacy to criminalization and border control, as of 2012, the UNODC has committed to strengthen victim assistance and protection measures including intensifying human rights protections (UNODC website).

**Additional Human Rights Protections Outside of the Protocol**

In view of critiques regarding its comparatively minimal victim assistance and human rights protections, the UN General Assembly, the UN Human Rights Council, the UN Office of the High Commissioner for Human Rights (OHCHR), and other UN agencies such as UNICEF and the United Nations High Commissioner for Refugees (UNHCR) have adopted various resolutions and decisions and introduced supplementary guidelines and coordinating mechanisms that aim to further promote and protect the human rights of trafficked persons. (These stand in addition to a wide array of regional instruments and mechanisms that are beyond the scope of the present analysis. We also omit other important special procedures of the Human Rights Council (such as the Special Rapporteurs on Violence against
Women, the Human Rights of Migrants, the Sale of Children, and Contemporary Forms of Slavery) and treaty monitoring bodies (such as the CEDAW, CRC, Human Rights Committee, Committee on Migrant Workers, Subcommittee on the Prevention of Torture, and Committee on the Right of Persons with Disabilities) that directly and indirectly monitor human rights and trafficking. Nor do we consider the ILO conventions relevant to trafficking, including important instruments adopted in 2011 and 2014 concerning decent work for domestic workers and forced labor.)

In particular, the OHCHR introduced the *Recommended Principles and Guidelines on Human Rights and Human Trafficking* (OHCHR Recommended Principles) in 2002. These principles and guidelines recognize trafficking in persons as a particularly abusive form of migration and provide “practical, rights-based policy guidance” on the prevention of trafficking and the protection of trafficking victims for government, intergovernmental, and nongovernment organizations (OHCHR Recommended Principles: 2). A set of four recommended principles clearly prioritize the primacy of human rights and the human dignity of trafficked persons, migrants, internally displaced persons, refugees, and asylum seekers vis-à-vis preventing trafficking, protection and assistance, and criminalization, punishment, and redress. The prevention principles stress the importance of addressing the root causes of trafficking including the demand for cheap labor and services and factors such as poverty, inequality, and discrimination. The protection and assistance principles emphasize the importance of the non-prosecution and non-punishment of trafficking victims and unconditional access to physical protection and psychosocial care services. They also recognize the importance of legal assistance, the proper recognition of child trafficking victims and child rights, the provision of protection and temporary residence to victims who participate in legal proceedings, as well as safe and, to the extent possible, voluntary return. The recommended criminalization, punishment, and redress principles emphasize that, to the extent possible, confiscated assets (proceeds of crime) shall be used to compensate trafficking victims and that States ensure trafficked persons are afforded access to effective legal remedies. Likewise, the 11 recommended guidelines position the promotion and protection of human rights as the foremost guideline. In contrast to the *Protocol*, which applies to the actions of States parties or governments that have ratified or acceded to the *Protocol*, the recommended principles and guidelines are intended to guide the actions of governments, as well as intergovernmental and nongovernment organizations. (This wider application is particularly important since not only governments but also nongovernment organizations have been implicated in violating the rights of trafficked persons in the context of “well-meaning” anti-trafficking interventions (see, e.g., GAATW 2007; Hua 2011; Kaye 2017).)

The OHCHR further reaffirmed that anti-trafficking measures should not adversely affect the human rights and human dignity of trafficked persons, migrants, internally displaced persons, refugees, and asylum seekers in their extensive commentary on the recommended principles and guidelines in 2010 (OHCHR 2010). A number of other UN agencies, intergovernmental and international organizations, have proposed rights-based guidelines (e.g., UNICEF 2006; UNHCR 2006; World

In terms of additional political commitments on the human rights of trafficked persons, the UN General Assembly has convened thematic debates and dialogues on trafficking in persons (e.g., in 2008 and in 2009) and adopted resolutions that have addressed, inter alia, the protection of trafficked persons. (We examined UN General Assembly Resolutions on trafficking in persons from 1947 onward, focusing mainly on resolutions between 1993 and 2018. In addition to the three noted themes, a 1972 resolution explicitly addressed exploitation of labor through illicit and clandestine trafficking and then appears to have shifted to the traffic in women and girls in 1994.) At the same time, the UN General Assembly has consistently emphasized the need to “enforce and strengthen effective measures to combat and eliminate all forms of trafficking in persons in order to counter the demand for trafficked victims and to protect the victims” (World Summit Outcome Document, para 112). Its high-level dialogues on migration in 2006 and 2013 have recognized the feminization of migration and the need to combat gender-based violence, in addition to reiterating its commitments to prevent and combat trafficking in persons and to protect trafficking victims while encouraging Member States to ratify and implement relevant international instruments (Summary 2006; Declaration of the High-level Dialogue on International Migration and Development 2014). The New York Declaration for Refugees and Migrants similarly recognizes the special needs of all persons in situations of vulnerability, including women at risk, children, and trafficked persons, and the need to take steps to address those vulnerabilities. The declaration commits to vigorously combat human trafficking with a view to its elimination and to disrupt and eliminate the criminal networks that are involved.

In relation to implementing its various political commitments, the UN General Assembly mandated the establishment of an Inter-Agency Coordination Group against Trafficking in Persons (ICAT) to improve policy coordination and share information and good practices on anti-trafficking initiatives in 2007. The ICAT consists of 12 UN and international organizations (the OSCE, UNAIDS, Interpol, UN Peacekeeping, UNICRI, UN Women, UNICEF, UNODC, UNHCR, OHCHR, IOM, and ILO) and is intended to facilitate a comprehensive approach to preventing and combating trafficking in persons, including protection and support for victims, and an approach that is human rights-based and gender- and age-sensitive. Toward this end, the ICAT has published a number of reports, some jointly with the UNODC, on various dimensions of trafficking (Inter-Agency Coordination Group against Trafficking in Persons website). In the same year, six UN and international agencies (ILO, OHCHR, UNICEF, UNODC, IOM, and OSCE) launched the United Nations Global Initiative to Fight Human Trafficking (UN.GIFT) to promote the “global fight against trafficking” by increasing awareness, promoting rights-based responses, building capacity, and encouraging partnerships (United Nations Global Initiative to Fight Human Trafficking website).

Importantly, in 2010 the UN General Assembly adopted a Global Plan of Action to Combat Trafficking in Persons aimed at translating these various political commitments into concrete actions. In addition to stressing the centrality of human rights
in all efforts to prevent and combat trafficking in persons and to protect, assist, and provide redress to victims, the action plan expands on human rights protections for trafficking victims and sequentially prioritizes such protections ahead of prosecution and international legal cooperation. Among other actions, it reafirms that human rights and measures to combat trafficking in persons are complementary and mutually reinforcing and urges governments to ensure that trafficked persons are not penalized; that their privacy, identity, and safety are protected; that psychosocial services are provided; that there are options for temporary or permanent residency; that return is safe and preferably voluntary; that there is access to compensation, redress, and legal information; and that victims are provided with a reflection period. The action plan also established a UN Voluntary Trust Fund for Victims of Trafficking in Persons, although in practice it has been underfunded and does not provide direct financial assistance to trafficking victims (UN General Assembly Resolution 2010).

In terms of monitoring how the human rights of trafficking victims are protected in practice, the (then) UN Commission on Human Rights appointed a Special Rapporteur on trafficking in persons in 2004. The Special Rapporteur was originally mandated to focus on the human rights aspects of trafficking victims, especially women and girls, with an expectation its work would reference the Recommended Principles and Guidelines on Human Rights and Human Trafficking. In 2011, this focus was expanded to additionally examine the human rights impacts of anti-trafficking measures with a view to recommending adequate responses and avoiding the revictimization of trafficking victims (Human Rights Council 2011, Resolution 17/1). Thematic reports of the Special Rapporteur have focused attention on various concerns ranging from the rights of victims to assistance, protection, and support to human rights in the context of criminal justice responses to trafficking in post-conflict situations and in the context of mixed migration movements (Special Rapporteur on Trafficking, especially Women and Children website). One of the most significant contributions of the Special Rapporteur has been the articulation of Basic Principles on the Right to an Effective Remedy for Victims of Trafficking in Persons, although these principles have yet to be endorsed by either the UN General Assembly or the Human Rights Council (Ezeilo 2014). In relation to this and its other special procedures, the UN Human Rights Council has adopted several of the Special Rapporteur’s resolutions.

Quite controversially, the progress of individual governments in implementing anti-trafficking measures is unilaterally monitored by the US Department of State, Office to Monitor and Combat Trafficking in Persons. A main focus of these monitoring efforts is the criminalization and prosecution of traffickers; the human rights impacts of anti-trafficking efforts do not feature prominently in the annual reports and country narratives (2001–2017). In fact, Gallagher (2015) has observed these reports only acknowledged the negative impacts of anti-trafficking interventions in 2009 and that such coverage continues to be uneven given that the “harms” of anti-trafficking interventions are not part of the formal US evaluation criteria.
Critical Analysis of Frameworks of Protection in an Enforcement-Based Context

The few assessments of the Protocol’s implementation and impacts in the now 18 years since its adoption and 15 years of coming into force are mixed. As Gallagher and Surtees (2012) observe, there has been limited evaluation of the effectiveness or impacts of anti-trafficking interventions despite significant economic investments by governments, intergovernmental organizations, and NGOs in countering trafficking. Positive reflections note the importance of the Protocol as a landmark or agenda-setting agreement for cooperative international law enforcement to combat trafficking in persons, the significance of the Protocol’s internationally agreed definition of trafficking in persons, and that the Protocol affords some emphasis in protecting the human rights of trafficked persons (Bhabha 2015; Ezeilo 2015; Gallagher 2015). Definitionally, the Protocol also marked a significant departure from the 1949 Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others that equated all prostitution and various prostitution-related activities as trafficking irrespective of the consent of the person. Although emphasizing trafficking in women and children, the Protocol definition is lauded for being gender-inclusive and comprehensive in relation to the various types of trafficking that are contemplated (at minimum including the exploitation of the prostitution of others or other forms of sexual exploitation, forced labor or services, slavery or practices similar to slavery, servitude, or the removal of organs), as well as including coercion as a core definitional element.

Yet, the Protocol is a crime suppression treaty; it is intended to facilitate law enforcement cooperation between States and is not a human rights agreement. As Boister (2002) has observed, crime suppression treaties are not known for their protection of the human rights of criminal defendants, let alone crime victims, and have the potential to significantly threaten individual human rights such as privacy, liberty, fair trial rights, and in relation to the state confiscation of private property (proceeds of crime). Boister (2002) further argues it is faulty to assume that human rights will be protected via existing human rights instruments and mechanisms. The UNODC-sponsored treaty remains focused on government interests to combat the growth in transnational organized crime (and irregular migration) at the expense of human rights protections and victim assistance (Chuang 2010; Jordan 2002). There are no requirements for States parties to adopt rigorous human rights protections for trafficking victims and arguably many disincentives to do so, not only in terms of the associated fiscal costs of such interventions (such as state funding for temporary residence and compensation schemes) but also in relation to limiting state sovereignty and security interests, especially in relation to a State’s ability to control irregular migration and commercial sex.

The Trafficking Protocol is the most widely ratified of the Convention’s three supplementary agreements with 117 signatories and 173 state parties (as of 18 September 2018). There is also a high degree of government compliance with the criminalization obligations of the agreement, with 95 percent of those countries
ratifying or acceding to the Protocol having introduced or strengthened domestic laws specifically criminalizing some or all forms of trafficking in persons as defined by the Protocol (UNODC 2016). At the same time, most assessments of the Protocol’s impact at the national level consistently point to the fact that comparatively few trafficked persons have been identified and the number of prosecutions remains low with few convictions of traffickers (Farrel et al. 2014). While the available research suggests that a low number of prosecutions and convictions may result from a number of factors – the relative newness of anti-trafficking offenses at the national level, the hidden nature of the crime, public corruption in criminal justice systems, low rates of incidents (Farrel et al. 2014; Gallagher 2016; Kangaspunta 2015), complex evidential issues in trafficking cases (UNODC 2017) (Research examining some of the complexities involved in prosecuting trafficking offenses demonstrates several evidentiary challenges, including the need for corroborative physical evidence and significant victim cooperation; yet victim credibility challenges are common in these types of cases. In addition to the definitional issues we note, these evidential concerns make it difficult to make any firm assertions about the rates of instances of human trafficking in any country, the degree of “success” of any state efforts in prosecuting such cases, and whether the Trafficking Protocol itself is being effectively implemented and employed to combat human trafficking. On evidential issues, see UNODC 2017; Millar and O’Doherty 2015.); or the search for ideal or iconic victims (Srikantiah 2007) – it is difficult to escape the Protocol deficiencies in providing more comprehensive and legally binding commitments to protect the human rights of trafficked individuals. As it stands, unless national laws and policies exceed the minimum protections of the Protocol, there are few, if any, incentives for trafficked persons to come forward and cooperate with legal authorities or to prevent victims and witnesses from being deported before criminal proceedings commence or can be completed since such proceedings may be many years in duration (Jordan 2002). Moreover, controversies with trafficking prosecutions remain serious. In cases that have been prosecuted, scholars have noted the significant political pressure to prosecute resulting in violations of the rights of criminal suspects, including wrongful prosecutions, unfair trials, and inappropriate sentencing (Gallagher 2016). Other critiques include violations of the rights of trafficked persons, such as making residency and citizenship assistance conditional on cooperation, the disproportionate targeting of the sex sector and criminalization of sex workers within anti-trafficking approaches, and the near-exclusive focus of governments on prosecutions versus protections and assistance (see, e.g., GAATW 2007 and the Anti-Trafficking Review, 2015, special issue assessing 15 years of the UN Trafficking Protocol). Indeed, most monitoring efforts have focused on ratification, criminalization, prosecutions, and convictions, which are easy to measure. It is far less clear how States parties are implementing human rights and victim assistance and protection measures at the national level (see, e.g., UNODC Global Reports 2009, 2012, 2014, 2016), and there seems to be a dichotomous expectation that nongovernment organizations rather than States parties will monitor any adverse human rights impacts of anti-trafficking campaigns and interventions.
The lack of an effective monitoring mechanism has contributed to uneven implementation of the Protocol’s political commitments at the domestic level since States parties have considerable latitude to interpret and choose which obligations to implement (Allain 2014; Gallagher 2015). In this regard, it was widely surmised that States would choose to implement those obligations that are least expensive (criminalization and some of the prevention obligations like training and awareness raising) over those that are more expensive (complex assistance to victimized individuals and protection and human rights). In particular, and contrary to its intended purpose, the Protocol has not produced definitional uniformity among States parties. In view of its complexity and the widely held perception that the three definitional elements would provide too exacting a standard for prosecutors to prove in domestic courts, States parties have been encouraged to incorporate the “essence of the definition” in national legislation. More specifically, according to Jordan (2002), States have been encouraged to adopt a definition of trafficking in persons as the “recruitment, transportation, transfer, harboring or receipt of persons, by any means, for forced labor or services, slavery or practices similar to slavery, servitude or the removal of organs,” which obviates the coercive means as a core defining element of trafficking. Allain (2014) demonstrates that national legal definitions of trafficking in persons vary, which serves to undermine the main intent of the Protocol to facilitate interstate cooperation in combating trafficking in persons via harmonized legal definitions. A lack of agreement between States parties about what constitutes trafficking in persons also makes it exceptionally difficult to measure the extent of trafficking globally or regionally (including but not limited to the number of identified victims, investigations, prosecutions, and convictions) and whether the Protocol and its implementation at the national, regional, and international levels are actually having any effect in reducing trafficking.

Nor has the Protocol definition resolved long-standing divisions on issues of consent or agency. The inclusion of “exploitation of the prostitution of others,” which could refer to pimping and/or procuring, remains contentious and seemingly intractable prostitution policy debates about forced versus voluntary participation in adult sex work remain. The Protocol’s emphasis on “trafficking in persons, especially women and children” continues to be contentious for inviting gender bias and obscuring differences in agency between adults and children, which together with the overt dichotomous definitional divisions between exploitation in sexual versus nonsexual labor contexts, arguably, have contributed to the expansion of neo-abolitionism and a reductive narrative in how the Protocol has been implemented at the national level (see especially Allain 2014; Chuang 2010). Sex workers and migrants speak of being subject to increased state surveillance, workplace raids, and sting operations, often resulting in the detention and deportation of undocumented persons without due regard to their safety or access to legal information and redress (see, e.g., GAATW 2007). There is also growing concern about the failure of governments to prevent human trafficking and address the complex structural economic, cultural, social, and political factors that contribute to trafficking in persons. Almost all state efforts to reduce demand at the national level have focused on reducing the demand for prostitution via the asymmetric criminalization
of clients, third parties, and advertising with little attention to reducing demand in non-sex labor sectors (Special Rapporteur on trafficking in persons, especially women and children 2013). In this regard, there is an apparent disconnect at the national level where anti-trafficking laws are increasingly used to police domestic sex work, often with few evident connections to organized or transnational crime, via a proliferation of asymmetric criminalization models and despite ongoing serious concerns about prohibitionist models for regulating sex work (Chuang 2010). Equally troubling, the Protocol’s victim protections have been translated into protectionism that sees all women and children in migration situations as “vulnerable” and lacking agency resulting in the introduction of gender-biased national laws and policies limiting the mobility of women and girls to leave or to enter another country on the pretense of preventing their abuse and exploitation (see, e.g., Chacón 2010; GAATW 2007, 2010) (A number of States now deny exit or entry visas for persons wishing to migrate but who are (arbitrarily) deemed at risk of trafficking or exploitation in the workplace. These laws and policies are gendered (directed at women and girls) and are occupation specific (directed at commercial sex work) resulting in a limitation on women and girl’s mobility rights, which was a main concern when the Protocol was being negotiated, that it not adversely affect mobility rights or result in gender discrimination. Problematically, there is an absence of data on how these measures are being enforced in practice. See, e.g., Daly’s 2017 analysis of Canada’s controversial Preventing (Migrant) Workers from Abuse and Exploitation immigration regulations permitting visa officials to deny temporary work visas and which are clearly directed at “protecting” foreign national women and girls ages 15–21 who are thought to be vulnerable to trafficking (i.e., suspected to be coming to Canada to work in the commercial sex sector broadly defined) from migrating). For these reasons, the UN Special Rapporteur has recommended the removal of the “especially women and children” language from the Protocol (Ezeilo 2014).

Finally, in view of prioritizing criminalization over the human rights of victims, the few empirical evaluations that have been conducted raise serious concerns about the unintended effects or harms of the Protocol and national anti-trafficking laws and measures on the human rights of trafficked persons (see, e.g., O’Doherty et al. 2018).

Although there is some intergovernmental guidance (e.g., UNODC and IOM), a lack of clear and consistent legislatively prescribed guiding criteria to identify and distinguish trafficking victims from smuggled persons and the absence of non-prosecution laws and policies in most countries have resulted in the arrest, prosecution, detention, and deportation of trafficked persons and migrants (Chuang 2010; GAATW 2007; 2010; Gallagher 2015). Governments and some NGOs have been implicated in aggressive and racialized law enforcement (raid, rescue, and rehabilitation) campaigns resulting in the traumatization and criminalization of trafficking victims (Ahmed and Seshu 2012; Bernstein 2010; Chuang 2010; Ditmore and Thukral 2012; GAATW 2007; Gallagher 2015; Kaye 2017; Kotiswaran 2014; Soderlund 2005). Both state and non-state actors have been implicated in the forcible detention of trafficking victims in several countries (GAATW 2007; Gallagher and Pearson 2008). There is little evidence that trafficked persons are being afforded the right to an effective remedy, especially restitution and compensation. And, the
provision of state support and assistance is often conditional on a victim’s cooperation in criminal proceedings (Ezeilo 2014; ICAT 2016). Consequently, a number of jurisdictions have introduced laws permitting trafficking victims to seek legal remedies by privately suing their traffickers and others (e.g., businesses) profiting from their exploitation in civil proceedings. Some trafficking victims have now successfully sued governments for human rights violations associated with aggressive enforcement and/or a failure to provide protection and assistance (see, e.g., ECHR 2018). To date, few governments have introduced recovery or reflection periods or offer temporary or permanent residency options to trafficked persons (ICAT 2016). There continue to be major concerns around safety, privacy, and the secondary victimization of trafficking victims in criminal proceedings and the forced return and revictimization of victims who are repatriated to their country of origin (GAATW 2007; Gallagher 2015; Wijers 2015).

As was also expected, the Protocol’s preventative border control measures have contributed to numerous countries implementing tighter border controls making safe migration more difficult (Kempadoo et al. 2017), potentially contributing to irregular migration and trafficking in persons (GAATW 2007). Some scholars assert that anti-trafficking laws are being used as a pretext for increased criminalization and border controls (Kempadoo et al. 2017). The unfortunate and paradoxical result is that such controls likely increase smuggling and trafficking, as well as surveillance of immigrants and refugees (Hathaway 2008). The convergence of criminal and immigration law, referred to as “crimmigration” increases criminal consequences of immigration law including deportations, employing criminal consequences for immigration-related conduct, expanding the grounds for exclusion of refugees and other would-be migrants, the use of detention with limited due process guarantees, and even restrictions on health and other benefits to immigrants and refugees (Stumpf 2006). Crimmigration is also notable in the heavily criticized distinction between human smuggling and human trafficking: law enforcement and border officials can subjectively and arbitrarily determine who is “trafficked” and therefore entitled to protections and who is “smuggled” or undocumented and therefore subject to detention and deportation (see, e.g., Chacón 2010; Chuang 2010; GAATW 2007, 2010).

Determinations are often based on a subjective and rigid definition of “consent” without consideration of the constraints and vulnerable contexts in which some migrants make risky choices and without consideration of changing relationships whereby a person can move from a consensual participant in an irregular border crossing to a situation of labor exploitation and unsafe working conditions once in a country with precarious or no legal status. Border securitization and criminal-type consequences that hinge on initial consent increase the position of power over vulnerably situated laborers and decrease the likelihood of reporting trafficking or other forms of exploitation or violence to the authorities (see, e.g., Chuang 2010).

Individually and collectively, these various deficits associated with the Protocol and its national implementation are now prompting an international discussion of a state obligation to “exercise due diligence” in preventing trafficking; to investigate, prosecute, and punish traffickers; and to “rescue” victims and provide for their protection and access to remedies while not violating their human rights and
fundamental freedoms. There is also growing international and national interest in combating trafficking and exploitation in the context of global supply chains.

**Summary**

The politicization of law is glaringly apparent under all debates about the effectiveness and utility of the Trafficking Protocol. The Protocol is perceived by some as aligned with a neo-abolitionist expansion of anti-immigrant and anti-prostitution criminal prohibitions. Article 9.5 calls on States parties to adopt or strengthen legislative or other measures “to discourage the demand that fosters all forms of exploitation of persons, especially women and children, that leads to trafficking,” and the foreign policy efforts of the USA via its Office to Monitor and Combat Trafficking in Persons are known to have exerted political pressure on countries to adopt neo-abolitionist laws. These laws contribute to the ongoing stigmatization and a lack of safety for sex workers. Criminal prohibitions prevent sex providers from properly screening potential clients and drive the industry further underground, lower violence reporting rates, and create barriers for sex workers to access civic, human, labor, and health rights (Kempadoo et al. 2017). Further, anti-prostitution or neo-abolitionist laws support an anti-trafficking reductive (and dichotomous) narrative focusing on sex sector trafficking to the exclusion of other forms of trafficking.

Equating trafficking with prostitution allows for the pursuit of the abolition of prostitution under the banner of trafficking (GAATW 2010). This is problematic for many reasons, but at its core, it oversimplifies trafficking and inappropriately represents this complex human rights problem. Simplistic anti-trafficking messaging distorts the structural globalization problems related to migration, labor, and unequal access to socioeconomic and political rights and opportunities as a moralized and individualized problem of sexual violence against women and girls (Cruz 2018). This allows States to engage in aggressive criminal justice and immigration responses while ignoring the need for a broader range of interventions, such as better (safe) migration and labor rights frameworks or socioeconomic policies to counter the negative effects of globalizing trends that drive people to undertake risky migration projects in the first instance and that impact marginalized and disadvantaged persons at significantly higher rates than others.

Rather than resulting in a decline in human trafficking and improvement in the lives of victimized persons, the available evidence only demonstrates individualized and ever-expanding criminalization of mostly sex sector activities and migratory movements. Sex workers report increased interventions and surveillance, the closing of safer spaces in which to work, fewer options for communication about their work, and increased marginalization. Enforcement patterns are clearly racialized and gendered (Cruz 2018; Hua 2011; Hunt 2015; Kaye 2017; Kim and Jeffreys 2013). Nonsexual labor exploitation, which is estimated to be more prevalent than sex trafficking (ILO 2012), and failure to address sexual exploitation in other labor sectors (widely documented in relation to migrant labor in the agriculture and domestic work sectors) further demonstrate the inherent limitations of the current
anti-trafficking regime. Criminal law is a notoriously blunt instrument to address highly complex social problems; moreover, criminal justice responses intersect with immigration laws to increase risk and vulnerability in the migration processes, particularly for would-be migrants in contexts of vulnerabilities.

Unfortunately, the harms associated with anti-trafficking legal efforts simply do not outweigh States parties’ concerns about border security and sovereignty. If States parties and the international community are serious about human rights protections, then they must acknowledge the conflict that exists when seeking to advance human rights within systems of enforcement and crimmigration. As a starting point, alternative mechanisms that decriminalize the lives of migrants, sex workers, precarious workers, and other individuals facing heightened forms of insecurity from anti-trafficking interventions are needed alongside sustained interrogation of vulnerabilities (re)produced in a neoliberal and inequitable capitalist global structure.

Abstract

The chapter describes the process that led to the adoption of the UN Trafficking Protocol as an instrument of transnational criminal law and comments on its most debated aspects, including the adoption of the first definition of trafficking in persons in an international treaty, the thin line separating trafficking in persons from the smuggling of migrants, and the scarce measures aimed at protecting victims. The problematic aspects, loopholes, and lack of effectiveness and consistency in the UN Trafficking Protocol are discussed.

The Adoption of the UN Trafficking Protocol as an Instrument of Transnational Criminal Law

The Protocol to Prevent, Suppress, and Punish Trafficking in Persons, especially Women and Children (hereinafter the UN Trafficking Protocol) annexed to the Convention against Transnational Organized Crime was opened for signature at the High Level Political Signing Conference – attended by delegates from 148 countries – held in Palermo (Italy) in December 2000. It entered into force only 3 years after, namely, on 25 December 2003. The Convention against Transnational Organized Crime (CTOC) entered into force on 29 September 2003 and it was also supplemented by the UN Protocol against the Smuggling of Migrants by Land, Sea, and Air (hereinafter the UN Smuggling Protocol) that entered into force on 28 January 2004. A third additional Protocol on Trafficking in Firearms was also added to the CTOC, but it is not taken into consideration by this study.

As of 14 December 2018, the CTOC has reached quasi-universal coverage; with 189 States Parties, the UN Trafficking Protocol follows with 173 ratifications and the UN Smuggling Protocol has collected 147 instruments of ratification. In October 2018, when opening the ninth session of the Conference of the Parties to the CTOC, Yury Fedotov, Executive Director of the United Nations Office on Drugs and Crime (UNODC), urged States Parties to strengthen their cooperation in this field, but also indicated that “the Convention and its Protocols have more than stood the test of time” (UNODC 2018). Besides the considerations on the overall framework, which is not examined by this study, it is also undeniable that the new anti-trafficking regime has generated much discussion, with scholars being divided among some who severely criticize it (Hathaway 2008; Chuang 2014; Allain 2014; Kotiswaran 2017) and others who fiercely defend it (Gallagher 2009). Therefore, 18 years after the adoption of the new anti-trafficking regime and 15 years after its entry into force, the time seems right for an overall assessment of its consistency, effectiveness, and of its shortcomings.

The process that led to the adoption of the CTOC and of its Protocols was set in motion by the 1994 Declaration of the Ministerial Conference of Naples, recognizing the need to adopt an international convention against transnational organized crime. As a follow-up, the General Assembly appointed in 1997 an Open-Ended Intergovernmental Group of Experts entrusted with the task of preparing a draft convention (General Assembly 1997) and subsequently decided to establish an Open-Ended Intergovernmental Ad Hoc Committee on the Elaboration of a Convention against Transnational Organized Crime that, by the end of 2000, would elaborate a treaty against transnational organized crime and would further discuss the elaboration of treaties dealing with “...trafficking in women and children, combating the illicit manufacturing of and trafficking in firearms, their parts and components and ammunition, and illegal trafficking in and transporting of migrants, including by sea.” (General Assembly 1999: 3). It is noted that the focus of the mandate given by the UN General Assembly to the Ad Hoc Committee was ambiguous in regard to human trafficking and to what was later labeled the smuggling of migrants; the same term – namely, trafficking – was, in fact, used to identify
both the offences (Scarpa 2008). Moreover, it was also unfortunate that the drafting of a human trafficking treaty was not to be conducted under the slavery or human rights umbrellas but under the one of the fight against transnational organized crime. Eloquently, the UN Special Rapporteur on Violence against Women, Radhika Coomaraswamy, expressed her concerns about this issue, stating that:

[T]he first modern international instrument on trafficking is being elaborated in the context of crime control, rather than with a focus on human rights. [This is] a failure of the international human rights community to fulfil its commitment to protect the human rights of women. (UN Special Rapporteur on Violence against Women 2000: 7)

During the negotiations process, a preliminary draft of the UN Trafficking Protocol was initially submitted by the United States of America and it was subsequently integrated with additional elements proposed by Argentina (General Assembly 2000). This draft text was used by the delegations for finding consensus on a final document. It is also important to remember that the negotiations of the UN Trafficking Protocol generated much interest in non-governmental organizations (NGOs) and some of them participated in the negotiations of the UN Trafficking Protocol. They were subdivided into two groups: the International Human Rights Network and the Human Rights Caucus (Scarpa 2008). The two groups – namely, the radical feminist and the sex workers ones – promoted two different feminist approaches to prostitution, to the relationship between prostitution and the exploitation of prostitution and, consequently, to trafficking in persons for the purpose of sexual exploitation. Therefore, the NGOs included in the International Human Rights Network lobbied for a radical feminist view to be incorporated into the UN Trafficking Protocol by claiming that it is not possible to distinguish between forced and voluntary prostitution, since prostitution always amounts to a forced activity that, therefore, colludes with human trafficking (Raymond 2002). Within this view, even an adult cannot consent to prostitution, since the latter is in itself a violation of human rights akin to slavery (Scarpa 2008). Therefore, the International Human Rights Network lobbied to obtain a definition of trafficking in persons that would not have distinguished between victims who can demonstrate they were forced and those who cannot. Consequently, they sustained the irrelevance of adult victims’ consent when one of the improper means (including not only force, but also other lesser situations of vulnerability) had been used (Raymond 2002). On the other hand, the Human Rights Caucus promoted the sexual workers approach and lobbied for maintaining the distinction between free and forced prostitution (Scarpa 2008). This approach favors a view of prostitution as free sex work. For this reason, this group of NGOs lobbied to consider consent as a relevant issue and to omit the term “victim” from the text of the Protocol, substituting it with “trafficked person” as a form of empowerment (Ditmore and Wijers 2003; Doezema 2002).

The different feminist approaches to prostitution and the corresponding positions of States was an issue that was debated at length during the negotiation process of the UN Trafficking Protocol. States’ representatives were also divided between these
two divergent views. However, it was also widely felt that it was necessary to avoid that the UN Trafficking Protocol would end up attracting a limited number of ratifications as it had happened to the Convention for the Suppression of the Traffic in Persons and the Exploitation of the Prostitution of Others adopted by the United Nations in 1949, which promoted an abolitionist approach against prostitution (Scarpa 2008). Therefore, according to Gallagher, “States merely agreed to sacrifice their individual views on prostitution to the greater goal of securing an agreed definition and maintaining the integrity of the distinction between trafficking and migrant smuggling” (Gallagher 2010: 28–29). Whether the two “greater goals” indicated by Gallagher represent good results is, however, questionable and it is further analyzed below.

Thus, it is not surprising that the final text of the UN Trafficking Protocol is a compromise treaty only composed by 20 Articles and that it surely constitutes the least achievable common denominator among the States that participated to the drafting process. The next sections discuss the most debated elements of the UN Trafficking Protocol, namely, the definition of the phenomenon and its distinction from the smuggling of migrants and the measures aimed at assisting trafficking victims. It is worth noting that protection measures are part of the UN Trafficking Protocol’s so-called 3/4-Ps approach, which also includes common measures designed to prevent and combat human trafficking and to promote co-operation among States Parties. However, since these measures were not subjected to serious criticism, they are not examined in this study.

The Definition of Trafficking in Persons

The adoption of the UN Trafficking Protocol in December 2000 introduced the first internationally recognized definition of the concept of trafficking in persons. The definitional complexity inherent in the UN Trafficking Protocol is immediately apparent if one considers that actually two definitions are respectively adopted for trafficking in adults and for child trafficking and the difference between them has to do with vitiated consent and the connected improper means used by traffickers on victims. Therefore, Article 3(a) of the UN Trafficking Protocol defines trafficking in adult persons as a process comprising:

1. The “recruitment, transportation, transfer, harbouring or receipt of persons”;
2. the use of improper means – namely, “the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person”;
3. the purpose of exploitation. Among the forms of exploitation, the trafficking definition specifically mentions “... the exploitation of the prostitution of others or other forms of sexual exploitation, forced labour or services, slavery or practices similar to slavery, servitude or the removal of organs.”
Article 3(b) further clarifies that if one of the means set forth in Article 3(a) is used, it is irrelevant whether the persons expressed their consent or not. The issue of consent was a difficult one to overcome during the negotiations of the UN Trafficking Protocol because of the above-mentioned different positions of States on the issue of prostitution/the exploitation of prostitution. The prevailing idea was, in the end, considering consent irrelevant only if one of the means listed in the definition is used to convince an adult victim (Scarpa 2008). Consequently, the Legislative Guide for the Implementation of the UN Trafficking Protocol acknowledges that: “Once it is established that deception, coercion, force, or other prohibited means were used, consent is irrelevant and cannot be used as a defence” (UNODC 2004). On the contrary, the definition of trafficking in minors contained in Article 3(c) does not take into consideration the issue of consent and improper means, so that the two-phases process of the recruitment, transportation, transfer, harboring and receipt of a child for the purpose of exploitation amounts to child trafficking.

The definition of human trafficking is problematic for various reasons. First of all, the use of the term “trafficking” suffers from the complexity of its historical heritage and strict connection with only one form of exploitation that is sexual exploitation and the thorny issue of consent in prostitution. The concept of “trafficking” constitutes in fact an evolution of the term *traffic*, which since early in the nineteenth century had been used to refer to the *white slave trade or traffic* phenomenon, namely, the abduction of European adult women and young girls, their transportation abroad, and their final exploitation in brothels. Four main international treaties were adopted early in the twentieth century for the purpose of fighting against this phenomenon, namely: the 1904 International Agreement for the Suppression of the White Slave Traffic; the 1910 International Convention for the Suppression of the White Slave Traffic; the 1921 International Convention for the Suppression of the Traffic in Women and Children; and finally the 1933 International Convention for the Suppression of the Traffic in Women of Full Age. None of them provided a definition of white slave trade or traffic, but they all referred to the procurement of women for “immoral purposes,” which was their common denominator. Significantly, none of the white slave trade or traffic conventions dealt with prostitution per se, which remained a matter of national jurisdiction (Scarpa 2008). Moreover, the 1921 and 1933 Conventions were adopted under the auspices of the League of Nations, which had also promoted the adoption of the 1926 Convention on Slavery aimed at fighting slavery and the slave trade.

The white slave traffic conventions’ scope was consolidated and extended by the 1949 Convention for Suppression of the Traffic in Persons and the Exploitation of the Prostitution of Others, whose adoption was promoted by the United Nations. However, this Convention has only been ratified by 82 States and is regarded by some as being “obsolete and ineffective” (European Parliament 1996). Particularly contested was its choice of the abolitionist model to manage prostitution, so that prostitution per se is prohibited alongside with trafficking for the purpose of sexual exploitation, victims’ penalization is prohibited and consent is always considered irrelevant. Article 1 of the 1949 Convention requires in fact States Parties to: “punish any person who, to gratify the passions of another: (1) Procures, entices or leads
away, for purposes of prostitution, another person, even with the consent of that person; (2) Exploits the prostitution of another person, even with the consent of that person.” Therefore, the different consideration given to the issue of consent clearly distinguishes the 1949 Convention from the UN Trafficking Protocol.

While eight States ratified the 1949 Convention in the last decade, so that this treaty cannot be considered as fully obsolete, its regime remains in place only among a minority of the States of the world. The ethical debate centered on the possibility to distinguish between free and forced prostitution is a key element when discussing the UN Trafficking Protocol’s definition of human trafficking. The different points of view of groups of feminists – the radical feminists and the sex-workers one – and also of States on the issue were hardly reconcilable. Therefore, States Parties remain free to set the boundaries in this area since prostitution is treated as a matter of internal affairs that fully remains within the States Parties’ jurisdiction, leading to an evident lack of consistency in the universal legal approach (Scarpa 2018). This applies equally regionally, since Article 3 of the 2005 Council of Europe Convention on Action against Trafficking in Human Beings, Article 2 of the 2015 Association of Southeast Asian Nations (ASEAN) Convention against Trafficking in Persons, Especially Women and Children, as well as Article 2 of the EU Directive 2011/36/ EU on prevention and combating trafficking in human beings and protecting its victims include definitions of trafficking based on the one included in the UN Trafficking Protocol.

However, the policies in the field of prostitution of the States Parties to the UN Trafficking Protocol might affect human trafficking for the purpose of sexual exploitation, so it would be wrong to believe that the two issues can be kept fully separated. This has been particularly evident in Europe, where countries have adopted different models aimed at dealing with prostitution (Scarpa 2017; Scarpa 2010). Recently, Cho and others conducted an empirical analysis with a cross section of up to 150 countries in which prostitution is legal and concluded that the legalization of prostitution increases trafficking in persons for the purpose of sexual exploitation (Cho et al. 2013). In this respect, it is important to highlight how the recent report by Walby and others at the request of the European Commission proposes that:

Wherever there are legal sanctions to regulate prostitution, the presumption should be that the burden of compliance and of sanctions should be borne first by those that take profits (or rents or fees) from prostitution and second by those that purchase sex, avoiding wherever practical placing sanctions for non-compliance on the sellers of sex. (Walby et al. 2016: 197)

According to the authors of the study, this first step is to be followed by a decriminalization of the sale of sex “as being necessary in order . . . to allow for the reaching of victims to provide them with assistance and to facilitate the prosecution of traffickers and other criminal exploiters” (Walby et al. 2016: 197). A harmonization of States’ legislations along these lines would constitute a first important step not only at the European level but also eventually at the global one, within the framework of the States Parties to the UN Trafficking Protocol.
Secondly, another issue which lacks proper consideration by the UN Trafficking Protocol, as well as more generally by universal and regional efforts aimed at tackling human trafficking, is whether the lack of consistency in the global approach to prostitution, the exploitation of the prostitution of others and other forms of sexual exploitation and human trafficking for the purpose of sexual exploitation – if summed up to the diversity of national laws and policies and to other technical, political, economic and social factors – might indirectly risk contributing to the proliferation of side effects, such as inter alia an increase in sexual exploitation of children in travel and tourism. The role of other factors is clearly emphasized by Capaldi in an ECPAT International’s Report:

The use of new ICTs and other technical and socio-economic developments have also contributed in recent years to a boom in the travel and tourism industries in many regions of the world. Despite a growing awareness of the sexual exploitation of children in travel and tourism, the opening up of new tourism destinations such as in Southeast Asia, Eastern Europe and Latin America is providing new locations for child sex offenders (including the prostitution of street-based boys which is often found as a significant problem in certain tourist resorts). . . . Recent research has shown that travelling sex offenders are moving away from major cities to more remote locations where awareness about sexual abuse and exploitation is lower and a traditional ‘culture of silence’ can contribute to victims and their families not speaking out. (Capaldi 2015: 12)

The link between the lack of a consistent universal approach and the various national frameworks in place in this field would instead require to be further studied and subjected to increased attention by the States Parties to the UN Trafficking Protocol.

Thirdly, the use of improper means necessary to vitiate the consent of adult trafficking victims applies equally to all the forms of exploitation included in the definition, such as slavery, practices similar to slavery, forced or compulsory labor, servitude, the exploitation of the prostitution of others, and other forms of sexual exploitation and the removal of organs. However, it is to be noted that the trafficking framework includes for the first time various prohibitions having both an absolute and relative nature under international law in a process-oriented crime. While in fact slavery and the practices similar to slavery are defined in the 1926 and 1956 Conventions as absolute prohibitions, the prohibition of forced or compulsory labor is relative, since relevant exceptions are included in Article 2(2) of the ILO Convention No. 29 – including military service for work of purely military character, normal civic obligations, work of convicted prisoners, work in emergencies and other minor communal services – as well as in Article 8.3(b) and (c) of the 1966 International Covenant on Civil and Political Rights (ICCPR), Article 4.3 of the 1950 European Convention on Human Rights (ECHR), and Article 6.3 of the 1969 American Convention on Human Rights (ACHR). Moreover, such distinction between absolute and relative prohibitions is also mainstreamed in international human rights law since no interference, limitation or exception is allowed to the prohibitions of slavery and servitude and they are considered nonderogable even in situations of public emergency threatening the life of the State by Article 4.2 ICCPR,
Article 15.2 ECHR and Article 27.2 ACHR (see Chap. 9, “The Nebulous Definition of Slavery: Legal Versus Sociological Definitions of Slavery”). Notwithstanding this distinction, an analysis of these practices shows potential clashes between the ways in which the definition of trafficking in adults takes into consideration the issue of consent and how they are defined or interpreted according to international treaty law (Scarpa 2013). In particular, if the focus tends to be disproportionally placed on consent, the inclusion of practices—such as slavery, the practices similar to slavery and servitude—that are founded on absolute prohibitions among the forms of exploitation becomes extremely problematic (Scarpa 2013). On one hand, in fact, slavery, debt bondage, and serfdom are defined in the 1926 and 1956 Conventions in such a way so that they include both voluntary and involuntary practices; servitude is left undefined by international treaty law, but still it is worth remembering how, during the drafting process of the 1948 Universal Declaration of Human Rights, the Third Committee of the General Assembly of the United Nations believed that it was necessary to eliminate servitude whether it was voluntary or not, as a way to avoid offering to slave holders the possibility of arguing that their victims had voluntarily accepted such a condition (General Assembly 1948). On the other hand, the practices regarding women included in Article 1(c) of the 1956 Supplementary Convention on the Abolition of Slavery, the Slave Trade and Institutions and Practices Similar to Slavery are defined in such a way so that the decision regarding their fate is taken by someone else and, secondly, that the final outcome of the decision—the marriage, the transfer or the inheritance of the woman—cannot be challenged by them, so that consent is absent. These conclusions clash with the definitional framework of trafficking in adults, given the inclusion of a second element of vitiated consent and the use of improper means (Scarpa 2013). In addition to this, additional problems arise with legal concepts having a relative nature, such as forced or compulsory labor; if in fact coercion and involuntariness are already elements of the crime of forced or compulsory labor, the relevance of the other improper means included in the trafficking framework is deemed to be scarce or nonexistent (Scarpa 2013). Moreover, given its specificity and fundamental difference from all the other exploitative practices, the issue of organ removal should have deserved more attention during the drafting process and the provision of additional measures within the UN Trafficking Protocol. While the Council of Europe recently adopted the 2015 Convention against Trafficking in Human Organs, as a way of filling in many of the loopholes existing in this field, the treaty—which is open for signature and ratification by both CoE Member States and Non-Member States—has so far only collected six ratifications.
States Parties to the Trafficking Protocol are aware of the complexity of the issue of consent. In 2010, the Working Group on Trafficking in Persons established by the Conference of the Parties to the Convention against Transnational Organized recommended that clarifications be provided inter alia on this issue (Working Group on Trafficking in Persons 2010). This led to the adoption by UNODC of an issue paper on consent drafted by Gallagher, which confirms the problematic nature of this issue, the variety of approaches adopted by States Parties and the impossibility for the victim to consent when his/her inalienable rights are at stake; according to the author these include rights to the prohibitions of slavery, servitude, and forced labor (Gallagher 2014).

Fourth, the first element of the trafficking definition, namely, the action, comprises various activities, including the “recruitment, transportation, transfer, harboring, or receipt of persons.” None of these terms is defined in the UN Trafficking Protocol, which is in itself a problematic issue, but – as stated above – each one of them is sufficient if combined with the purpose of exploitation (for minors) and with both an improper means and purpose of exploitation (for adults) for establishing the offence of human trafficking (UNODC 2004). In this respect, the inclusion of concepts (such as recruitment, harboring, and receipt) that are not connected with the idea of “movement” is considered as positive (Scarpa 2008; Gallagher 2010). In this way, cases in which victims are not moved but simply recruited or harbored or received from others – if the other elements of the definition are also met – are to be considered as human trafficking ones. However, scholars such as Allain (2014) and some States Parties to the UN Trafficking Protocol fail to recognize this issue. Consequently, the definition’s potential broad interpretation that goes beyond movement is to be promoted. Unfortunately, it is to be noted that since movement was intrinsic in the concept of traffic/trafficking used at the supra-national level before the adoption of the UN Trafficking Protocol, the promotion of a new broader interpretation might prove challenging.

Fifth, the interpretation of the improper means, namely, “the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person” included in the second part of the definition of trafficking in adults also generated much discussion (Gallagher 2010). None of them are defined in the UN Trafficking Protocol and limited guidance has been offered to States Parties on how to reproduce them into their national legal frameworks.

Sixth, the UN Trafficking Protocol’s trafficking definition also suffers from the complexity inherent in the fact that – besides the exploitation of the prostitution of others – it incorporates various other exploitative practices, including slavery, the practices similar to slavery, forced or compulsory labor, servitude, and the removal of organs. None of them is defined by the Protocol, even if at least some of them (including, slavery, the practices similar to slavery, and forced or compulsory labor) were already defined by other treaties. However, the interpretations of all the definitions – for both defined and undefined concepts in international treaty law – are problematic and contours as well as overlaps among the various concepts remain
unclear (Scarpa 2018). Issues arise also in terms of the status of the prohibitions of these practices from the point of view of the sources of international law, with only the prohibition of slavery being widely considered as a peremptory norm of international law (*jus cogens*). Given this already problematic framework, the Trafficking Protocol’s definition connects for the first time these concepts with a *process-oriented crime*. This process, however, can be long and actions can happen in different moments and places – as including across borders – thus potentially rendering the prosecution of trafficking cases more complex than, for instance, the one of slavery or forced labor issues (Scarpa 2018).

Additionally, the concept of “exploitation” included in the UN Trafficking Protocol remains undefined and the list of exploitative practices listed in the definition is nonexhaustive (Scarpa 2008). Consequently, it is clear that the door remains open for further exploitative practices to be eventually added at universal, regional, and national levels. While, on one hand, the possibility of amending the definition included in the UN Trafficking Protocol exists, it is not believed that it is an appropriate solution to the definitional challenges existing in this area of international law. However, on the other hand, it is possible that in the near future a universal customary concept of exploitation different from the one included in the UN Trafficking Protocol is developed. At the European subregional level, Articles 2 (1) and 2(3) of the Directive 2011/36/EU have already broadened the UN Trafficking Protocol’s concept of exploitation by adding other forms, namely, begging and criminal activities to the list. Moreover, the Preamble of the Directive also refers to illegal adoptions and forced marriages. Finally, practices that might be included in the definitional framework of human trafficking at the national level are, for instance, early and forced marriages; serious labor exploitation in agriculture, construction, mines, factories, fishing, etc.; the use of the victims in illicit activities, in circuses, races, etc.; forced street begging; domestic exploitation; the use of victims in armed conflicts; practices of child illegal adoptions for exploitative purposes; the use of women for forced commercial surrogacy (Scarpa 2008; European Parliament 2016; European Parliament 2011). On a parallel level, it is, however, legitimate to ask whether only severe practices deserve to be included in the definition of trafficking or if States Parties remain free to set the boundaries of the concept of “exploitation,” with an evident risk of diluting the nature of the prohibition of a serious crime (Kotiswaran 2017). This issue clearly contributes to increasing the complexity of the trafficking framework and further diluting its consistency too.

Finally, highly debated was the fact that Article 4 of the UN Trafficking Protocol inevitably limited its scope of application “to the prevention, investigation, and prosecution of the offences established in accordance with Article 5 . . . where those offences are transnational in nature and involve an organized criminal group, as well as to the protection of victims of such offences.” The UN Trafficking Protocol was initially criticized for narrowing human trafficking only to the situations where these two elements are met. Therefore, both internal trafficking without any transnational element, which is widespread in some countries of the world, and the one organized by individuals or groups of two people or by groups that cannot be
considered as structured ones would have risked being excluded from the UN Trafficking Protocol. However, the UNODC Legislative Guide clarified that “the Trafficking in Persons Protocol also applies to the protection of victims regardless of transnationality and involvement of an organized criminal group” (UNODC 2004). The same conclusion can be reached by jointly taking into consideration Article 34 CTOC and Article 1 of the UN Trafficking Protocol. This implies that States Parties shall introduce in their criminal legislations the crime of human trafficking, regardless of transnationality or the involvement of criminal organizations and they cannot discriminate between victims of internal and transnational trafficking, as well between the ones exploited by a structured group – as defined by the Convention against Transnational Organized Crime – or by an individual or any other kind of group. The minimum protection – examined below – provided by the UN Trafficking Protocol shall, consequently, be granted to all victims of human trafficking. Notwithstanding the UNODC Legislative Guide’s clarification, it is evident that the trafficking definition and anti-trafficking action both suffer from the framework within which they were promoted. The latter is based not only on “an interest in suppressing crimes against the person, such as enslaving or trafficking a person, but [on] a preoccupation with irregular migration and a determination to prioritize crimes related to migration, rather than focusing on the rights of migrants or even violations of the human rights of migrants” (Dottridge 2017: 63). This issue continues to severely affect the implementation of the UN Trafficking Protocol.

The UN Trafficking Protocol’s definition represents a complex compromise among the States’ representatives that participated in the negotiations. The concept of human trafficking for multiple forms of exploitation has the potential to be broadly interpreted as covering the greatest majority of exploitative practices existing today (Scarpa 2008; Gallagher 2010). However, a rigid interpretation of such a framework that places too much emphasis on vitiated consent (for adults), and focuses more on the process than on the exploitative outcome does not support the aim of including most of the forms of exploitation existing today within the human trafficking umbrella and instead risks its being undermined (Scarpa 2018). Moreover, the UN Trafficking Protocol’s definition extends the boundaries of the phenomenon, recognizing that trafficking is connected to various forms of exploitation and that men, women, and children can be trafficked. While the boundaries of the definition remain fuzzy and unclear, the trafficking framework founded on the UN Trafficking Protocol’s definition stands today as one of the three fundamental regimes – including the ones on slavery and practices similar to slavery and on forced and compulsory labor – against serious forms of exploitation. It is also to be acknowledged that the interpretation of the concept has not so far been devoid of politicization; especially in some countries, such as the United States, an “exploitation creep” has been noticed, so that:

... diverse advocates have appropriated the “trafficking” label so that the activities covered by the term trafficking remain very much in the eye of the beholder. The definitional muddle has resulted in indiscriminate conflation of legal concepts, heated battles over how best to address the problem, and an expanding crowd of actors fervently seeking to abolish any conduct deemed “trafficking.” (Chuang 2014: 610)
Finally, the various forms of exploitation included in the trafficking framework have received various degrees of attention. Sexual exploitation has been the predominant issue in trafficking discourse for almost a decade since the adoption of the UN Trafficking Protocol. Subsequently, “[f]rom around 2012 onwards, trafficking became increasingly reframed in terms of both slavery and forced labour” (Kotiswaran 2017: 18), with increased attention for labor exploitation and global supply chains. However, many other forms of exploitation connected to human trafficking are still waiting to receive the necessary level of attention which would be needed for seriously tackling them.

The (Thin) Line Between Trafficking in Persons and the Smuggling of Migrants

As stated supra, the UN Convention against Transnational Organized Crime is also supplemented by a Protocol on the smuggling of migrants by land, sea, and air. Article 3(a) of this treaty defines the smuggling of migrants as: “the procurement, in order to obtain, directly or indirectly, a financial or other material benefit, of the illegal entry of a person into a State Party of which the person is not a national or a permanent resident.” The adoption of the UN Smuggling Protocol was determined by the deficiencies in the universal system of international law aimed at targeting those who profit from the facilitation of irregular migration at a time in which some States, including in particular those in Western Europe and North America, were increasingly worried about this phenomenon (Gallagher 2015).

While certain key differences are clearly apparent from the comparison between the definitions of human trafficking and migrant smuggling, the “theory” in this field does not fully match the reality, so that serious overlaps between the two exist (Bhabha and Zard 2006; Scarpa 2008). UNODC clarifies that there are three main differences between the two definitions and they have to do with consent, exploitation and transnationality. As regards the first issue, namely, consent, as stated above, the UN Trafficking Protocol’s definition presupposes that consent of adult trafficking victims is vitiated by the use of improper means. However, consent is considered irrelevant in the case of minors. Consequently, the UN Trafficking Protocol considers trafficked persons as “victims.” Differently, the UN Smuggling Protocol considers smuggled persons as migrants who freely decide to buy an illegal transportation service from a smuggler to reach their desired destination while crossing borders irregularly. Moreover, the UN Smuggling Protocol’s definition of smuggling presumes that the relationship between the smuggler and the smuggled migrant ends once the latter arrives at destination. Exploitation is another key difference: the UN Trafficking Protocol’s definition considers the latter as the ultimate outcome of the trafficking process and a fundamental element within that framework. The UN Smuggling Protocol’s definition instead does not include any reference to exploitation, assuming as stated above, that the relationship between smuggler and smuggled person ends once that migrants arrive at their destination. However, Article 6.3(c) of the UN Smuggling Protocol allows States Parties to introduce aggravating circumstances for the criminal offence
of smuggling of migrants and includes exploitation among them. Finally, the last difference between the two offences is that smuggling in migrants always takes place across national borders, although this is not always the case for trafficking in persons. Therefore, smuggled migrants are always irregular immigrants while trafficked persons can both be trafficked internally and transnationally and in the latter case, they may have entered into the State of destination both legally or irregularly.

Even if theoretically the above-mentioned three elements should allow to clearly distinguish between trafficking in persons and the smuggling of migrants, in reality the two phenomena may well overlap, as there is a considerable grey area between them. Traffickers and smugglers might adopt the same routes for their illegal activities, so that “clients” and “victims” may travel together and the difference between them may not be apparent to border guards. Furthermore, it is always possible that smuggled migrants may find themselves in difficulties leading to a condition of exploitation. On the other hand, trafficked victims travelling across borders risk being conflated with irregular/smuggled migrants, so that if they are not properly identified they lose access to the minimum protection measures included in the UN Trafficking Protocol (Scarpa 2008; Gallagher 2010). The UN Smuggling Protocol in fact contains on a comparative perspective lesser measures dealing with the protection of smuggled migrants. Moreover, smuggled migrants might end up being trafficked and/or exploited at their destination because of their irregular entry and the consequent lack of documents, which does not allow them to apply for regular jobs. Therefore, it is believed that the two phenomena should be considered as partially intersecting, with full consideration of their unclear contours and serious overlaps (Scarpa 2008).

The (Scarce) Protection of Trafficking Victims

Given that the UN Trafficking Protocol is a transnational criminal law instrument primarily designed to punish human traffickers, it should not be surprising that it contains only three articles dedicated to victims’ protection and they do not create strong obligations for States Parties. The main reasons behind the discretionary language used in many protection measures are connected with the lack of interest by States’ delegates to enhance the protection of trafficked victims, who were mainly considered as a financial burden or as witnesses deserving only minimum rights. The division between the two groups of NGOs – namely, the Human Rights Caucus and the International Human Rights Network – lobbying during the negotiations was also undermining the final result in terms of victims’ protection (Scarpa 2008).

The provisions on the protection of trafficking victims are included in Section II of the UN Trafficking Protocol, entitled “Protection of Victims of Trafficking in Persons” that comprises articles 6, 7, and 8. Four years after the adoption of the UN Trafficking Protocol, the Legislative Guide adopted by UNODC intervened on the discretionary character of some of these provisions on the protection of trafficked victims. Unfortunately, the Guide clarified that Article 6, paragraphs 3 and 4 on social assistance, victims’ protection, and the special needs of children and Article 7 on the status of victims are optional provisions with no binding effect on the States
Parties. The distinction was made along the lines of first and second generations’ human rights, so that according to the Legislative Guide:

Generally, the provisions of the Protocol setting out procedural requirements and basic safeguards are mandatory, while requirements to provide assistance and support for victims incorporate some element of discretion … The nature of the social obligations reflects concerns about the costs and difficulties in delivering social assistance to all victims (or indeed, the general population) in many developing countries. (UNODC 2004: 283)

Article 6 is the core provision of the Section and it is composed of six paragraphs stating that the Contracting Parties: (1) consider both protecting the identity and privacy of trafficked victims and making legal proceedings related to such offence confidential; (2) if appropriate, adopt in their domestic legal or administrative systems measures designed to provide trafficking victims with information on relevant proceedings and assistance to enable them to testify against their traffickers; (3) examine the possibility of guaranteeing to trafficking victims physical, psychological, and social recovery and, in particular appropriate housing, counselling, and information in a language that they can understand at least on their legal rights, medical, psychological, and material assistance, education, the opportunity to find an employment, and to attend professional courses; (4) take into account the age, gender, and special needs of trafficking victims, particularly those of children, especially relating to housing, education, and care; (5) make efforts to provide for the physical safety of the victims residing in their territory; (6) introduce measures in their domestic systems to guarantee that trafficked victims may obtain compensation for damage suffered. Article 7 suggests that States Parties consider adopting measures to guarantee trafficking victims the right to remain within their territory, temporarily or permanently, giving consideration to “humanitarian and compassionate factors” and, finally, Article 8 contains a set of measures to facilitate the return of trafficked persons to their State of nationality or of permanent residence. The limited approach of Articles 7 and 8 of the Protocol, which is based on a presumption that trafficking victims are irregularly present in the countries of destination, is self-evident.

Even if it is included in the last section of the Protocol, namely, Chapter IV, Article 14, which is dedicated to saving clauses, should also be mentioned among the protection measures. Its first paragraph provides in fact that the UN Trafficking Protocol does not affect existing rights and obligations under international law and, in particular, those provided by international humanitarian law and international human rights law. Specific mention is made of the 1951 Convention relating to the Status of Refugees, of its 1967 Protocol and of the principle of non-refoulement. The latter is a fundamental principle of international refugee law, which is enshrined in Article 33.1 of the 1951 Convention relating to the Status of Refugees, and it provides that States shall not return a refugee or asylum seeker against his/her will to a territory where he/she fears persecution. However, the principle is also included in some international human rights treaties. It is worth mentioning, at the universal level, Article 3 of the Convention against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment (CAT) prohibiting return when there is a fear
that the returned individual might be subjected to torture and Article 16 of the
International Convention for the Protection of All Persons from Enforced Disap-
pearance (ICPPED) for risks of enforced disappearance upon return. At the regional
one, the principle is included in Article 22.8 ACHR if the “right to life or personal
freedom [of the returned individual] is in danger of being violated because of his
race, nationality, religion, social status, or political opinions,” and Article 19.2 of the
Charter of Fundamental Rights of the European Union for risks of death penalty,
torture or other inhuman or degrading treatment or punishment upon return. The
second paragraph of Article 14 of the UN Trafficking Protocol contains a non-
discrimination clause, ensuring that trafficking victims are not discriminated against
and that the UN Trafficking Protocol is interpreted consistently with the well-
established international principles of non-discrimination.

However, the lack of a specific provision on the identification of trafficking
victims in the UN Trafficking Protocol – given the evident risk especially in irregular
transnational trafficking that if not properly identified they might end up being
considered as irregular or smuggled migrants – is evident (Scarpa 2008). Moreover,
the trafficking protection framework has been implemented in some States – includ-
ing in particular, the United States and European countries – through the promotion
of a very limited rescue framework. The latter might work for some trafficking victims,
including in particular, those irregularly within the country of destination who escape
from sexual exploitation and ruthless traffickers, but it does not fit victims possessing
other statuses (citizens, refugees, etc.) and exploited in other sectors.

Conclusion

The UN Trafficking Protocol has been widely criticized for having been adopted
within the framework of the fight against transnational organized crime, to the
detriment of other relevant approaches. The interest of many States Parties, which
is not “merely an interest in suppressing crimes against the person, such as enslaving
or trafficking a person, but a preoccupation with irregular migration and a determi-
nation to prioritize crimes related to migration, rather than focusing on the rights of
migrants or even violations of the human rights of migrants” (Dottridge 2017),
dermines the potential of the trafficking framework.

The problematic nature of the definition of human trafficking and the lack of
clarity on its contours and interpretation add further issues, diluting consistency and
leading to “alternative understandings at the global, national and local levels” (Merry
2017). Scholars, judges, and professionals working in this field have an important
responsibility and role to play worldwide while interpreting the definition, for the
purpose of guaranteeing greater consistency, as well as effectiveness of the global
framework on the fight against human trafficking.

Moreover, since human trafficking is a multifaceted and complex issue, it is
problematic that certain dimensions were not appropriately taken into consideration
by the UN Trafficking Protocol through specific additional measures. These issues
include intersections between human trafficking and (transnational and internal)
migration and refugee protection, the protection of victims’ human rights, children’s rights and gender mainstreaming, concerns about various forms of labor exploitation and their connection to global supply chains, as well as clarifications on organ removal.

However, demonizing the regime by claiming that it is “flawed” (Allain 2014) brings with it many risks, given the outdated nature of the two Slavery Conventions and the limited number of ratifications, namely, 27, received so-far by the new Protocol of 2014 to the Forced Labour Convention.

Notwithstanding all the limitations identified in this chapter, it should also be acknowledged that, on the (limited) positive side, the UN Trafficking Protocol surely represents a landmark achievement if compared to the previous white slave trade or traffic conventions that for nearly a century had condemned the practice but had never defined it. Moreover, it is important to note that the Conference of the Parties to the Convention against Transnational Organized Crime, which was established pursuant to Article 32.1 CTOC, created a Working Group on Trafficking in Persons and, with its resolution 7/1, decided that this is a permanent element of the Conference (Conference of the Parties 2014). The Working Group has been so far actively involved in promoting consistency in the implementation of the UN Trafficking Protocol by the States Parties. Moreover, a process aimed at establishing a reporting mechanism for reviewing implementation of the Convention against Transnational Organized Crime and the Protocols is ongoing; this might constitute an important aspect for favoring a more consistent and coherent approach by the States Parties.

Finally, it is worth noting that, according to Article 18 of the UN Trafficking Protocol, 5 years after its entry into force, any State Party may propose amendments to it. The proposals shall be voted on by the Conference of the Parties and if approved, the amendments are subject to ratification, acceptance, or approval by the States Parties. Therefore, this author fully supports the introduction of additional protective measures for trafficking victims in the near future. These measures could be easily framed, keeping into consideration the ones included in European instruments, such as the Council of Europe Convention on Action against Trafficking in Human Beings and the European Union Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims. In this way, existing loopholes within the universal protection system currently in place with the UN Trafficking Protocol might be eliminated.

**Introduction**

Since the adoption of the *Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children* in 2000, the international community has recognized trafficking in persons as a criminal offense. Since the passage of the UN Protocol, 158 countries have adopted laws that specifically criminalize trafficking in persons (United Nations Office on Drugs and Crime 2016). Critical to the success of these legislative efforts is the ability of criminal justice system authorities to enforce laws against trafficking, necessitating the proper identification of potential victims, effective investigation of offenses, and the prosecution of offenders. This chapter examines the numerous challenges criminal justice systems around the globe face in effectively implementing laws that criminalize trafficking in persons.

**Criminalization Frameworks and Legal Responses**

Human trafficking has primarily been understood by political elites and policymakers across the globe as a crime and security problem. Although early efforts to raise awareness about sex and labor trafficking focused on human rights violations, particularly the harms brought to women and children who had been forced into prostitution (Bryjak 1995; Farrell and Fahy 2009; Jahic and Finckenauer 2005), these concerns had little public resonance. By the mid-1990s, activists and politicians seeking to bring attention to the problem of human trafficking expanded the original definition which focused on forced prostitution to include consensual forms of prostitution as well as labor trafficking (Stolz 2005, 2007). The problem itself was recast as a crime problem involving nefarious predators with connections to transnational crime networks who perpetrate crimes by exploiting vulnerable people (Charnysh et al. 2015). Government officials around the globe have attempted to draw connections between the transnational aspect of human trafficking with efforts to address terrorism and protect national security (Shelley 2002). As a result, human trafficking became intertwined with both criminal control and homeland security efforts (Aradau 2004; Chacon 2006).
Media coverage of human trafficking problems overwhelmingly focuses on issues of sex trafficking and commercial sexual exploitation, overshadowing other forms of trafficking such as labor trafficking and organ trafficking (Farrell and Fahy 2009; Gulati 2012; Marchionni 2012; Sandford et al. 2016). Furthermore, females and children remain the prominent victims of human trafficking portrayed by the media (Sandford et al. 2016). Sex trafficking and the protection of women and girls also dominate the attention and efforts of legislators and policymakers (UNODC 2014; Weitzer 2007, 2015). Public concern can affect what issues are prioritized by legislation and law enforcement (Dahl 1989; Page 1994; Page and Shapiro 1993; Stimpson et al. 1995). As such, perceptions held by the public about the harms of sex trafficking and the threats to women and children have influenced the distribution of resources and attention of law enforcement efforts to prioritize the identification and interdiction of human trafficking crimes.

Governments around the world have responded to public concern about human trafficking through the passage of laws that criminalize human trafficking offenses and support the criminal justice system in the detection and neutralization of criminal threats. The Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children to the United Nations Transnational Organized Crime Convention was adopted in 2000 and by 2016 had been ratified by over 170 countries (UNODC 2016). The UN Protocol defines trafficking in persons as “the recruitment, transportation, transfer, harboring or receipt of persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation. Exploitation shall include, at a minimum, the exploitation of the prostitution of others or other forms of sexual exploitation, forced labor or services, slavery or practices similar to slavery, servitude or the removal of organs” (UN Protocol, Article 3, 2000). The protocol specifies that the consent of a victim to the trafficking acts is irrelevant if any of the means discussed (i.e., force, coercion, abduction, fraud, deception, abuse of power, position of vulnerability) have been employed and the trafficking of a child under the age of 18 is assumed regardless of the means utilized to facilitate the recruitment, transportation, transfer, harboring, or receipt of the person. The protocol establishes a framework for countries to respond to human trafficking as a crime and commits ratifying states to prevent trafficking in persons, protect and assist victims of human trafficking, and prosecute human trafficking offenders.

As of 2016, 158 countries have passed laws that specifically criminalize trafficking in persons in line with the UN definition (UNODC 2016). Most countries in Western and Southern Europe, the Americas, and East Asia and the Pacific criminalized trafficking in persons between 2000 and 2005. Countries in Northern Africa and the Middle East passed law criminalizing trafficking in persons between 2008 and 2012 (UNODC 2016). In 2000, US Congress introduced the Trafficking Victims Protection Act (TVPA 2000) which federally criminalizes sex and labor trafficking. By 2014, all 50 states had followed suit and enacted laws against human trafficking. Under the TVPA, trafficking in persons is defined as “trafficking in which a commercial sex act is induced by force, fraud, or coercion, or in which the person induced to perform such act has not attained 18 years of age; or recruitment, harboring, transportation,
provision, or obtaining of a person for labor or services, through the use of force, fraud, or coercion for the purpose of subjection to involuntary servitude, peonage, debt bondage, or slavery” (TVPA 2000, Section 103, 8a-b). Similarly, the Protocol to Prevent, Suppress and Punish Trafficking in Persons was adopted by the United Nations General Assembly in 2000 with intentions to create human trafficking legislation throughout the UN. The UN Protocol provided the framework for the Council of Europe Convention on Actions Against Trafficking in Human Beings. The Council of Europe provisions specify protection and support for trafficking victims, including a period of reflection which allows foreign national victims time to escape the influence of traffickers as they decide whether or not they will cooperate with law enforcement authorities (Council of Europe 2006).

Despite its criminalization, human trafficking appears to be under-policed by law enforcement worldwide. The UN Global Report on Trafficking indicates that of the 136 countries that reported data between 2012 and 2014, only 29% of countries had investigated more than 50 cases of human trafficking per year, 23% investigated between 11 and 50 cases, 11% investigated 10 or fewer cases, and 37% either investigated no case or no information was available about investigations (UNODC 2016). The criminal cases identified by law enforcement around the globe follow similar patterns. An overwhelming majority of the victims identified through these investigations were women. Between 2012 and 2014, countries reported over 60,000 identified victims, over 70% of which were female (UNODC 2016). Children are the second most common group of victims identified globally. Although global trends reflect the way human trafficking is framed by the media and political elites, there are some important regional differences that suggest variation in public attention and police enforcement of anti-trafficking laws. In countries of Eastern Europe, Central Asia, and the Middle East, a higher proportion of men are identified as human trafficking victims compared to the global averages, suggesting that civil society and the police identify and recognize more cases of labor trafficking than we see in other regions of the world (UNODC 2016).

Offenders being criminally charged and/or convicted of trafficking in persons crimes are even scarcer. Roughly a quarter of the individuals investigated for a trafficking in person crime are convicted of these criminal acts (UNODC 2016). As a result, countries report few convictions for human trafficking crimes. Of the 136 countries that reported data to the UN for the 2012–2014 period, 40% reported fewer than 10 convictions for trafficking in persons offenses, and 15% did not record a single conviction for trafficking (UNODC 2016). Below we discuss the challenges that face criminal justice institutions in responding to new legal mandates and arresting, charging, and convicting trafficking in persons offenders.

**Challenges to Police Identification of Human Trafficking**

Despite the existence of anti-trafficking laws, police in most countries fail to use these new legal tools. Few human trafficking offenders are identified by the police globally, and even fewer are charged or convicted of human trafficking specific
offenses. In all countries, the disconnect between the estimated number of victims and the number of human trafficking incidents identified and interdicted by the police is significant (UNODC 2016). The police play a vital role in the fight against human trafficking. They identify victims and facilitate their connection with appropriate services and resources, directly deter trafficking offenders through arrest and detention, and dismantle trafficking networks to prevent future victimization. The police play a critical role in disrupting and dismantling human trafficking operations, yet there are a number of challenges within police agencies that impede the identification of human trafficking incidents and complicate efforts to arrest and hold offenders accountable. These challenges include confusion regarding human trafficking legislation and definitions, training gaps, the necessity of proactive investigations, and issues of corruption and complicity with traffickers.

New Mandate for Local Law Enforcement

The passage of new anti-trafficking laws is only the first step to addressing human trafficking. Legislation does little to directly affect the actions of law enforcement, and research on American policing confirms that the police have historically been resistant to legislative change (Bittner 1980; Crank and Langworthy 1992; Edelman 1990, 1992; Grattet and Jenness 2005; LaFave 1965; Lipsky 1980; Manning 1997). Not surprisingly, police officials have received new legal mandates to identify and investigate trafficking in persons with suspicion (Farrell et al. 2014). Research in Europe suggests that government officials have similarly been reluctant to acknowledge trafficking problems in local communities (Arsovskaa 2008). While some of this resistance is a result of a limited capacity to change due to lack of resources and training, these are not the only causes. Police often perceive new laws as “a reflection of political whims, the politicization of law enforcement, and a distraction from basic ‘good police work’” (Jenness and Grattet 2005, p. 337). If agencies do not view legislative changes as legitimate, then they will be less likely to incorporate such changes into their work environment. For human trafficking, this means that despite the passage of new laws criminalizing trafficking offenses, police departments around the globe have not made trafficking enforcement an institutional priority.

Because local citizens often do not perceive human trafficking as a significant issue within their local communities and instead tend to think that trafficking problems are more severe “elsewhere” (see Bouché et al. 2015 for examples of public perceptions in the United States), police officials do not receive significant pressure from the community to identify and rescue human trafficking victims, particularly in comparison to other types of violent and property crimes. Outside of legislative changes, local police officials receive little external pressure to make anti-trafficking efforts a priority.

Additionally, police are less likely to perceive trafficking in persons as a priority when there is little pressure within the agency to change practices. Local police agencies have generally committed few resources to support anti-trafficking efforts. A 2008 survey in the United States indicated that roughly 20% of law enforcement
agencies had received any training on human trafficking, less than 10% had developed internal policies or operating procedures to guide the investigation and response to trafficking in persons, and less than 7% assigned any specialized personnel to investigate human trafficking cases (Farrell et al. 2010). Without the commitment of leadership within a police agency, officers are unlikely to invest the resources and person-hours to identifying crimes that are a low priority.

Police resistance to legal change is not unique to human trafficking. When police have been given legal mandates to respond to new crime problems such as domestic violence and bias-motivated crimes (hate crimes), it has been important for policymakers to ensure accountability measures such as data collection and reporting to overcome institutional resistance and promote the enforcement of new laws (Buzawa and Buzawa 2002; Ferraro 1989; Jenness and Grattet 2005; Nolan and Akiyama 1999). Training is another critical step in facilitating enforcement and improving perceptions among rank and file police officers of the importance of new anti-trafficking laws.

Training Gaps

Despite the creation of anti-trafficking legislation, police remain unfamiliar with the legal definitions of human trafficking provided by the legislative acts (Farrell and Pfeffer 2014; Newton et al. 2008). Confusion regarding human trafficking definitions may lead police to overlook victims or misidentify trafficking cases as other types of offenses (Farrell and Fahy 2009; Srikantiah 2007). In addition to failing to train frontline officers about the basic definitions of human trafficking to help them identify potential victims or criminal incidents, most agencies lack specialized training to prepare officers to properly investigate these crimes. Human trafficking investigations can be more complicated than many crimes facing local authorities (Verhoeven and Van Gestel 2011). Trafficking in persons is a complex crime due to the highly adaptive, multifaceted, and often transnational nature of the offense (Van der Watt and van der Westhuizens 2017). As a result, police responses to human trafficking must similarly be fluid, flexible, and responsive to the changing nature of the criminal enterprise, which may involve partnering with non-traditional stakeholders and cross-border sharing of information and intelligence (Araujo 2011). Such responses are not possible without the proper and necessary training.

Very few agencies have trainings in place to address human trafficking responses (Farrell et al. 2010; Newton et al. 2008). For those agencies that do implement trainings, they are often limited to a select few officers, leaving patrol officers and officers from other departments untrained on the topic (Renzetti et al. 2015). As a result, untrained officers may fail to identify human trafficking even when they are faced with it. Additionally, trainings vary greatly. For example, within the United States, there is significant variation across states in both legal mandates to train the local law enforcement officials and the content and nature of police training on trafficking in persons where it is available (Wilson et al. 2006).
The Need for Proactive Identification

Human trafficking crimes rely on the hidden and often invisible nature of victimization itself. Victims are often prohibited from leaving situations of exploitation or communicating to others about their need for assistance by traffickers making it difficult to alert authorities of their abuse (Srikantiah 2007). Even when victims do become free of situations of exploitation, they often have experienced significant trauma that makes it difficult for them to seek out assistance and provide information to law enforcement (Zimmerman et al. 2008). In other cases, victims fear that contacting the police will result in retaliation by traffickers and/or deportation by local law enforcement authorities. In turn, few victims come forward to report their crimes to the police. Additionally, as human trafficking operations are complex and increasingly professional, victims may not have sufficient information about criminal networks to develop criminal investigations (Gallagher and Holmes 2008). In response to these challenges, police must engage in proactive investigative strategies in order to identify cases of human trafficking. This includes intelligence-generated and police-led investigations that are less reliant on the testimony of a trafficking victim (UNODC 2016). Research in the United States suggests that most police agencies rely on reactive as opposed to proactive approaches. These often include responding to tips received from community members, victim service organizations, and hotline calls (Farrell et al. 2014). Reliance on reactive strategies necessitates strong public awareness and even in the best of circumstances will lead to the identification of only a small number of victims.

Corruption and Complicity with Traffickers

Corruption further undermines law enforcement responses to trafficking in persons in some contexts. The police and other criminal justice system officials may both facilitate and benefit from human trafficking activities (Hughes and Denisova 2001). Corrupt officials promote trafficking through a variety of means. They may allow crimes to remain hidden and unidentified. Research has found that police are sometimes bribed by traffickers with money to overlook the illegal activities going on in their businesses. As McCarthy (2010) found in her study of police responses to human trafficking in Russia, brothel owners may bribe officers with free sexual services. Similarly, investigators, prosecutors, and judges may also be bribed as a way to discourage the investigation and prosecution of trafficking cases (Shelley and Orttung 2005). These actions hide trafficking operations and shield traffickers from being punished even once cases are identified. These actions also affect victim perceptions of police, making them less trusting of law enforcement after seeing officers being serviced as clients, receiving bribes from traffickers, or returning victims to their traffickers (McCarthy 2010; Surtees 2007).

Corruption is a worldwide problem. Among those countries perceived to be the most corrupt, human trafficking efforts are extremely low, and governments are not making significant efforts to improve (Transparency International 2014; US
Department of State (2017). This suggests that corruption is correlated with response efforts. For example, in Mexico, a country ranked by the US State Department as having made efforts to combat trafficking but not yet achieving success, corruption facilitates trafficking in persons operations and shields it from justice. Mexican law specifically prohibits government complicity with human trafficking, but the government has not reported any prosecutions of government employees who were complicit in human trafficking since 2010 (US Department of State 2017). Since corruption likely exists in all countries to some capacity, the identification and investigation of human trafficking cases can be severely undermined by corrupt officials.

Challenges to Investigation

Police are considered the frontline when it comes to identifying victims and perpetrators of human trafficking (De Baca and Tisi 2002). However, their ability to successfully investigate, gather and prepare evidence, and effectuate arrests to hold offenders accountable is more limited.

According to institutional theory of criminal justice, the success of agencies is influenced by their surrounding environments (Crank 1994, 2003; Crank and Langworthy 1992). As such, a lack of institutional resources and external pressures can greatly inhibit the investigation of human trafficking. Some institutional factors that limit the investigation of human trafficking include lack of resources, challenges to victim cooperation, limited ability to address victim needs, and corruption.

Lack of Resources and Need for Multiagency Coordination

As discussed earlier, human trafficking requires a proactive investigative approach. However, a lack of resources limits trainings and agencies’ ability to be proactive. Furthermore, due to human trafficking cases being resource-intensive, police agencies are more likely to focus their efforts on addressing other crimes, opposed to human trafficking, for which they have the resources and training necessary to do so (Farrell et al. 2014). When resources are scarce, trafficking investigators may not be able to pursue strategies which would allow them to gather information on complex criminal networks, instead focusing investigations and interdiction efforts on lower-level criminal operators such as pimps, street-level facilitators, or labor operators as opposed to tackling the principal players in complex criminal networks (Van der Watt and van der Westhuizen 2017).

Additionally, trafficking in persons investigations often begin in the community or country where a victim is identified as being exploited. Important evidence about the recruitment or movement of that victim into the situation of exploitation likely exists in another community or another country where the victim was originally recruited. Gathering such information requires interagency partnerships across regions and international borders. One example of such partnerships is the
US-Mexico Bilateral Human Trafficking Enforcement Initiative. Through this program, law enforcement on both sides of the US-Mexico border share information about trafficking networks, and agencies participating in the effort have apprehended suspects and collaborated to ensure successful extradition (US Department of State 2017).

Multijurisdictional partnerships are also important within a country. In the United States, multijurisdictional anti-trafficking task forces have been utilized to promote training and specialization in the investigation and prosecution of trafficking in persons crimes and to facilitate information sharing across regional partners (Bureau of Justice Assistance n.d.). Research has found that agencies with such task forces or those located within states that have federally funded task forces are more likely to identify cases of human trafficking and make arrests (Farrell et al. 2010). Centralized coordination can also facilitate collaboration across agencies. The human trafficking responses in the United Kingdom are led by the Modern Slavery and Human Trafficking Unit (MSHTU) within the National Crime Agency. The MSHTU coordinates with the Home Office, border police, local police and constable agencies, international law enforcement partners, and nongovernmental organizations to provide technical expertise in human trafficking investigations, analyze data from referrals provided through the National Referral Mechanism to proactively identify human trafficking targets, and support ongoing investigations (National Crime Agency n.d.). These examples suggest cautious optimism that increased resources and dedicated, specially trained personnel can improve the investigation of human trafficking.

The Need for Specialized Investigators

Human trafficking cases are complex. Acts of human trafficking usually are not single events but rather processes that involve multiple offenders sometimes operating in different communities and across country borders.

Despite the potential complexity of trafficking in persons crimes, traditionally police have utilized simplistic investigative tactics, generally drawn from more traditional street crime activities. For example, vice tactics are utilized commonly to expose sex trafficking operations by agencies that do not have specialized or specially trained human trafficking investigators. The utilization of such tactics limits investigations to traditional venues such as the streets, hotels, and the Internet. Not only do these tactics ignore cases that may exist in other venues, they miss connections that exist between street-level offenders and others in the criminal network. Vice tactics also overlook labor trafficking entirely (Farrell et al. 2014). As a result, without specialized investigators involved in proactive investigations, labor trafficking cases almost entirely depend upon tips from community members, victim service providers, and hotline calls in order to reactively investigate concerns about forced labor or labor trafficking (Farrell et al. 2014). These investigative strategies are also less likely to yield information and evidence necessary to support prosecution on trafficking in persons charges.
Securing Victim Cooperation

Because police traditionally rely on reactive investigation strategies to identify victims of human trafficking, the investigation and future prosecution of human trafficking offenders are commonly contingent upon victim cooperation and testimony. This means police are working with victim who in many cases have been underserved by, or had poor relationships with, law enforcement (e.g., migrants, immigrant community member, and poor women and girls).

Police face many challenges when it comes to victim cooperation during human trafficking investigations. Language barriers between victims and law enforcement may create challenges (Baldwin et al. 2011; McCarthy 2010). Additionally, foreign victims may be reluctant to cooperate out of fear of deportation (Farrell et al. 2014; Farrell and Pfeffer 2014). Police sometimes perceive victims as criminals who have engaged in a crime, even if it was the result of their victimization experience (Farrell et al. 2014), and correspondingly treat victims with suspicion during the investigation process or during questioning. Police can become frustrated when victims return to their traffickers after law enforcement has gotten involved or the victim has been removed from the situation of exploitation for a period. Some police express concern about the reliability of victims, especially if they have a drug addiction or have immigrated illegally (Farrell et al. 2014). As a result, not only are victims already resistant to cooperating, but police attitudes may further hinder this willingness to cooperate.

Even when appropriately supported, victims may not be able to provide credible testimony about their experiences because victims of trauma are often not able to recall facts accurately (Women’s Commission for Refugee Women and Children 2007). Without proper training in interviewing techniques for traumatized victims, police can become frustrated when victims change their testimony and may demand additional interviews to clarify inconsistencies. Unfortunately, retelling one’s story to the police in successive interviews can cause additional trauma, consecutively damaging one’s ability to think analytically (Sadruddin et al. 2005). Human trafficking victims often have other problems that make the information they provide less credible. Such compounding issues can include a history of substance abuse, long-term engagement in prostitution, or illegal immigration. Because of these challenges, law enforcement may be unwilling to prioritize such investigations.

Victim-Centered/Trauma-Informed Approach

The experiences of trafficking victims leave them vulnerable and create additional challenges to investigations. Many victims of trafficking suffer from posttraumatic stress disorder (PTSD), depression, and anxiety as a result of their victimization (Hossain et al. 2010; Zimmerman et al. 2008). To properly interview these vulnerable individuals, police need to use trauma-informed and victim-centered techniques. However, most police lack training on such techniques which “negatively affects their ability to interview potential victims or infiltrate organized criminal
networks involved in labor and sex trafficking” (Farrell et al. 2014). Although victim advocates can assist in finding services and shelter for victims during investigations, most police agencies do not have victim advocates and also do not collaborate with outside services providers (Farrell et al. 2014; Farrell and Pfeffer 2014). As a result, some victims return to their traffickers or disappear from services which impedes investigations and creates challenges when it comes to time for prosecution. Feeling as though they only have one tool to increase victim cooperation and decrease risk to victims, police sometimes arrest victims to keep them safe or secure their testimony. While this practice may solve an immediate problem, detention creates greater harms for victims in the long run and breeds deeper distrust of law enforcement. To avoid this, many states in the United States have recently enacted “Safe Harbor” laws that focus on decriminalizing juvenile prostitution so victims cannot be prosecuted and providing services and specialized programs to juvenile victims (Geist 2012). Elsewhere, around the world, countries have adopted laws that make it illegal to buy sex but decriminalize the selling of sex. The decriminalization law adopted by Sweden in 1999 has been applauded by many anti-trafficking activists, and similar laws have been passed in Canada (2014), Northern Ireland (2015), France (2016), and Ireland (2017). These laws divert police attention toward the apprehension of sex trafficking facilitators and buyers.

Despite efforts to protect victims, service providers remain reluctant to notify police of known victims out of fear that the police will only bring further trauma and harm to these individuals (Caliber Associates 2007; Women’s Commission for Refugee Women and Children 2007). This is particularly true for undocumented victims or victims perceived to be irregular migrants. Unless victims are willing to cooperate with the police and/or provide legal officials with information about the perpetrator who harmed them and their experiences as victims, they face risk of deportation. It is difficult for law enforcement to build successful human trafficking investigations when victim is deported because of the loss of key victim-witness testimony.

**Challenges to Prosecution**

As with identification and investigation, the criminal justice system faces significant challenges in prosecuting trafficking in persons crimes and holding traffickers accountable. Globally the number of individuals prosecuted for human trafficking crimes is low. Only 14% \((n = 19)\) of the countries reporting data in the 2012–2014 study period reported prosecuting more than 100 human trafficking cases, and only 11% \((n = 15)\) reported prosecuting between 51 and 100 cases (UNODC 2016). One fourth of the countries \((n = 34)\) reported no prosecutions, or no data were available. Human trafficking convictions were even rarer. In this same period, 15% of countries \((n = 20)\) reported convicting 50 or more offenders in a single year during the 2012–2014 period (UNODC 2016) and 30% of countries \((n = 40)\) reported fewer than 10 convictions or no data on convictions were available. The UNODC report suggests a strong connection between the length of time a country has had
anti-trafficking legislation and the number of successful prosecutions in that country. The countries that were the earliest to criminalize human trafficking through national law had the highest numbers of both prosecuted and successfully convicted cases (UNODC 2016). It is quite likely that there is a relationship between the magnitude of the real (or perceived) human trafficking problem in a country and the readiness of that country to criminalize and respond to the problem. In these cases, countries with more trafficking problems were the first to reform law and correspondingly have the most cases to prosecute. However, the pattern of human trafficking prosecutions across the globe suggests that countries who first criminalized trafficking offenses likely committed resources to support anti-trafficking responses and over time have acquired the expertise to investigate cases that can successfully be prosecuted. Research on prosecution of human trafficking lags behind examination of other aspects of the criminal justice system response, but the discussion below highlights challenges that have been identified as impeding the prosecutorial efforts to hold human trafficking offenders accountable.

**Uncertainty About the Evidence Necessary to Prove a Case**

It is not surprising that prosecutors are cautious in charging human trafficking offenders with trafficking in person-related crimes. Research on prosecutorial decision-making has long suggested that prosecutors make charging decisions based on the likelihood of conviction (Albonetti 1987; Frohmann 1997). A prosecutors’ assessments of whether cases are likely to result in a conviction are primarily based on legally relevant factors, such as the strength of the evidence against the accused, though some studies suggest that the characteristics of the suspects and victims, particularly the nature of the relationship between the two, influence prosecutorial charging decisions (Beichner and Spohn 2012; Spears and Spohn 1997). Research on human trafficking prosecutions in the United States finds that state prosecutors infrequently utilize human trafficking charges, even in cases where defendants are known to be engaged in human trafficking activities (Farrell et al. 2016). Prosecutors interviewed for this study were often the first in their state to prosecute a human trafficking case using state anti-trafficking laws. They expressed concern about charging trafficking offenders on charges that had not been well litigated and where evidentiary standards were not well established. Additionally, prosecutors expressed concern about how to best secure evidence that proved the intent of the defendant was to exploit victims in commercial sex or labor without relying on the testimony of traumatized victims. These prosecutors were often operating on their own with little sources of legal guidance or expertise in human trafficking prosecutions. In the United States, the National Association of Attorneys General recently constituted a committee on human trafficking prosecutions. This professional organization has developed educational material aimed at enhancing state prosecutor knowledge of human trafficking laws and the challenges of developing human trafficking cases (NAAG n.d.).
Reliance on Victim Witnesses

The ability of victims to testify before a grand jury or at trial about the nature of their victimization is essential to prosecuting a case of human trafficking. Although prosecutors may gather physical or digital evidence that corroborates elements of the trafficking crime, a victim or multiple victims are often required to prove the elements of force, fraud, or coercion of the victim. As a result, trafficking victims are often the primary witnesses, and, in some cases, their testimony provides the most compelling evidence against the trafficker. Despite the importance of victim witnesses in human trafficking cases, victims are often reluctance to participate in the criminal justice process (Andrevski et al. 2013; Farrell et al. 2014). Victims of human trafficking suffer from a number of trauma-related conditions that require significant support from victim service providers including health and mental health services (Aron et al. 2006).

Creating trust with victims is often paramount to a successful prosecution. In the United States, victim-witness coordinators are deployed by prosecutors to help build rapport and trust with victims. Victim-witness coordinators also refer victims to services and sometimes even send them to programs in other states that specifically serve victims of human trafficking. In many countries, housing is a primary need of sex and labor trafficking victims. This need includes access to both emergency shelter and long-term housing that will keep victims safe from retaliation by their traffickers. Traditional housing strategies for victims such as domestic violence shelters or group homes for juveniles are often insufficient to meet the needs of human trafficking victims.

Institutional Infrastructure to Support Prosecution

Designation of specialized prosecutors who manage anti-trafficking cases, train local law enforcement officials, and oversee proactive investigations is essential to ensuring that human trafficking laws are enforced and prosecutions are successful. Specialized human trafficking prosecutors have been designated in some countries to develop human trafficking cases and oversee and coordinate human trafficking investigations. As one example, the National Prosecuting Authority in South Africa has assigned prosecutors to oversee, lead, and train provincial anti-trafficking taskforces (US Department of State 2017).

Specialized prosecutors are critical because they understand the nature of human trafficking crimes and particularly the needs of human trafficking victims. While an inexperienced prosecutor would see a reluctant and potential unreliable victim as impeding prosecution, a specially trained prosecutor would understand and expect that a victim may initially lie to police about the facts of the case due to a trafficker who succeeded in controlling the individual so that he or she does not trust law enforcement (US Department of State 2017). The specialized prosecutor would be able to connect victims to service providers and others who may be more successful in stabilizing a victim and preparing them to have future conversations with prosecutors to assist in the building of a criminal case.
Conclusion

Although the criminal justice system has been activated in many countries to respond to crimes of trafficking in persons, the number of arrests and particularly prosecutions remains low. There are a number of institutional factors that impede criminal justice agents from successfully identifying, investigating, and prosecuting human trafficking cases. In particular, police must develop capacity to identify a broad range of human trafficking crimes in their local community. This includes partnering with agencies locally to develop intelligence on areas of risk, including labor inspectors and regulatory agencies and nongovernmental organizations that have access to populations at greatest risk.

Prosecutorial authorities must guide local trafficking in persons investigations to ensure that the investigations conducted by law enforcement partners support successful prosecutions. Trafficking cases require local officials to gather evidence to corroborate victim testimony. This is often a time-consuming and laborious process requiring that law enforcement officials are trained on the correct ways to gather evidence to prove that a defendant intended to exploit a person through commercial sex or labor. Guiding such investigations requires understanding and responding to the complexity of human trafficking cases and developing proactive investigations that secure evidence beyond victim testimony. Without such leadership, human trafficking investigations will be poorly prepared and lead to unsuccessful prosecutions that ultimately fail to protect those victims who seek justice.

Abstract

The complexity of the crime human trafficking requires coordinated action across borders and in every sector of society to end it. However, effective collaboration is difficult. Several forms of multisector collaboration occurring around the world are discussed, and four collaboration-catalyzing initiatives of the US government are summarized. Leveraging insights from interorganizational relations and the sociology of organizing, three key challenges in multisector collaboration against human trafficking are identified: (a) differences in the power, status, and financial resources of the organizations attempting to collaborate; (b) tensions between differing, sector-based values and priorities; and (c) power dynamics stemming from the majority/minority gender and ethnic/racial patterns that vary by sector in

**Introduction**

Since well before the United Nations’ 2000 adoption of the Palermo Protocol to Prevent, Suppress, and Punish Trafficking in Persons, people working in a variety of sectors in many countries have been striving to stop the trafficking of persons and help those who have been trafficked. It is widely agreed that collaboration is necessary between organizations in the public, private, and civil society sectors due to the scope and complexity of the crime and the multiple forms of harm caused to victims (Cockayne 2015; Foot 2016; van der Watt and van der Westhuizen 2017). Organizations in all of these sectors are actively engaged in counter-trafficking efforts in many countries, although there are differences across national contexts due to political, economic, and cultural factors. However, collaboration is a complex interaction between human agency, interpersonal dynamics, and the wider social, political, and economic contexts in which it takes place. In view of the power structures and dynamics in these contexts, cross-sector engagement, much less multisector collaboration, is not always possible – neither can it be assumed to be inherently beneficial to the parties involved or the intended beneficiaries of their efforts.

Since 2000, there has been a marked increase in actions by governments and nongovernmental organizations (NGOs) around the world intended to end human trafficking and to serve those who have been harmed by it (Foot et al. 2015). Many attempts at collaborative partnerships on human trafficking emerge organically, typically through the professional contacts and initiative of organizational leaders. However, not all partnerships are initiated and structured by their member organizations. Some partnerships begin through the stipulations of funders. For example, in the USA, some government agencies and several private foundations have made structured collaborations a requirement for grant funding and have designated funds to support the coordination of multisector partnerships.

There are many survivors of human trafficking working alongside those who have never been enslaved in anti-trafficking efforts. Some publicly identify themselves as survivors, while others choose not to do so. Some work in what they term “survivor-led organizations”; others work independently or in other types of organizations. Some survivor-leaders in anti-trafficking efforts choose not to publicly disclose that information.
Origins and Forms of Multisector Collaborations Against Human Trafficking

The earliest efforts at large-scale collaboration were led by International Labour Organization (ILO), founded in 1919 and organized as a UN agency in 1946. The ILO continues to lead multisector efforts against all forms of labor exploitation around the world, including those associated with human trafficking, by engaging governments, employers, and workers across industries and in all regions of the world.

Individual leaders of counter-trafficking efforts from within the private, academic, and civil society sectors have founded several counter-trafficking initiatives focused on influencing and enrolling businesses – often by creating nonprofit umbrella organizations. Examples of these include the Coalition of Immokalee Workers founded in 1993; GoodWeave International, founded in 1994 as RugMark; Truckers Against Trafficking, founded in 2009; Shift founded in 2011; and Businesses Ending Slavery and Trafficking and the Global Business Coalition Against Trafficking, both founded in 2012. Each of these organizations is doing groundbreaking and exemplary work to prevent and end human trafficking in and by businesses, but only the latter two have corporations as members per se. Since human trafficking occurs within businesses and their supply chains, direct participation in – and collaborative leadership by – businesses is essential to the success of counter-trafficking efforts both within the private sector and between the private sector and other sectors.

In some countries, government agencies have initiated multisector task forces into which some municipal, county, and state government agencies, individual businesses, industry associations, and/or NGOs are invited to participate. In the USA, the Enhanced Collaborative Model task force grants awarded jointly by the Bureau of Justice Affairs and the Office for Victims of Crime to municipal or intrastate regional “multidisciplinary” task forces with “core teams” of enforcement agencies and NGO providers of victim services have catalyzed cross-sector collaboration. These task forces are discussed in greater detail below.

It appears that in many, perhaps most, countries, efforts to coordinate counter-trafficking actions are primarily taking place through alliances or coalitions initiated and constituted mainly by NGOs. One likely factor is that membership in multi-NGO coalitions and multisector coalitions is actively encouraged across the aid industry, including in the counter-human trafficking realm (Davy 2013a). NGO leaders around the world involved in counter-human trafficking efforts have articulated strong desire for governments and businesses to partner with them in preventing and ending human trafficking. They express hopes that collaborative engagement with government agencies and businesses would result in greater awareness of the crime and the plights of victims; greater stability, legitimacy, and safety for their NGOs; increased funding for counter-trafficking efforts; and enhanced effectiveness. Such hopes are consistent with findings from other studies.
regarding the value of cross-sector partnerships (Koschmann et al. 2012). However, extant scholarship on NGO networks addressing other issues in some countries indicates that these hopes are fraught with fears that engaging with – and particularly accepting funding from – businesses or government agencies risks the independence, credibility, and/or moral position of NGOs (Alidu and Asare 2014; Ashman 2015).

**US Government Efforts to Initiate and Sustain Domestic Multisector Collaboration Against Human Trafficking**

The US government has arguably done more than any other national government to catalyze interagency coordination and multisector collaboration. Since the early 2000s – during the G.W. Bush, Obama, and Trump administrations – it has invested significantly in training and funding what it terms “multidisciplinary task forces” to counter human trafficking. To further underscore the necessity of collaboration, in 2009, the US Department of State added “Partnership” to the “3P” framework of prevention, prosecution, and protection employed by itself and many governments. The stated rationale for that addition was that partnership catalyzes progress on the other “Ps.” Subsequently, the 2010 *Trafficking in Persons Report*, issued annually by the US State Department since 2000, included partnership as the fourth “P” for the first time and articulated an expansive conceptualization of multiple forms of partnership, including:

> Combating human trafficking requires the expertise, resources, and efforts of many individuals and entities. It is a complex, multi-faceted issue requiring a comprehensive response of government and nongovernment entities in such areas as human rights, labor and employment, health and services, and law enforcement. It requires partnerships among all these entities to have a positive impact.

Partnerships augment efforts by bringing together diverse experience, amplifying messages, and leveraging resources, thereby accomplishing more together than any one entity or sector would be able to alone. Examples of existing partnerships governments use to facilitate prevention, protection, and prosecution include:

- Task forces among law enforcement agencies that cooperate to share intelligence, work across jurisdictions, and coordinate across borders
- Alliances between governments and business associations that seek to craft protocols and establish compliance mechanisms for slavery-free supply chains
- Regional partnerships among nations, such as the anti-human trafficking efforts of the Organization of American States (OAS) or the European Union (EU). (US Department of State 2010).

Yvonne Zimmerman (2013) notes the expanded range of entities and sectors named as important partners in anti-trafficking efforts and contends that the addition of the term partnership “into core elements that structure and guide the United States’
anti-trafficking policy . . . confirms the more collaborative diplomatic posture of the United States’ anti-trafficking stance” during the Obama administration.

Under the mandate of the US Trafficking Victims Protection Act (TVPA), passed originally in 2000, multiple federal agencies have funded and facilitated collaboration against human trafficking in many ways. Four significant efforts are summarized here. First, the TVPA’s creation of the President’s Interagency Task Force to Monitor and Combat Trafficking in Persons (PITF), a cabinet-level entity chaired by the Secretary of State, proved foundational in coordinating the efforts of federal agencies against human trafficking.

Second, the TVPA stipulated the allocation of federal funds to offer multi-year, renewable grants to qualified governmental and nongovernmental entities to support coordinated counter-trafficking efforts and services for victims – an effort begun in 2004 by the US Department of Justice (DOJ) through its Office of Justice Programs, Bureau of Justice Assistance (BJA), and Office for Victims of Crime (OVC). Initially, the BJA grants supported multiagency law enforcement anti-trafficking task forces in selected cities across the country. Correspondingly, between 2003 and 2009, the OVC offered grant funds to qualified victim service provider organizations in some cities that had a multiagency law enforcement task force. The purpose of the OVC funds during those years was to provide services to foreign nationals whom service providers believed to be victims of trafficking. Beginning in 2010, BJA and OVC began to jointly fund grants via an Enhanced Collaborative Model of “multidisciplinary” task forces across the country, which included support for victim service agencies and law enforcement agencies to take a comprehensive approach to investigating all trafficking crimes and providing services to trafficking victims regardless of citizenship or age. Proposals for “Enhanced Collaborative Model to Combat Human Trafficking” grants must be developed collaboratively between at least one law enforcement agency (LE) and one victim service provider organization (VSP). Grantees are also expected to work collaboratively with the local US Attorney’s Office. At the peak of this grant program, task forces in 42 US cities received DOJ funding (Foot 2016).

Third, the US government’s significant investment in collaboration was evidenced in its landmark 5-year federal “Strategic Action Plan” (SAP) on services for people trafficked in the USA (US government 2014). The development of the 80-page plan itself required major collaboration between the 3 entities that co-chaired the plan development process (the Departments of Justice, Health and Human Services, and Homeland Security) and the 17 other federal agencies which contributed to it. In addition, input from other stakeholders including nongovernmental organizations and trafficking survivors was elicited at several points during the development process, and public comments on the draft plan were invited during a 45-day period in mid-2013. The plan ambitiously details many ways that federal agencies will partner with stakeholders in a diverse array of sectors in the future.

A fourth significant initiative by the US government to catalyze collaboration in counter-trafficking efforts was the development and publication of a “Human Trafficking Task Force e-Guide” by the DOJ’s Office for Victims of Crime Training and Technical Assistance Center. Published online originally in 2011 and updated in
2014, the e-Guide was coproduced by the BJA and the OVC with input from law enforcement and victim service providers. The updated e-Guide acknowledged a wide array of organizations from diverse sectors that could be sources of referrals and support for law enforcement and service providers:

Increased public awareness of the existence of human trafficking within communities often generates the interest and the benevolence of nontraditional supporters of law enforcement and service provider partnerships. Members can increase human trafficking case referrals from, and improve public awareness within, local faith-based groups, homelessness organizations, migrant farm worker groups, pro bono and immigration attorneys, sexual assault and domestic violence advocates, civic and cultural groups, restaurant and hotel employees, school and medical officials, as well as regulatory inspectors, routine patrol officers, truck drivers, and utility workers, among others. By providing outreach specifically tailored to the needs and circumstances of each group, the stakeholders learn how to contact the task force for help. (US Office for Victims of Crime Training and Technical Assistance Center 2014)

Elsewhere in the e-Guide, a more detailed list is of potential partners that include victim impact/survivor consultants, academics with expertise on human trafficking, low-wage workers’ rights groups, sex workers’ rights groups, and immigrant advocacy groups, along with others. Despite the anti-trafficking efforts of some businesses and industry associations, the private sector was largely – and notably – missing from this list of potential partners.

The e-Guide acknowledges “common cultural gaps” between sectors engaged in counter-trafficking efforts and some reluctance to share information between investigators and prosecutors and between federal and local authorities. It also acknowledges historically patterned forms of competition between different law enforcement agencies, between state and federal agencies, and between service provider organizations. It identifies each of these sectors as suffering from intra-sector, anti-collaborative dynamics which must be overcome. Long-standing tensions between the law enforcement and victim service sectors are also acknowledged; these are characterized as impeding collaboration. In naming these internal and cross-sector tensions, the e-Guide is remarkably forthright. Its recommendations regarding task force leadership and strategies for managing conflicts between law enforcement and victims service providers are well-grounded in the experiences of task forces from across the USA. However, the utility of the e-Guide’s recommendations for handling the challenges of multisector collaboration is limited not only by its primary focus on the law enforcement and victim service sectors but also by the absence of attention to an array of other systemic tensions in multisector anti-trafficking efforts – which are the focus of the next section.

Challenges in Multisector Collaboration to Counter Human Trafficking

Many multisector collaborations have failed or dissolved before accomplishing their aims, and every such effort faces significant challenges that are largely systemic in nature. Descriptions of such challenges have been included in published analyses of
counter-trafficking collaboration efforts in Europe (Konrad 2008; Limanowska and Konrad 2009), Southeast Asia (Algeri 2012; Davy 2013b), and the USA (Foot 2016; Jones and Lutze 2016). Common types of challenges in counter-trafficking collaboration efforts stem from (a) differences in the power, status, and financial resources of the organizations attempting to collaborate; (b) tensions between differing, sector-based values and priorities; and (c) power dynamics stemming from the majority/minority gender and ethnic/racial patterns that vary by sector in some countries. Each of these is discussed below.

**Differences in Power, Status, and Financial Resources**

Within every sector and between sectors, funding increases status, and status increases influence. So multisector partnerships against human trafficking are shaped by power based on money, as well as forms of power that are based on other organizational or sector characteristics, such as legal mandates and constraints, and governance norms, protocols, and regulations. Perceived or actual differences in these characteristics of each organization and sector influence how they function in interactions with others regarding trafficking in persons. For example, NGO-led counter-trafficking coalitions have been found to face challenges in their interactions with government agencies and businesses in part due to typically weaker position politically and less-stable funding vis-à-vis organizations in the public and private sectors (Foot et al. 2018). Such coalitions vary in their cross-sector interaction aims and the membership and partnership structures they have developed in relation to public and private sector entities. The engagement strategies employed by the leadership of NGO coalitions in relation to government agencies and businesses vary, but many NGO leaders articulate a desire for substantive interaction about efforts to counter trafficking in persons with leaders in government and businesses. In their perception, that desire is not reciprocal because NGOs have less status and fewer resources than government agencies and businesses.

**Tensions Due to Differing Values, Beliefs, and Priorities**

Beliefs, values, and priorities are held and enacted by both individuals and collectives in every line of work. They are often unconscious, often shaped by a person’s or an organization’s history and culture. Beliefs can be understood as ideas about what is good and real and how the world works. Values are ideals about what matters. Collectively held values can be powerful forces in multisector interactions: when actors align on them, they coalesce more easily; when they do not, collaboration may be more turbulent.

Tensions arising from differing values, beliefs, and priorities exist within and between every sector. Both the foundational beliefs and guiding values of organizational leaders shape the aims, priorities, and cultures of organizations and therefore also shape how organizational representatives interact with each other. It could be said that the more bureaucratic the organization, the less influence wielded by
individual leaders’ beliefs and values. Nonetheless, when leaders in any organization establish focal priorities for a team or shape a group’s approach, their personal values and beliefs are inextricably intertwined with organizational and broader professional or sector-based values and beliefs – and these carry over into interorganizational, cross-sector interactions.

Huxham and Vangen (2005) explain that three corresponding sets of aims play into and are produced through multilevel conversations in interorganizational relations: collaborative aims (shared between partnering organizations), organizational aims, and individual aims. Collaborative aims pertain to what organizations aspire to achieve together and how they will work together. In the context of interorganizational collaboration, organizational aims are what each partnering organization hopes to gain for itself from participating in the collaboration. Individual aims reflect the aspirations of the participating individuals and typically relate to career progression or what Huxham and Vangen call “personal causes,” which are likely to stem from personal beliefs and values. Moreover, an individual’s values, beliefs, and priorities may influence his or her choice to work within a particular organization, profession, and sector. It is also the case that as individuals are schooled, trained, and socialized into an organization, profession, and sector, the historically patterned values, beliefs, and priorities of the collective entities influence the individuals within them.

The dynamics of differing individual and collective ideas about what is real and true – and ideals about what matters – course through interactions between representatives of anti-trafficking organizations and agencies. This creates challenges in collaboration. A common manifestation of misalignment between values is evident between the law enforcement and victim service provider sectors. A common manifestation of differing beliefs is evident between faith-based and areligious organizations. The following brief discussion of each example draws out their implications for multisector collaboration.

Example: Conflicting Sector-Based Concepts of a Victim-Centered Approach to Human Trafficking

In the law enforcement sector, the strong presence of sector-wide values of individual (and agency) autonomy and achievement and the pursuit of justice – combined with a lack of understanding of the predominant values of victim service provider sector and the absence of regard for collaboration – create barriers to cross-sector collaboration with victim service providers (Foot 2016; Vanek 2015). More specifically, the differences between these sectors in their concepts of a “victim-centered approach” to human trafficking evidence how differences in values and beliefs create tensions in collaborations between them. Since at least the mid-2000s, the US Departments of Justice, State, Health and Human Services, and Homeland Security have used the term “victim-centered” to characterize their ideal approach to human trafficking. State and local governments have adopted the term, as have many NGOs. Hundreds of webpages, pamphlets, and personnel-training media produced by law enforcement and victim service providers employ the “victim-centered” phrase.
Even though both sectors use the term “victim-centered,” because of differences in some of each sector’s core values, they conceptualize it differently and emphasize different aspects of it. The core values of the law enforcement sector center on truth and justice, manifested in both the safety of the victims and the successful prosecution of the trafficker. In contrast, the core values of the victim service provider sector center on confidentiality and victim empowerment.

To elaborate, LE conceptualizes victim-centeredness as an approach that values “identifying and stabilizing victims” and on “investigating and prosecuting traffickers” equally, with inherent tensions between these values. NGO-based victim service providers, in addition to using the term “victim-centered,” also typically describe their work as “client-directed” or “client-driven” and prioritize a victim’s wishes, safety, and well-being over the pursuit of justice. Because they value the choices of a victim/client above all else, victim service providers tend to not experience the dilemma of law enforcement between conflicting values of supporting victims and bringing traffickers to justice.

Example: Tensions Between Faith-Based and Areligious Organizations

Tensions abound between faith-based organizations (FBOs) and areligious organizations engaged in counter-trafficking efforts (Foot 2016; Zimmerman 2013). Many of these tensions stem from differences in beliefs and/or values. Although FBOs are by no means homogenous in their beliefs or in the values that shape their efforts, they tend to articulate organizational values, priorities, and sometimes specific activities and programs in relation to their religious beliefs, thereby demonstrating that those beliefs hold strong value for them. In contrast, areligious organizations tend to characterize their organizational values, priorities, and sometimes even their activities and programs, in relation to beliefs or principles regarding human rights – specifically, that human rights are good and real and how the world works, or at least how it should work. For many areligious organizations, beliefs about human rights hold strong value for them. Although religious beliefs and human rights beliefs are by no means mutually exclusive, they do provide two different points of orientation. Such differences in belief and values shape collaboration dynamics. The consequences of the tensions that stem from differences in beliefs and values may be that mutual distrust is growing right when and where it needs to recede in order to foster the larger-scale, longer-term structural changes necessary to eradicate slavery.

Gender and Race

The dynamics of race and gender are generally overlooked in analyses of multisector collaboration, but they influence the way many collaborations function, and they do so in anti-trafficking efforts (Foot 2016). A seminal study by Jon Miller and co-authors demonstrated stratification by race and gender among members in six multiagency “systems” for social service provision (Miller et al. 1981). Every individual involved in interorganizational collaboration experiences that process through interactions with particular, embodied others. When organizations collaborate, it is these people who
work together in ways that integrate the individual, group, organizational, and sector levels in which their work is situated. So the characteristics and sense of identity carried by individuals are consequential to multisector interactions. Although markers of professional and class distinctions are not always apparent, race and gender demographics are generally more obvious, and they elicit a range of subconscious as well as conscious responses that affect multisector collaborations. Patterns in gender and racial dynamics become ingrained over time in organizations, professions, and sectors.

When representatives of sectors that have large and differing gender and/or racial/ethnic majorities interact, tensions are likely to arise. This is because the internal sense that all people have about what their gender and race means to them, and what others’ genders and races mean for them, is culturally shaped and deeply rooted in individual and (semi-)collective psyches. Consciously and subconsciously, everyone carries culturally and historically shaped ideas, norms, and expectations of race and gender into multisector collaboration, that is, into interactions as organizational representatives with representatives from other organizations. For example, there are differences between individuals’ ideas about what it means to be men or women and about what is “normal” or “appropriate” or “good” behavior for men and women in various contexts. When such differences surface during collaboration attempts, they can cause short-term or long-lasting breakdowns in a partnership.

This is especially apparent when the professional roles themselves are traditionally gendered. The term “gendered organization” was coined by Joan Acker to refer to the underlying logic and dynamics of organizations that have historically been populated primarily by one gender (Acker 1990). The concept of gendered organizations has been extended to networks and professions as well (Williams et al. 2012). For example, in the USA, a large majority of licensed social workers are female and white, and a large majority of law enforcement agents are male and white. In contrast, federal analyses of cases of trafficking in the USA show that across all forms of trafficking, victims who have been identified by law enforcement agencies or victim service providers are disproportionately non-Caucasian and female. So law enforcement can be understood as a male-gendered profession, and social services can be understood as a female-gendered profession.

It is not unusual for female victim service providers to describe feelings of being subordinated by the law enforcement representatives with whom they are expected to collaborate – and not solely because of the authority held by the law enforcement sector. The law enforcement sector as a whole operates within a paramilitary structure with a hierarchy of ranks and protocols. The structure of the sector has been widely critiqued as patriarchal, that is, as a system where men hold greater power and where male-oriented norms are considered the most acceptable. That does not mean that everyone who works in law enforcement personally supports patriarchy. But it is not surprising that some victim service providers express a sense of chagrin about the gendered assumptions they think some male law enforcement representatives hold.
Just as there are particular patterns of interaction within and between gendered organizations and professions, there are also patterns of race-based interaction in and between organizations and professions in which a large majority of members share a common ethnicity. People from the minority race or ethnicity as well as from the minority gender face an array of challenges when trying to collaborate with those in the majority.

When people feel they are being subordinated, they do not see themselves as partners building or sharing a mutual identity. They do what they must, but they are neither willing nor able to invest in the collaboration beyond what is required; instead, they look for ways to minimize interacting with those from the other organization or sector who evoke fears for them. The partnership may continue, particularly if it is mandated by funders or other external requirements, but it will not become robust or generative. Such dynamics, when unaddressed, can doom a promising collaboration. Collaborations that avoid gender- and race-based power imbalances are likely to be more generative.

**Promising Practices**

Fundamentally, the tension between the tendency toward mutual suspicion and the need to build trust is a systemic paradox in many multisector collaborations. Such tensions can provoke reflection among leaders of anti-trafficking efforts in every sector on their own organization’s biases about and contributions to collaboration opportunities. This reflection can also lead to particular practices for leading, communicating, and organizing that can catalyze collaboration-building despite the inevitable challenges.

Communication and mediation skills are essential for negotiating functional partnerships despite differences in the core values by which each sector operates. Promising practices of multisector collaboration include the following:

1. Acknowledging perceived power differentials, whether due to differences in political economic positions or in the demographics of the people who represent a sector in a particular setting, and agreeing explicitly on how these will be mitigated in collaborative work.
2. Openly discussing ways that leadership structures and communication processes can be democratized in multisector coalitions.
3. Collectively reflecting on the variety of motives and values that bring actors into counter-trafficking efforts, shape their aims, and influence how they work.
4. Developing shared norms for multisector interactions. Such practices can be employed in starting, repairing, sustaining, and enhancing counter-trafficking collaborations.

These collaboration practices require investments of time and resources to plan and to implement plans consistently from the beginning of a multisector coalition.
Such practices become more costly when attempts at collaboration break down. Sustaining a carefully designed and well-led coalition is easier than mending one that has seized up or fallen apart. It is no simple matter to overcome disillusionment over failed collaborations, to reshape counterproductive patterns such as retreating into intra-sector interactions, or to expand functional alliances that were built around “like-minded” organizations across sectors but end up becoming exclusionary.

Collaborating only with same-sector organizations or sectors that share key characteristics is undeniably easier, but it has two major drawbacks. First, in many instances, it simply will not solve the problem at hand. Second, much is gained by working with people who offer different perspectives. So in addition to the overarching reality that human trafficking will not end without large-scale systemic changes which require everyone’s best efforts, the more immediate reason to strive to diversify collaborations against trafficking is that the range of potential solutions will be limited without the perspectives that are underrepresented.

Once a decision has been made to build a diverse collaboration, or to diversify an existing one, it is vital that existing partners think broadly together about their collective strengths and limitations and about the kinds of perspectives, ideas, and expertise that would enrich the collaboration. There must be some kind of value offered to the invitee(s) to motivate them to accept. Further, any invitee considering joining an existing collaboration in which the prior partners have a lot in common, or even just one or two very important things in common, will want to hear what is expected and assess the extent to which leadership (and responsibilities) will be shared. Few people are willing to be a “token,” platformed but not empowered, as, say, the only survivor-activist on a conference planning committee, the one woman on a law enforcement task force, or the sole person of color on an all-white leadership council. It is particularly important to note that survivor-leaders have expressed the need for greater cooperation between survivors and non-survivors and for more survivors to be included in leadership of anti-trafficking efforts that have not been initiated by survivors.

Conclusion

It is well-established that the kinds of societal changes that are necessary to counter problems like human trafficking require the engagement of leaders from every part of society, every sector. A growing array of organizations dedicated to fostering multisector collaboration on complex societal problems are gaining audiences among leaders in business, government, and civil society. Examples include the Intersector Project, FSG Consulting, and the Collective Impact Forum.

Abstract

Drawing on a comprehensive review of the international literature, this chapter will examine health and social service-based human trafficking response models, with focus on those developed in the industrialized countries. It will discuss the four main building blocks of a service-based response model; will highlight key elements to successful service delivery, as well as the primary challenges and barriers associated with service provision to trafficked persons; and will offer suggestions for ongoing and future initiatives.

Introduction

The awareness of human trafficking has been building for several decades. Special laws, policies, strategies, and initiatives have been implemented worldwide to combat the problem, and many lessons have been learned in the process. Arguably the most important outcome of this learning was the recognition that trafficking in persons (TIP) is an extremely complex phenomenon, which cannot be addressed by a single organization or institution (US Department of State 2011, 2018). As a result, a plethora of multipronged human trafficking response models emerged around the globe.

Also known as “referral mechanisms,” human trafficking response models can be described as cooperative frameworks through which various stakeholders, including government agencies, health and social services, criminal justice system, and community members, coordinate efforts in a strategic partnership designed to assist and protect trafficked persons (Organization for Security and Co-operation in Europe/Office for Democratic Institutions and Human Rights [OSCE/ODIHR] 2004). These models are quite diverse in terms of their geographic scope, legal and conceptual frameworks, structures, governance schemes, and funding sources. Some response models address all forms of human trafficking (see Table 1), while others focus on a particular category, most commonly sex trafficking, e.g., model developed in York Region, Ontario, Canada (Timoshkina 2013). Some may have an even more specific emphasis, such as combating sexual exploitation of children and youth – for instance, models developed by the Province of Manitoba, Canada (Tracia’s Trust 2008), and the states of Georgia and Minnesota in the USA (Georgia Governor’s Office for Children and Families 2009; Schauben et al. 2017). Some models have been built from the grassroots, in response to the recognized needs of the local communities, e.g., the London and Ontario model; others have been initiated from the top, by government agencies, e.g., the UK model (see Table 1). Most response models bring together both secular and religious organizations, but some are expressly faith-based, e.g., international models under the auspices of the Coalition of Catholic Organizations Against Human Trafficking (n.d.), Faith Alliance Against Slavery and Trafficking (2018), Christian Action and Networking Against Trafficking in Women, and The Salvation Army Initiative Against Sexual Trafficking (Elliott 2005).

Informed by the “4Ps” (prevention, protection, prosecution, partnerships) paradigm (US Department of State 2011), human trafficking response models comprise a broad spectrum of activities, including, but not limited to, advocacy, research, awareness-raising campaigns, the apprehension and prosecution of traffickers, and the provision of health and social services to trafficked persons. The focus of this chapter is on the service-based models. The author’s goal is to offer a useful, practical resource for current and future service providers, especially in the areas where human trafficking responses are yet to be developed or are in need of refinement.

The Building Blocks of a Service-Based Human Trafficking Response Model

This section examines four main building blocks of a health and social service-based human trafficking response model that were identified through the review of relevant international literature: (1) coordinating body, (2) set of guiding principles and values, (3) victim identification procedure, and (4) referral and assistance protocol for streamlined service delivery. Recommendations for ongoing and future initiatives are provided throughout the text.

Coordinating Body

Literature addressing the development of service-based human trafficking response models (Davy 2015; Gerassi et al. 2017; Home Office 2014; Kim et al. 2018; Laboratory to Combat Human Trafficking [LCHT] 2013; Muraya and Fry 2016; Perdue et al. 2012; Ricard-Guay and Hanley 2014; Timoshkina 2013; Timoshkina et al. 2015; US Department of State 2018; Vijendran 2017) paints the following picture. The model-building process typically starts with the coming together of several organizations and individuals concerned about the problem of TIP in their community and beyond. Key stakeholders usually include law enforcement, nonprofit social service organizations, health-care providers, faith-based groups, government agencies, educational institutions, researchers, and community activists. An antihuman trafficking coalition, network, committee, or task force is then formed. Members of this new entity meet regularly to discuss an action plan. The membership and meeting attendance may fluctuate, but a dedicated core group soon emerges, and one of the member organizations assumes leadership role, sometimes via official government designation. This role may be taken on by a women’s shelter, a rape crisis/sexual assault center, a faith-based organization, law enforcement, victim services, child and family services, an agency working with immigrants and refugees, or a government office. In some instances, two or three organizations may be chosen as co-leaders/co-chairs. The collaborative entity becomes the primary body responsible for coordinating human trafficking responses in a selected catchment area.

It is common for the coordinating body to capitalize on already existing collaborative professional relationships (Kim et al. 2018; Timoshkina 2013). The entity may operate on a purely voluntary basis or establish paid positions upon receiving funding, usually through a government grant (Timoshkina et al. 2015). As the model evolves, the entity may become a stand-alone, incorporated/registered organization.

It is advisable that the coordinating body develop a clear structure to help sustain systematic collaborations and to weather inevitable changes in membership and leadership (International Organization for Migration [IOM] 2015; LCHT 2013; Timoshkina et al. 2015). Having task-specific committees and subcommittees, and a full-time, paid coordinator, who will facilitate networking and timely information
sharing among the stakeholders, is strongly recommended as the enthusiasm of even the most passionate volunteers tends to fade away with time due to the demands of their regular jobs (Davy 2015; Timoshkina et al. 2015). Where possible, the coordinator should personally visit all of the partner organizations to familiarize herself/himself with their workings and to get introduced to the staff.

Stakeholders “should receive training in interagency collaborative best practices to counteract obstacles suggested to jeopardize effective interagency collaboration such as turfism, agency dominance, and ineffective leadership” (Jones and Lutze 2016: 170). In addition, each participating organization should provide ongoing human trafficking awareness and response training to its staff and should consider putting in place formal internal protocols for working with trafficked persons.

Further, it is very important for the coordinating body to develop guiding policies and procedures and to clearly articulate them in written documents, such as a mission statement, terms of reference, bylaws, code of conduct, strategic framework, and/or interagency memoranda of understanding (IOM 2015; LCHT 2013; Timoshkina et al. 2015). For government-driven, large-scale and transnational models, legally binding partnership and collaboration agreements will be a requirement (Home Office 2014; IOM 2007). These documents should address the exact nature and scope of the proposed initiatives, membership criteria, rules and expectations regarding meeting attendance, decision-making process, committee service, members’ roles and responsibilities, each organization’s time, financial, human resources and other contributions, as well as key principles and values that all responders will be required to adhere to (Kim et al. 2018; Ricard-Guay and Hanley 2014).

Adopting the aforementioned measures will help to identify and address deficiencies in service provision, to avoid knowledge gaps and duplication of efforts, and to increase efficiency (Kim et al. 2018; Ricard-Guay and Hanley 2014).

**Guiding Principles and Values**

Service-based responses to human trafficking should be informed by a specific set of humanistic principles and values, which may be presented as an overarching conceptual framework, an underlying philosophy, an ideological platform, as theoretical underpinnings, or as a spiritual mandate. Clearly stating these mutually agreed-upon principles and values is paramount as they will guide all aspects of the collaborative response, affecting how trafficked persons are viewed and treated and subsequently determining survivor outcomes (Timoshkina et al. 2015).

Feminism, anti-racism, anti-oppression, strength-based approach, and “do no harm” are some of the terms commonly found in the documents adopted by responders (IOM 2007; Timoshkina et al. 2015; US Department of State 2018). While the wording may vary, human rights and social justice emerge as the core concepts (Global Alliance Against Traffic in Women [GAATW] 2000; Timoshkina et al. 2015; US Department of State 2018). They encompass such principles as
nonjudgment, inclusivity, informed consent, empowerment, transparency, safety, privacy, and confidentiality (Muraya and Fry 2016; Steiner et al. 2018; Timoshkina et al. 2015). These principles underpin person-centered model of care (see Fig. 1), which ensures the provision of individualized, trauma-informed, culturally competent services to trafficked persons and is recognized internationally as the best practice (Steiner et al. 2018; Timoshkina et al. 2015; US Department of State 2018). In essence, it is about meeting people where they are at, valuing their experiences, respecting their right to self-determination, and helping them to make informed choices and to take back control of their lives (Nsonwu et al. 2018; Ricard-Guay and Hanley 2014; Steiner et al. 2018).

Although virtually all response models appear to endorse principles and values of social justice and human rights, there are significant differences in how these concepts are being understood, articulated, and operationalized, which is manifested in the actual definitions of human trafficking and trafficked persons adopted by responders. As one vivid example, responses to sex trafficking reflect a wide spectrum of opinions regarding the commercial sex trade. Neo-abolitionists view prostitution as a crime and a gross violation of human rights, calling for its ultimate abolition, and neo-abolitionist models may equate all forms of the commercial sex trade with human trafficking and consider all persons involved in the sex industry to be trafficked (Gerassi and Nichols 2018; Soderlund 2005; Timoshkina 2014). Conversely, “sex-positive” responders distinguish between sex trafficking and consensual sex work and argue that the latter should be recognized as legitimate labor and people should have the right to work safely in the sex industry (Gerassi and Nichols 2018; Soderlund 2005). Others occupy the middle ground and contend that many people involved in the sex trade may not be trafficked according to conventional definitions yet should have access to various supports (GAATW 2000; Gerassi
et al. 2017; Ricard-Guay and Hanley 2014). Similar disagreements are apparent in responses to other forms of human trafficking (Cockbain et al. 2018; Ricard-Guay and Hanley 2014). Responders also take different stance on women’s reproductive rights and the rights of sexual minorities, particularly in secular versus faith-based models (Gerassi and Nichols 2018).

The divergent interpretations of humanistic principles and values translate into different approaches to service provision. In some models, responders may favor raid-and-rescue approach and advocate for the persons’ immediate and permanent liberation from trafficking (Ahmed and Seshu 2012; Gerassi et al. 2017; Soderlund 2005). Other models adopt harm reduction approach, with responders providing support to persons who are unable or unwilling to exit trafficking (e.g., due to fear, financial need, or attachment to the traffickers) and assisting survivors who decide to work in the sex industry or informal economy post-trafficking (Gerassi et al. 2017; International Labour Organization [ILO] 2009; Timoshkina et al. 2015). Within the harm reduction model of care, trafficked persons who have become dependent on substances also are not required to be clean and sober to receive services, while services provided through other models may include complete abstinence from drugs and alcohol as an eligibility criterion because responders may believe this to be the most effective approach to recovery from addiction and thus in the survivors’ best interests (LCHT 2013). Faith-based models, often described as restorative (i.e., aimed at restoring persons to wholeness as they have lost part of themselves because of trafficking), may prioritize religious principles and values and may use prayer and participation in religious ceremonies or broader spiritual programming as tools in victim rehabilitation and partnership-building (Perdue et al. 2012). This is not the case in secular models. In some models, whether secular or faith-based, responders may employ controversial tactics, such as negotiating with traffickers and buying victims out (Harrelson 2010).

Response models also differ in their stance on the trafficking survivors’ involvement in the design and delivery of services. Some models actively draw upon insights of the survivors and view their participation in all aspects of response efforts as essential and empowering (Clawson et al. 2009; Timoshkina et al. 2015; US Department of State 2018). Others consider such approach ethically suspect and decide against it out of concern of causing harm by inadvertently over-exposing, re-traumatizing, and re-exploiting survivors and due to apprehension regarding the survivors’ lack of relevant professional skills (Ottawa Coalition to End Human Trafﬁcking 2016; Wachter et al. 2016). Yet others welcome survivor participation in select activities, such as peer mentorship and educational programs, but not in fundraising or direct practice (Ricard-Guay and Hanley 2014; Wachter et al. 2016).

Differences in principles and values espoused by responders may depend on the driving forces behind their models. Community-based models are more likely to be person-centered and to utilize harm reduction approach, while models led by the law enforcement and government agencies have more restrictive mandates and may prioritize the prosecution of traffickers over the protection of the trafficked.
Agreeing on the principles and values that will guide human trafficking response model requires serious conversations and negotiations between all participating entities. Addressing points of contention and reaching consensus or compromise is necessary in order to avoid derailing collaborative efforts. Response model stakeholders are advised to put effort into creating and maintaining a respectful, collegial culture, in which conflicting opinions are seen as a source of strength rather than a threat: Presence of various perspectives at the table allows for deeper and more nuanced analyses of the issues and cases at hand and leads to more competent service provision (Gerassi et al. 2017; Steiner et al. 2018; Timoshkina et al. 2015). Dialogues about the underlying causes of human trafficking, such as poverty and discrimination on the basis of class, gender, race, ethnicity, sexual orientation, etc., are essential. Stakeholders are encouraged to revisit the agreed-upon principles and values on a regular basis to ensure that they are being followed in practice and to determine if any amendments or revisions should be made. If partners find themselves at an ideological or conceptual impasse, their collaborative may be divided into separate entities, which may or may not stay connected (Gerassi et al. 2017; Ricard-Guay and Hanley 2014; Timoshkina et al. 2015).

**Victim Identification Procedure**

Identification of trafficked persons is a difficult task, considering that few people self-identify as trafficked. In fact, many have never heard the term “human trafficking” or lack full understanding of the concept and do not believe that it applies to their situation (US Department of State 2018). Even those who come forward and seek help may have to be officially certified as victims of TIP in order to qualify for various supports, particularly for financial assistance and a special visa or residence permit (Dewan 2014; Home Office 2014; Macy and Jones 2011). This can be a drawn-out and delicate process as the circumstances of many trafficked persons are quite complicated and nuanced: They may be involved in a codependent relationship with their traffickers, may be facing criminal charges themselves, may be under the influence of substances, and may be too scared, ashamed, or traumatized to communicate their stories in a coherent manner and to disclose all the necessary details, which is often compounded by the language barriers (Clawson et al. 2009; Home Office 2014; Nsonwu et al. 2018). Further, helping professionals may lack specialized training necessary to recognize the signs of human trafficking (IOM 2015; US Department of State 2018). There is a common misconception among both professionals and members of the general public that trafficking victims possess a universal set of characteristics that make them easily identifiable. In reality, trafficked persons come from all walks of life. It is thus imperative for human trafficking responders to develop a clear procedure for victim identification and certification. This involves choosing relevant human trafficking indicators and developing appropriate tools and methods for data collection.
Reviews of the existing resources (see Appendix A; Hemmings et al. 2016; Macy and Graham 2012; Stoklosa et al. 2017a, b) suggest that response model stakeholders should consider five categories of human trafficking indicators (also referred to as identifiers, markers, red flags, warning signs, and risk factors). They include:

1. **Demographic indicators** such as gender, age, ethno-racial background, religion, and the level of education.
2. **Physical appearance indicators** such as the signs of physical trauma (e.g., broken teeth, broken jaw, cigarette burns, unexplained bruises, cuts, and scrapes), “branding” tattoos, and clothing and accessories suggestive of involvement in (street) sex work or inappropriate for weather/season or occasion.
3. **Behavioral indicators** such as a person acting scared, very nervous, hyper-vigilant, looking lost, confused, or appearing to be drugged (incoherent). A minor may exhibit submissive or inappropriately sexualized behavior around adults or act out in other alarming ways.
4. **Language indicators** such as inability to communicate in a majority language and the use of certain slang (e.g., indicative of involvement in the sex trade).
5. **Situational/circumstantial indicators**, which have to do with a specific form and context of TIP. They can range from the overarching macro risk factors, such as being from a country with an oppressive regime, high level of corruption, and socioeconomic and political instability or from a region ravaged by an armed conflict or environmental disaster, to poverty and homelessness and gender inequality and to more specific details of person’s employment, immigration and family situations, health status, and living arrangements. Among the latter, some of the most reliable indicators include:
   - Signs of control, such as person having no freedom of movement, no control over their finances, and being accompanied by a controlling companion
   - Person being misled about the nature or conditions of the job or promised a job that does not exist
   - Person being unable to provide home or work address and not knowing their way around
   - The lack of documentation
   - History of child sexual abuse
   - History of involvement with the child welfare system and running away

The human trafficking indicators data can be collected in several ways:

- Via direct observation only, usually when there is no real possibility to engage with presumed trafficked persons (e.g., surveillance)
- Via observation and informal conversations (e.g., during street outreach)
- Via formal interview/questioning and observation (e.g., at a port of entry, in police custody, in immigration detention center, at a social service agency, in a hospital emergency room)
- Via indirect observation and analysis (e.g., by working with case files)
As can be seen from the examples in Appendix A, depending on specific context and method of data collection, some of the aforementioned indicators may be grouped into even broader categories, such as **visual** or **observable**. Some behavioral indicators may be labeled **attitudinal**, which may be particularly useful for identifying minor victims of sex trafficking who usually exhibit sudden and drastic changes in their attitudes toward family and friends. Situational/circumstantial indicators can be broken into categories of **social, health, and other indicators** or can be aligned with the key terms used in the United Nations (UN) Palermo Protocol definition of TIP that delineates three essential dimensions of human trafficking: **acts** (recruitment, transportation, transfer, harboring, or receipt of persons), **means** (the threat or use of force or other forms of coercion, abduction, fraud, deception, abuse of power or of a position of vulnerability, the giving or receiving of payments or benefits to achieve the consent of a person having control over another person), and **purpose** (exploitation) (UN 2000, Article 3).

One of the main challenges for the responders is the development of appropriate tools to help identify trafficked persons. Fortunately, many such tools already exist and are available in public domain (see Appendix A). To avoid reinventing the wheel, response model participants are advised to build on the known resources by adapting them to their needs.

There are four categories of human trafficking identification tools that responders can choose from:

- **Lists and inventories of human trafficking indicators**, which may or may not be grouped into several sets. The presence of one or more of these indicators suggests that a person might be trafficked, and it is worth looking further into their situation. Such lists serve as basic educational resources for professionals and community members, as well as self-identification tools for potentially trafficked persons.
- **Open-ended interview guides** designed for interviewing clients in medical, social service, and other professional settings.
- **Checklists and structured questionnaires** requiring yes/no answers.
- **Standardized assessment/screening instruments**, which assign a score or a qualitative label (e.g., strong, medium, and weak) to each TIP indicator or a set of indicators and require the subsequent calculation of the overall score, on the basis of which a person can be classified as trafficked or not trafficked (See Appendix A).

Responders may also consider utilizing a traffic light evaluation system (Home Office 2014) wherein persons are classified into categories using traffic light color coding: red (“trafficked”), amber (“potentially trafficked, more information is needed”), and green (“not trafficked”). An additional status color may be introduced for specific organizational purposes.

Since TIP trends and patterns and people’s experiences are not linear, human trafficking indicators are dynamic and are likely to change over time and across different geographic areas, although some indicators may remain consistent.
Consequently, human trafficking identification tools and procedures are most reliable when tailored for a specific setting, scenario, or situation. A structured tool may be appropriate in one context, yet counterproductive in another, when the conditions are highly fluid and professionals need to keep an open mind and expect the unexpected, rather than tick boxes on a standardized checklist. Most importantly, the efficacy of any identification tool depends on its proper use (Vera Institute of Justice 2014).

Referral and Assistance Protocol

The needs of trafficked persons are multiple and diverse, encompassing physical and mental health, legal, socioeconomic, and spiritual domains. Meeting those needs requires the establishment of a strong chain of support, which will ensure the continuum and continuity of the necessary services. The term *continuum* refers to the spectrum of services, while *continuity* implies consistent, around-the-clock support that will prevent trafficking survivors from falling through the cracks in the system. Conceptually, the chain of support starts with the responders’ first contact with the presumed trafficked person and ends when the survivor achieved self-sufficiency.

Referral and assistance protocol (RAP) is meant to provide an infrastructure for seamless service delivery to trafficked persons by delineating the roles and responsibilities of the response model participants. The protocol typically emerges as a result of extensive consultations, community asset mapping, and formalized interagency partnership and collaboration agreements (IOM 2015; Timoshkina 2013; US Department of State 2018). It presents the chain of support either in a single flow chart (see Fig. 2) or in several charts for various stages/categories of response and/or different groups of trafficked persons. RAP is understood to be a living document – coordinative rather than prescriptive – flexible enough for the adjustments to be made quickly to reflect changes in the situations and resources (Timoshkina et al. 2015).

RAP should allow trafficked persons multiple points of entry, such as self-referrals, formal referrals from the police, social service organizations, health-care practitioners, government offices, law firms, immigration and court services, as well as informal referrals from family, peers, and members of the public (Home Office 2014; Timoshkina et al. 2015). Referrals can be made via a designated human trafficking hotline and a digital application or by contacting a specific responder. Responders can also establish contact with trafficked persons via outreach to at-risk groups and in known hotspots.

Upon identification, each survivor should be assigned a case manager; in some scenarios, case manager may be responsible for doing intake. The case manager is a crucial link in the chain of support as she/he ensures trafficked persons access to comprehensive services by guiding them through an often complicated and fragmented support system: she/he spends time building trust and rapport with the trafficked persons, serves as the liaison between them and responders from different
sectors, advocates for the victims/survivors, offers them ongoing emotional support, and frequently functions as an interpreter/translator and a communicator of the individuals’ cases to different professionals to prevent re-traumatization of the trafficked persons who are often forced to tell their stories numerous times (Clawson and Dutch 2008; Macy and Jones 2011; Nsonwu et al. 2018). Because survivors may resent being viewed as “cases” that need to be “managed,” the term primary contact or system navigator can be used instead of case manager. The involvement of this single point of contact with each trafficked person should be consistent throughout all stages of response (Clawson and Dutch 2008; Nsonwu et al. 2018).

RAP should cover four stages of response: immediate/crisis, short term/interim, intermediate, and long term.

**Immediate/crisis response (first 72 h–1 week).** At this stage, the responders are focused on meeting the immediate needs of trafficked persons, such as escape and protection from traffickers, emergency accommodation, basic necessities (food, clothing, personal hygiene products, footwear, access to phone and other means of communication), transportation, medical and legal assistance, and translation/interpretation services (Macy and Jones 2011; Muraya and Fry 2016; Ricard-Guay and Hanley 2014). It is recommended that service providers prepare first response bags containing toiletries and other basic supplies (Timoshkina et al. 2015; Vijendran 2017). Survivors may be exhausted and sleep deprived and thus may need 2–3 days of undisturbed rest in a safe place (Macy and Jones 2011; Muraya and Fry 2016; Ricard-Guay and Hanley 2014). Situations in which multiple victims are referred to

---

**Fig. 2** Human trafficking response model: Referral and assistance protocol (RAP)
responders simultaneously – e.g., following the police and immigration raids on suspected human trafficking sites – may necessitate the involvement of a designated multidisciplinary crisis/rapid response team and utilization of the triage approach to determine and prioritize the most critical cases (Muraya and Fry 2016; Timoshkina et al. 2015). Special provisions will be required for underage victims: A child welfare agency or a specially designated government office/program (e.g., Unaccompanied Refugee Minors program in the USA) will have to take the lead on their cases (International Labour Organization [ILO] 2006; IOM 2015; Muraya and Fry 2016). During this period, victims of all ages are particularly vulnerable and are at the highest risk of falling back into the situations of trafficking (Ricard-Guay and Hanley 2014; Timoshkina 2013). An ongoing connection with them is therefore imperative. Case manager and first responders may find themselves being on call 24/7 (Clawson et al. 2009; Timoshkina et al. 2015).

Short term/interim response (next 3–4 months). The survivors’ next few months of involvement with the support system are about contemplation and stabilization (Macy and Jones 2011). During this period, case manager should conduct needs assessments, work with each survivor to develop individualized safety and care plans, and refer survivors to the necessary services (Clawson and Dutch 2008; Macy and Jones 2011; Muraya and Fry 2016). It is important to set goals that are realistic and appropriate for where the survivors are at and to avoid overwhelming them with too much information: the primary focus should be on meeting their acute needs (Aron et al. 2006; Davy 2015; ILO 2009). Minors will require legal guardianship, foster, kinship or residential care placement, permanency planning services, specialized physical and mental health care, and other child-specific services (ILO 2006; IOM 2007, 2015). Survivors will have to decide if they wish to testify against their traffickers. Internationally trafficked persons also will have to determine whether to go back to their native country or to stay in the host nation. If survivors choose to return home, responders should offer assistance with repatriation and reintegration, which entails building connections with service agencies in sending countries (IOM 2007, 2015; Muraya and Fry 2016). Transparency is vital during this response stage: Survivors should be fully informed about their rights, limits to confidentiality, the potential safety risks, the estimated length of the legal proceedings, the lack of guarantees regarding conviction of the traffickers, as well as the pathways and prospects of obtaining permanent residence in the host country and bringing over family members (IOM 2007; Macy and Johns 2011; Surtees 2013).

Intermediate response (next 8 months). Intermediate needs of the survivors most commonly include secure shelter and transitional housing, information and referral services, financial assistance, medical and dental care, clinical counseling, emotional support, legal and immigration assistance, child care, life skills training, and help with job search (Davy 2015; IOM 2007; Macy and Jones 2011; Ricard-Guay and Hanley 2014; Steiner et al. 2018). The role of the case manager as the system navigator is particularly important during this period (Clawson and Dutch 2008). Responders may consider employing a multidisciplinary case management
team approach to dealing with particularly challenging cases (Muraya and Fry 2016; Timoshkina et al. 2015).

Long-term response (after 12 months). In the long run, the survivors will need stable and affordable housing, ongoing physical and mental health care, access to education and vocational training, life skills and financial literacy training, economic empowerment, assistance with finding employment, family reunification, and community (re)integration (Davy 2015; ILO 2006, 2009; IOM 2015; Macy and Jones 2011; Muraya and Fry 2016; Ricard-Guay and Hanley 2014; Steiner et al. 2018; Surtees 2012, 2013). International survivors will have additional needs, such as immigration and language assistance. Some survivors may be involved in protracted criminal cases and immigration proceedings and require specialized services, such as accompaniment at court hearings (Clawson and Dutch 2008; Perdue et al. 2012; Ricard-Guay and Hanley 2014). It is not uncommon for the survivors at this stage to struggle with the issues of identity and finding their place in society and be in need of continual emotional support beyond clinical counseling (Clawson and Dutch 2008; Timoshkina 2013).

Throughout all stages of response, service providers should be mindful of the impact of trauma on trafficked persons that often manifests in self-harming behavior and suicidal ideation and should carefully avoid potential triggers (IOM 2007; Timoshkina et al. 2015; US Department of State 2018).

There may be differences in the labels and timelines of the response categories, as well as the nature of services offered to trafficked persons. Some models, for example, may include pre-crisis initiatives, providing support to persons who are not yet in a position to exit trafficking (Timoshkina et al. 2015; Vijendran 2017). In other models, the immediate response category may encompass crisis and short-term responses. A three-phase response model may include rescue, recovery, and reintegration services, with voluntary repatriation for international victims incorporated throughout (Muraya and Fry 2016). Responses also may be aligned with specific government policies and regulations, especially when it comes to international victims/survivors. In the USA, for instance, programs funded by the federal and state governments under the 2000 Trafficking Victims Protection Act (TVPA) have two standard phases: pre-certification period between the time trafficked persons are identified until they are officially certified as TIP victims (about 9 months), during which individuals can receive basic services and post-certification period (about 4 months), during which survivors qualify for a full range of services (Clawson et al. 2009; Dewan 2014). The UK offers trafficking victims a 45-day reflection and recovery period, giving them access to various forms of assistance (Home Office 2014). In Canada, survivors without legal immigration status can apply for a 180-day Victims of Trafficking in Persons Temporary Resident Permit (VTIP TRP), which makes them eligible for interim federal health care, social assistance, open work permit, and a longer-term or subsequent TRP (Canadian Council for Refugees [CCR] 2018). Survivors who chose to be repatriated can be offered pre-departure and post-arrival (re)integration services (IOM 2007, 2015).
As the needs of trafficked persons vary greatly and evolve over time, it is imperative to deal with them on a case by case basis: one-size-fits-all, cookie-cutter approach to working with this population will be ineffective (Home Office 2014; ILO 2009; Ricard-Guay and Hanley 2014). Some persons will require a wide array of services, others only a few. Some of the survivors’ needs will be very specific and unique – e.g., culturally appropriate food and clothing, “branding” tattoo removal, gender reassignment services, non-Western forms of medical treatment, and spiritual healing (Hemmings et al. 2016; IOM 2007; Macy and Jones 2011). Further, survivors will require not only different types but also different levels of intensity of services, and not every individual’s journey will follow the linear immediate to long-term needs-and-responses trajectory (Macy and Jones 2011; Timoshkina 2013). Some victims may be involved with the responders for weeks while deeply entrenched in a trafficking situation. Others may come forward after having been out of the situation of trafficking for months and even years and seek assistance due to the ongoing struggles with psychological trauma, social isolation, and the lack of economic opportunities. People may be in and out of the situations of trafficking multiple times. Each survivor’s recovery from trafficking and (re)integration into community and society will be influenced by a myriad of factors, including, but not limited to, the severity of the trafficking experience, the individual’s age, health status, personality and resilience, the availability and strength of support networks, family dynamics, general economic situation in the country of residence, and the sociocultural norms and expectations (Gill 2017; ILO 2009; IOM 2015). To be effective, RAPs – and response models in general – should be developed with the understanding that not only is each trafficked person unique but that, for most, the process of reclaiming freedom and rebuilding their lives will be lengthy and trying, marred by setbacks, and that survivors may remain in need of holistic support for years (Chab Dai 2018; Macy and Jones 2011; Timoshkina et al. 2015).

Discussion

The growing body of research on health and social-service-based responses to human trafficking suggests three key elements to their success: collaboration, coordination, and centralization (3Cs).

Because the needs of trafficked persons are numerous and complex, the provision of assistance to this population calls for prolonged, competent collaboration between multiple stakeholders from different sectors. To ensure that the chain of support offered to trafficked persons does not break, collaborative entities will require meticulous coordination, which entails structure, democratic leadership, and joint applications for funding to avoid competition. Centralization encompasses person-centered model of care, central point-of-contact case management approach, and central node for information exchange, the role of which may be played by a single coordinator who will keep abreast of the partnership activities or by the coordinating body’s central/lead organization. In geographical areas where
services are few and far between, central agency may need to function as a “one stop shop” for trafficked persons in terms of the delivery of core services.

Furthermore, to ensure their effectiveness, health and social-service-based human trafficking response models should have built-in monitoring and evaluation mechanisms, and participating entities should be open to refining their practices based on evidence.

Unfortunately, a number of internal and external challenges and barriers consistently impede the effectiveness of human trafficking responses and successful outcomes for the survivors.

Sustaining productive counter-human trafficking collaborations is a monumental task. It involves dealing with a slew of administrative issues, balancing competing individual and organizational ideologies and priorities, and managing intricate group dynamics. There are inevitable tensions, power struggles, and conflicts, which may lead to the dissolution or inactivation of partnerships.

Internal challenges are compounded by external barriers. Chief among them is the scarcity of stable, adequate (government) funding for counter-human trafficking initiatives (Ricard-Guay and Hanley 2014; Steiner et al. 2018; Surtees 2013). Without it, partnership entities are unable to hire much-needed coordinators, and member organizations end up competing for grants rather than collaborating and are frequently forced to bend their programming to satisfy funding criteria, irrespective of the goodness of fit (Gerassi et al. 2017; Timoshkina et al. 2015). Consequently, trafficked persons may receive only rudimentary supports – and even those may disappear abruptly with shifting political winds (Steiner et al. 2018; Surtees 2013; Timoshkina et al. 2015).

Service-providing organizations also have difficulty attracting and retaining qualified personnel. Work with trafficked persons is intense and long term in nature, with little room for error: It requires not only tremendous dedication and often 24/7 responsibility but a unique set of professional and soft skills, particularly when it comes to case management (Clawson et al. 2009; Surtees 2013; Timoshkina et al. 2015). Because of chronic underfunding, many agencies can offer neither competitive wages, nor job security. Additionally, services to trafficked persons are often delivered in undesirable areas (e.g., “bad” neighborhoods, remote locations). Service providers face risks to personal safety and the safety of their families and are vulnerable to vicarious trauma and compassion fatigue (Andrees 2008; Nsonwu et al. 2018; Rosenberg 2008). All of this results in high levels of staff burnout and turnover, compromising the quality of service- and relationship-based collaborations (Clawson et al. 2009; Kim et al. 2018).

The persistent lack of knowledge and understanding regarding human trafficking across relevant sectors, combined with the lack of specialized professional training, presents another serious challenge as it leads to trafficked persons being routinely misidentified, criminalized, and deported (US Department of State 2018). Sometimes organizations wishing to assist trafficked persons are well-meaning, yet lack professional expertise and ethical standards of care: In the attempts to play saviors and to rescue “poor victims,” they end up patronizing trafficked persons and making decision for them, not with them, causing more harm than good (Ahmed and Seshu 2012; Surtees 2013; Wachter et al. 2016). When trafficked persons’ agency and right
to self-determination are not respected, the chain of support created for them can easily turn into shackles.

Other challenges and barriers to success include the general paucity of the necessary health and social services, especially outside the large cities, and limited access to services due to wait lists, fees, absence of transportation, restrictive eligibility criteria, and stigma (Macy and Jones 2011; Surtees 2013; Timoshkina et al. 2015). Finding suitable housing for different groups of trafficked persons – from emergency shelter to transitional safe house to affordable permanent accommodation – is a major and continual problem (Davy 2015; Macy and Johns 2011; Timoshkina et al. 2015). So is the provision of financial assistance, culturally competent interpretation, and long-term medical, dental, and mental health care (Davy 2015; Hemmings et al. 2016; Timoshkina et al. 2015). There is a critical shortage of services for trafficked children, particularly unaccompanied and separated minors, for nonheterosexual and transgender trafficking victims/survivors, and for those with criminal records and substance abuse issues (IOM 2015; Nichols 2018; Surtees 2013). Overworked and underpaid, service providers may be slow in responding to the needs of trafficking survivors. Not surprisingly, survivors may feel disillusioned and betrayed by the system and simply give up on trying to get help (Aron et al. 2006).

Arguably the most serious barrier is the dearth of economic opportunities for the survivors, especially in the economically disadvantaged countries. Survivors face numerous obstacles to labor market (re)integration, as they usually lack education, employment history, work, life and/or language skills; have no documents; are in ill health; and may be facing criminal charges (Chab Dai 2018; IOM 2015; Macy and Johns 2011; Ricard-Guay and Hanley 2014; Surtees 2012, 2013). With a few options to make a living, and often mired in debt, survivors remain vulnerable to re-trafficking and other forms of exploitation.

That said, the progress achieved in developing service-based responses to human trafficking should not be underestimated. Over the past two decades, responders around the world have made great strides in delivering services to trafficked persons and helping to create positive, tangible changes in their lives. While much more needs to be done, responders should not get discouraged: they should continue their service and advocacy efforts, learn from their mistakes, build on their successes, and celebrate their accomplishments.

**Conclusion**

Drawing on a review of the international literature, this chapter examined health and social service-based human trafficking response models, with focus on those developed in the industrialized countries. It discussed the four main building blocks of a service-based response model: (1) coordinating body, (2) set of guiding principles and values, (3) victim identification procedure, and (4) referral and assistance protocol for streamlined service delivery. It then highlighted the “3Cs” of successful service delivery and the primary challenges and barriers associated with sustaining collaborative responses and providing services to trafficked persons. Practical suggestions for ongoing and future initiatives were offered throughout the chapter.

| Covenant House New York (2013: 22–28) | Generalist Service providers Medical professionals Law enforcement Researchers | Human Trafficking Interview and Assessment Measure (HTIAM-14) – a brief questionnaire that allows to determine if a person is a victim of TIP in about 20 min:  
• Questions are divided into sections A (personal info), B (for non-US citizens only), C, D, and E.  
• The focus is on situational/circumstantial indicators, particularly person’s working conditions.  
• For every answer to the questions, a score ranging from 0 to 3 is assigned to indicate the degree/evidence of trafficking activity – e.g.,  
  0 = No evidence  
  1 = Slight evidence  
  2 = Moderate evidence  
  3 = Strong evidence  
• Responses that indicate trafficking activity receive a minimum score of 2.  
• Then scores are calculated for every section.  
• The interviewer is given space to write notes on the interviewee’s nonverbal indicators.  
• At the end of the interview, the assessor has to assign a score between 0–3 to the question, “Do you believe this person is a victim of human trafficking?” and to identify the type of TIP (check all that apply):  
  __Non-Victim  
  __Victim: Labor  
  __Victim: Sex (all ages; force, fraud, coercion)  
  __Victim: Sex (under 18; no force, fraud, coercion)  
  __Survival Sex (over 18; no force, fraud, coercion)  
  __Other |

| International Labour Office (2009) | Labor and sex trafficking | Researchers Practitioners Labor inspectors | This scientifically tested tool offers four sets of a total of 67 operational indicators for adult and child victims of trafficking for labor and sexual exploitation, aligned with the terminology of the UN (2000) definition of TIP. Each set is a structured list of indicators relevant to the following dimensions of the TIP definition:  
• Deceptive recruitment (or deception during recruitment, transfer and transportation): 10 indicators  
• Coercive recruitment (or coercion during recruitment, transfer and transportation): 10 indicators  
• Recruitment by abuse of vulnerability: 16 indicators  
• Exploitative conditions of work: 9 indicators  
• Coercion at destination: 15 indicators  
• Abuse of vulnerability at destination: 7 indicators  
Within each set, each indicator is qualified as either strong, medium, or weak. A single indicator can be strong for children, yet medium for adults, or strong for sexual exploitation, yet weak for labor exploitation.  
For each potential victim, each of the six dimensions of the trafficking definition is assessed independently from the others. The result of the assessment is positive if the dimension is present for the potential victim, negative if not. In order to be assessed as positive, a dimension must include at least:  
• Two strong indicators  
• One strong indicator and one medium or weak indicator

Abstract

This chapter will draw on the literature, policy, and research to consider the processes of investigating and prosecuting human trafficking activities across three jurisdictions. The chapter will be split into the following three sections:

1. The United Nations Office on Drugs and Crime Toolkit to combat human trafficking and themes from the UN regarding approaches to perpetrators
2. International initiatives that have developed including those within the European Union, Canada, and the United States
3. A case study of investigation and prosecution in the United Kingdom

Human trafficking · Prosecution · Modern slavery · Investigation

**Introduction**

The investigation and prosecution of those responsible for trafficking in human beings is a complex process which involves a delicate balance between securing a successful prosecution and protecting and supporting the needs of those victimized by the activity. These tensions require sensitive, multiagency approaches that operate within a framework which allows for victims’ needs to be prioritized. This is the case with many crimes, although it is heightened in relation to human trafficking based on the multiple vulnerabilities faced by many victims of human trafficking. However, it is often the case that security has been of central focus in legislative and operational approaches to tackling human trafficking, which can leave victim support underdeveloped or difficult to achieve in the context of security, particularly when linked to immigration. Having been a global priority since the mid-1990s, there has been some progress made in understanding how best to coordinate strategy to both successfully prosecute traffickers and appropriately support their victims. Concurrently, challenges remain in achieving the best outcome for all involved.

The aim of this chapter is both to identify the progress that has been made in investigative and prosecutorial processes and to highlight the challenges that remain. The chapter begins at a global level, in firstly considering the themes that initially emerged from the United Nations’ (UN) direction. The next section addresses exemplar initiatives at the European Union (EU) level and national initiatives from Canada and the United States (US) that have derived from this direction and draws out parallels between these approaches that have resulted in common problems with securing successful prosecutions. The final section provides a case study of the United Kingdom (UK) experience which considers the more detailed practical implications, the impact on victims and the challenges encountered by criminal justice professionals in investigating and prosecuting these cases.

**The United Nations Office on Drugs and Crime (UNODC) Toolkit (2008) and United Nations’ Themes**

In 1998, in an attempt to develop a binding structure on transnational crimes, the UN tasked an ad hoc committee with building a new international legal framework which has become known as the Vienna process (Gallagher 2001). This eventually gave rise
to Resolution 55/25 of November 15, 2000, and the adoption of the Convention against Transnational Organized Crime, which sought to tackle organized crime through outlining how states could cooperate on issues such as joint investigations or mutual legal assistance regarding transnational organized crime. The Convention has three additional protocols: (1) the Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children; (2) the Protocol against the Smuggling of Migrants by Land, Sea and Air; and (3) the Protocol against the Illicit Manufacturing of and Trafficking in Firearms, Their Parts and Components and Ammunition.

The motivation for the United Nations’ Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (henceforth the 2000 UN Trafficking Protocol), was to ensure criminalization of human trafficking. While the 2000 UN Trafficking Protocol was regarded as groundbreaking, as it was the first international instrument to define human trafficking (Obokata 2015), it has also been criticized for its over-zealous focus on prosecution over victim protection (Reiley 2006). This chapter also acknowledges that whilst human rights concerns played a role in the negotiations, the question of security was the primary motive for the Protocol (Gallagher 2001). In brief, many states were troubled by the impact that traffickers and smugglers were having on domestic issues. However, the 2000 UN Protocol on Human Trafficking is more than just a tool for protecting state interests. As effectively summarized by Raymond “it creates a global language and legislation to define trafficking in persons, especially women and children; assist victims of trafficking; and prevent trafficking in persons. The anti-trafficking protocol also establishes parameters of judicial cooperation and exchanges of information among countries” (Raymond 2002: 498).

Regarding prosecution of traffickers, Article 5 of the 2000 UN Trafficking Protocol obliged states to adopt legislative and other measures that may be necessary to establish human trafficking as a criminal offence, including participation as an accomplice and the organization or direction of other persons to human trafficking. In addition, subject to the basic concepts of a state’s legal system, attempting to commit the crime is also to be criminalized. Although the Protocol does not prescribe a minimum or maximum sentence, the UNODC (United Nations Office on Drugs and Crime) Model Law against Trafficking in Persons states that “sanctions should fulfil at least the threshold set for trafficking in persons to constitute a serious crime as defined in the Convention, that is, punishable by a maximum deprivation of liberty of at least four years or a more serious penalty” (Article 2 (b) of the Convention (UNODC 2009)).

The UNODC has played an imperative role in elucidating and supporting the 2000 UN Trafficking Protocol and thus, among other things, advising on the process of how best to investigate and prosecute the crime of human trafficking. This has partly been achieved through the UNODC Toolkit to Combat Trafficking in Persons of 2008 (2nd edition), which collected and disseminated successful practice in order to facilitate the sharing of knowledge and information among policymakers, law enforcers, judges, prosecutors, victim service providers, and members of the civil society working at different levels toward the overall aim of preventing and combating human trafficking, protecting trafficked persons, and promoting international cooperation.
The key lessons learned from the operationalization of the toolkit (for not all the findings can be echoed and analyzed here, see Perrin 2010) are threefold (UNODC 2008). Firstly, it is the narrative of the toolkit that all law enforcement responses must be holistic, taking into consideration a range of issues, from the rescue of victims and the protection of witnesses to the prosecution of traffickers. As such, all law enforcement persons should cooperate with other relevant stakeholders such as civil societies working with victims, local authorities who may house victims, or labor inspectors.

Secondly, the toolkit (UNODC 2008) signposts that direct witnesses of a crime are a crucial element of a successful prosecution. Consequently, most national and international documents addressing human trafficking recognize that the process of building a case and delivering a successful prosecution are more effective when the victim has continued presence in the country. Thus provisions are made to enable residence for victims, who are irregular migrants. There is an understandable truism in that much of the evidence rests on what the trafficked persons say, and that is why trafficking investigations and prosecutions require that law enforcement officials work to establish a trusting relationship with the victim. However, this is not without challenges due to distrust of law enforcement agencies and fear that they may be prosecuted for crimes they were compelled to commit in the course of the trafficking situation (discussed further below). Some victims refuse to cooperate, some are too traumatized, and they disappear or are re-trafficked. To address this, there are moves to run “victimless prosecutions,” which in the United Kingdom have been used in cases of domestic violence (see Lee Stewart Barnaby v The Director of Public Prosecutions [2015] EWHC 232). At the time of writing, there was one case in the United Kingdom of a victimless prosecution under the Modern Slavery Act, concerning human trafficking for the purposes of sexual exploitation (see Open Minds Foundation 2016 for a discussion on this point).

Lastly, the toolkit (UNODC 2018) places increased emphasis on training and training resources to reinforce law enforcement and peacekeepers’ ability and capacity to respond to human trafficking. This is now an accepted practice. However, it is important to acknowledge that training is required far beyond the law enforcement domain. Undeniably, a large group of persons remain outside the “authorities’ field of vision” (Rijken and Koster 2008: 6). Yet an important aspect in reducing human trafficking is precisely the ability to recognize it, support those affected, and find an appropriate and long-term approach for their recovery. It is consequently suggested that a professional likely to be working with a potential trafficked person needs to “be aware of what facts may point to the client having been trafficked and to be aware of what to do when they are alerted to the possibility that this may be the case” (Drew 2009: 3). This is pertinent to frontline staff, such as medics, teachers, and staff from local authorities and those working on distribution of benefits. They are often the first to see victims. Thus, they need to be equipped with up-to-date knowledge and skills surrounding the crimes, to optimally respond to potential victims. This is evidenced by the European Directive 2012/29/EU (Art. 25) and Directive 2011/36/EU, which recommend the adoption of training and education mechanisms for workers in sectors most likely to meet potential victims/perpetrators. In turn, this may help with the investigation and prosecution of traffickers, although the onus largely remains on victim evidence and participation.
(Resultant) International Initiatives

This section is focused on the way in which the global framework has translated into approaches on a smaller scale. The discussion below is shaped around EU, US, and Canadian approaches to prosecution to highlight shared challenges and successes in building frameworks to successfully respond to human trafficking as well as identifying divergence in these initiatives.

The EU

Significant investment of resources and time, through consultations and drafting, has been dedicated to respond to a crime that the European Commission (EC) has described as “a serious crime against persons” (European Commission 2005: 1). Directive 2011/36/EU of the European Parliament and of the Council of 5 April 2011 on preventing and combating trafficking in human beings and protecting its victims represents the focus of the EU strategy to addressing human trafficking. It is based on the three P-paradigms: prosecution, protection, and prevention; and resultant state obligations in the directive concern all three aspects. The Directive is progressive in an increased focus on victim protection (Art. 8, 11–17) and action to prevent the crime (Art. 18). Article 2 which provides the definition of human trafficking obliges states to take the necessary measures to ensure that human trafficking is punishable. The Directives return to investigation and prosecution in Article 9 which obliges states to ensure that investigation into or prosecution of human trafficking is not dependent on reporting or accusation by a victim and that criminal proceedings may continue even if the victim has withdrawn his or her statement. Again, this showcases the importance of due diligence in gathering evidence and a departure from the initial global emphasis, described above, where the victim was key to prosecutions. This is essentially making him/her more of a witness than a person deserving of rights. It is argued here that law enforcement and prosecutors need to move beyond “traditional” investigation, and as stated by Gallagher, “due diligence may also require that investigators do not just rely on complaints from victims but actually go out and investigate on their own” (Gallagher 2010: 384).

The Directive’s approach does appear to distance itself from linking victim protection with compulsory assistance, from the victim, in the prosecution process. Paragraph 18 of the Recital states that “a person should be provided with assistance and support as soon as there is a reasonable-grounds indication for believing that he or she might have been trafficked and irrespective of his or her willingness to act as a witness.” The same is found in Art. 11(3): “Member States shall take the necessary measures to ensure that assistance and support for a victim are not made conditional on the victim’s willingness to cooperate in the criminal investigation, prosecution or trial, without prejudice to Directive 2004/81/EC or similar national rules.” This importantly limits the discretionary powers of the states in which assistance and support can only be granted if the victim cooperates with the authorities in criminal proceedings. However, as above, Article 11(3) also states that unconditional access to support is
without prejudice to Directive 2004/81 or any similar national rules. In short, Directive 2004/81 grants a temporary residence permit to third-country nationals who are a victim of human trafficking and who cooperate with the authorities. This means that based on this Directive, trafficked victims can only access support and assistance provided in accordance with this Directive if they cooperate with the authorities and is limited to the duration of criminal proceedings only. This seems to be in full contrast with the unconditional access articulated in Article 11 (3).

Further, Paragraph 14 of the Recital reads that the aim of the non-prosecution and non-punishment principle (found in Art. 8) “is to safeguard the human rights of victims, to avoid further victimization and to encourage them to act as witnesses in criminal proceedings against the perpetrators” (emphasis added). It seems incongruous to, on one hand, state that protection is not linked to prosecution and on the other state that protection is carried out to encourage successful prosecutions.

Troublingly for the EU, successful prosecution of trafficking cases remains a challenge. The European Commission’s 2016 report on the progress made in relation to human trafficking analyzes the main actions undertaken by states (report as required under Article 20 of Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims). According to the report, the level of prosecutions and convictions remains worryingly low, especially when compared to the number of victims identified (European Commission 2016). The cases are often complicated and have a transnational aspect and poor evidence. To facilitate successful prosecution, the Commission encouraged Member States to establish national multidisciplinary law enforcement units on human trafficking which should closely cooperate with Europol and be able to exchange information with local, regional, and national law enforcement units (European Commission 2016). Furthermore, Member States are encouraged to increase cross-border police and judicial cooperation in trafficking cases and make use of all relevant avenues for such cooperation and in particular the establishment of joint investigation teams (JIT) and using Europol and Eurojust (the European Union’s Judicial Cooperation Unit). The European Commission (2016) also encouraged the use of corroborative evidence including financial investigations, which should be proactively conducted in all trafficking cases. These recommendations have the potential to shift the burden of successful prosecution away (or at least to share it with) trafficked victims toward a broader spectrum of evidence.

Canada

Human trafficking has become a significant policy issue for successive Canadian governments. A review of legislation in 2005 found that the legislation favored “preventative and prosecution measures but fail[ed] to provide protection to the basic rights of trafficking victims” (Oxman-Martinez et al. 2005a: 30). This reflected the global focus on security as opposed to human rights although an early review of the situation in Canada highlighted the need to work effectively with countries of destination to target the “structural causes of human trafficking” (Bruckert and
Parent 2002: 26). Canada was among the first set of countries to ratify the Protocol, and the 2012 National Action Plan to Combat Human Trafficking (the Action Plan) (Government of Canada 2012) represented the first action plan of this kind for Canada, formally documenting Canada’s anti-trafficking approach. The Canadian government began by developing tools for the prosecution of traffickers, in line with the recommendations of the Protocol (Oxman-Martinez et al. 2005b). In 2012 the legislation was introduced to prosecute Canadians for human trafficking offences while not in Canada (Bill C-310 Criminal Code of Canada) building on legislative amendments in 2010 which increased minimum sentences from 2 to 5 years. A former private member’s bill was introduced into the Canadian legislation in early 2017 which amended previous anti-trafficking legislation with the aim of giving “law enforcement and prosecutors new tools to better investigate and prosecute human trafficking offences” (Government of Canada 2017a). One of these tools in this recent legislation facilitates the proving of the element of control over a victim through evidence of the perpetrator living with the victim or being habitually with them as evidence of control. The legislation also placed the onus on traffickers to prove that their property was not proceeds of crime and made it easier for proceeds of crime to be seized.

The Action Plan and the Criminal Code of Canada recognized the necessity of measures to “make testifying less traumatic for victims” (Government of Canada 2012: 8) and introduced testimonial aids such as the ability to testify from an alternative location to the court room and support of other people (such as victim support representatives) while testifying. Trafficked victims are not required to provide evidence in court to gain temporary or permanent residence. Additionally, free legal advice was introduced for victims in Ontario in 2018 (Malo 2018) having been previously recommended by victim service providers (Oxman-Martinez et al. 2005a).

In relation to prosecution, the Action Plan highlighted targeted training and the establishment of a dedicated integrated investigative team (the importance of cross-sector collaboration has also been highlighted in research elsewhere; see Winterdyk 2017). This multiagency model reflects policy developments in the United States and the United Kingdom discussed below that are considered to strengthen anti-trafficking initiatives. The Action Plan acknowledged the small number of convictions at the time of publication which numbered 25 convictions specifically for human trafficking offences between 2005 and the publication of the Action Plan in 2012.

The first successfully prosecuted human trafficking case in Canada is known as the Domotor case and was “hailed as a significant milestone in the fight against human trafficking in Canada” (Hastie and Yule 2014: 83). The case involved a large group of “organized” criminals who exploited 19 known victims in their construction company. However, Hastie and Yule (2014) were cautious regarding the impact of and successes highlighted in this case. They identified gaps in the response to human trafficking cases revealed by the case: the lack of victim support for male victims and issues related to the provision of interpreters and translators during the criminal justice process. The case particularly highlighted the focus of the Action Plan as “nearly entirely on a crime-control approach...and makes no commitment in respect of service provision” for victims (Hastie and Yule 2014: 91).
Since its inception, the Action Plan has been reviewed annually to evaluate and monitor the progress made. The 2016–2017 horizontal evaluation of the Action Plan identified progress in terms of awareness raising and victim support. However, investigation and prosecution remained more challenging areas due to constraints across different jurisdictions such as differences in local practice and information sharing and difficulties in gathering evidence (Government of Canada 2017b) further complicated by the investigation and prosecution of trafficking cases at a provincial and federal level. The Action Plan was evaluated against the aims of establishing a dedicated integrated enforcement team, providing training and education for criminal justice professionals, and enhancing intelligence collection and coordination. The evaluation found that the number of charges, prosecutions, and convictions remained low (a similar problem to the EU, as above): there were 307 human trafficking cases from 2012 to 2016 and 45 human trafficking-specific convictions. The difference between the number of cases and convictions represents patterns elsewhere and exemplifies the challenges for law enforcement in pursuing human trafficking investigations. The evaluation found that victims remained “reluctant to testify for fear of reprisals by the traffickers” (Government of Canada 2017b) despite progress made in terms of victim support. However, the Action Plan does not identify any specific and measurable action points in relation to investigation and prosecution.

In common with other jurisdictions, “despite the adoption of legal mechanisms, Canada has faced major challenges when prosecuting human trafficking” (Winterdyk 2017: 223). Millar et al. (2017) identified several problems with both researching the investigation and prosecution process (lack of available information, lack of understanding of human trafficking by criminal justice professionals, and lack of consistency in definitions in reporting offences) as well as with the process itself. Trying to discern information relating to the progress of the case from charge to prosecution illustrated “how challenging it is to obtain and triangulate primary legal data in Canada” (Millar et al. 2017: 48), the experience of which has been reflected in the United Kingdom (see Gadd et al. 2017). Given the low numbers of convictions and issues with prosecution, “Canadian trafficking case law developments are in their early stages” (Millar et al. 2017: 34). Police have encountered “significant barriers to obtaining cooperation from victimized individuals” particularly as the individual often faces job loss and deportation (Winterdyk 2017: 222).

The Trafﬁcking in Persons Report (2018: 130) identiﬁed Canada as a tier 1 country stating that the Canadian government had “continued to demonstrate serious and sustained efforts during the reporting period.” However, the report also identiﬁed problems in relation to convictions by the Canadian government, particularly with regard to convictions for labor-related exploitation, noting a “continued imbalance in the government’s anti-trafficking efforts, with greater attention to and understanding of sex trafficking versus forced labor”(2018: 131). As in other places, the dominant construction of human trafficking as a problem of the sexual exploitation of women and girls has caused problems for the identiﬁcation and investigation of other types of trafﬁcking (Winterdyk 2017; Spencer and Broad 2012). The continued focus on sexual exploitation noted here in Canada and reﬂected in other areas is problematic as where victim experiences “fall outside the narrow criminal
justice mandate and resource allocation. . .[they] may not be able to access services that are tied. . .to some form of criminal investigation” (Winterdyk 2017: 228).

Despite a long-standing commitment to the problem of human trafficking, Canada has continued to encounter problems at a practical and legal level relating to successful prosecutions for specific trafficking offences. The progress has been made in relation to the development of multiagency approaches, but the continued centrality of law enforcement in anti-trafficking discourse is problematic. “Despite a legally untested definition and a limited number of criminal cases, law enforcement and criminal justice actors have largely shaped discussions of human trafficking and responses to trafficking in Canada” (Winterdyk 2017: 221). There therefore remains a need for increased coordination with other agencies (Kaye et al. 2014).

The United States

The Trafficking Victims Protection Act (TVPA) was passed in 2000, and the TVPA Reauthorization Act 2008 required states to legislate for criminal prosecution of trafficking to continue any humanitarian and assistance to those states, further incentivizing those states to take positive action. The US Government encouraged the development of state-level anti-trafficking legislation such that all states now have relevant trafficking laws to “give the local police the tools necessary to be actively involved in the detection, arrest and prosecution of traffickers” (Schauer and Wheaton 2006: 159). The Annual Trafficking in Persons (TIP) Reports produced by the US Department of State (see US Department of State 2018 for the most recent report at the time of writing) categorize countries into tiers based on the extent to which human trafficking is recognized as a problem, the efforts made to address the problem of human trafficking, and the extent to which the countries’ efforts meet the minimum requirements of the TVPA. In 2007, the Department of Justice (DOJ) formed the Human Trafficking Prosecution Unit (HTPU) as a specialized unit to deal specifically with complex human trafficking cases of national significance (DOJ 2017). As above, pressure placed on jurisdictions through the tiering system of the TIP reports and the contingency of assistance because of anti-trafficking measures places the United States at the forefront of anti-trafficking approaches. The dominant position of the United States in the current anti-trafficking discourse has been said to “force other countries to get serious about prosecuting cases of slavery” (Allain and Bales 2012: 1).

Despite progress made and the significance of US policy and legislation, little is known about the effectiveness of anti-trafficking strategy in the United States and the consistency of efforts across states (Farrell et al. 2013). As in other countries, the numbers of prosecuted cases across the United States remains low (there were approximately 1876 prosecutions for federal human trafficking and 450 at state level between 2000 and around 2016 (Farrell et al. 2016)). There are issues with the investigation of human trafficking cases at a local level with the majority of cases involving trafficking for sexual exploitation of US citizens. The few perpetrators that are charged are frequently charged with lesser offences where the penalties are less
severe (Farrell et al. 2013). The relatively infrequent use of the legislative tools has meant that prosecutors are unfamiliar with the legislation and this is especially the case with trafficking for labor exploitation, where the numbers are smaller still (Farrell et al. 2013). Due to the dual criminal justice system in the United States (in a pattern similar to that identified in Canada, above), this is compounded at state level, where state prosecutors have less experience of human trafficking cases than at the federal level (Farrell et al. 2016). Lastly, there is a lack of specialist units dedicated to the problem of human trafficking, particularly in smaller areas (Farrell et al. 2013; Reid 2012).

The National Strategy to Combat Human Trafficking (US Department of Justice 2017) identified bringing human traffickers to justice as one of the priorities for the DOJ through (among other measures) strengthening multiagency partnerships and capacity building for victim support, as observed in the discussion regarding EU and Canada above. Here, it is worth bringing to attention the Human Trafficking Task Force e-Guide, hosted by the Office for Justice Programs website (US Department of Justice 2018). The Office of Justice Programs (OJP) provides innovative leadership to federal, state, local, and tribal justice systems, by disseminating state-of-the-art knowledge and practices across the United States and providing grants for the implementation of these crime-fighting strategies. The ethos of this tool is well described on the website stating that it is impossible for any single agency or organization to respond comprehensively to the problem of human trafficking. The e-Guide acknowledges that traffickers’ range from opportunistic individuals to sophisticated criminal organizations, with multijurisdictional activity. The resulting victimization is described as extreme and involving diverse populations with a host of needs. The response to human trafficking is described as most effective, coordinated, and efficient through multidisciplinary and collaborative problem-solving efforts. The guide is in comprehensive language, but not at the cost of being superficial, and provides excellent information on what is human trafficking; how to form a task force; how to operate a task force (including community-based partnerships and information sharing); what supporting victims ought to entail; who are the victims (uniquely including information on LGBTQ victims and victims with physical, cognitive, or emotional disabilities); how to build strong cases; and the role of courts (including ethical consideration and use of innovative court responses). This guidance may provide a useful template for countries at the stage of developing anti-trafficking tools.

Following the Justice for Victims of Trafficking Act, all US attorneys’ offices have developed local strategies to improve victim identification and the investigation and prosecution of human trafficking crimes (DOJ 2017). Within this framework, the strategies identify the importance of using evidence other than or in addition to that provided by the victim, similar to recommendations made in the EU (European Commission 2012). However, there remains a greater burden on victim evidence. The dependence on victim testimony combined with the complex relationships between traffickers and their victims results in problems with prosecutions (Farrell et al. 2013). Elsewhere, Farrell and colleagues (Farrell et al. 2016: 52) highlight that “extra-legal factors such as suspect and victim characteristics and the victim’s
relationship to the suspect also influence the decision to prosecute a case.” This is similar to what happens in a domestic violence case. Unsurprisingly, there is a worry that where victims do not fit the ideal image of what a victim ought to look like (a weak, passive female who did not contribute to the crime done against her), prosecutors will decide not to prosecute, thus denying the victim a chance of justice (Srikantiah 2007).

In the abovementioned Human Trafficking Task Force e-Guide, the chapter on building strong cases begins with victim-centered investigations, illustrating how the role of the victim remains key. The e-Guide states that victims are crucial to human trafficking investigations and prosecutions. In many human trafficking cases, only the victim can explain the coercion and control that is a basic element of the crime of human trafficking. As discussed, this is of course true, but it does risk victims becoming a tool to a state-focused end of increasing levels of prosecutions. The e-Guide however is revolutionary in its attempt to consider how to ensure victim involvement in a way that guards the victim’s dignity, for instance, by empowering victims and providing them with recourses that could help the victims tell their stories. This is certainly a more preferred avenue than for instance offering them advantages such as residence permits in exchange for cooperation. The latter is a tactic that may backfire: “[i]t has been pointed out that offering residency conditioned upon testifying can backfire in court and provide opportunity for the defence to draw into doubt the veracity of the testimony, or indeed, even induce exaggeration of information in order to obtain a residence permit” (Brunovskis and Skilbrei 2016: 18). Of note however is that across the United States, suspects are more likely to be charged where there is additional evidence to corroborate the victim’s evidence (Farrell et al. 2016) which may indicate a movement away from a narrow reliance on victim testimony alone or alternatively may exemplify the doubt which can meet testimony of victims where there is no additional supporting evidence.

**Investigation and Prosecution Case Study of the United Kingdom: Challenges and Best Practice**

England and Wales’ 2015 Modern Slavery Act (hereinafter MSA) was the result of a wave of new governance around efforts to address human trafficking and slavery. The legislation aimed to consolidate existing offences, simplify the legislation, and provide stakeholders with relevant tools and powers to fight the crime. It also required UK companies with a turnover above £36 million per annum to produce a statement setting out how they ensure modern slavery is not taking place in their business or their supply chains. The act also created the Independent Anti-Slavery Commissioner. The role of the Commissioner is to identify and promote best practice in anti-trafficking responses as well as to drive improvement across these responses in the United Kingdom and internationally. However, the first Commissioner resigned in May 2018 citing government interference in his role (Press Association 2018) and illustrating additional problems with the governance of the problem of human trafficking (Broad and Turnbull 2018).
The development of the MSA has marked a diversion, particularly in terminology, within the EU frame although other Member States are in the process of developing “modern slavery” legislation (e.g., France, along with other, non-EU countries such as New Zealand and Australia (Broad and Turnbull 2018)). Among other changes, the Act has replaced previous legislation that fell under several different acts under a single act (for an overview of UK policy development, see Broad and Turnbull 2018; Craig 2017). The legislative changes were partially prompted by recognition from those working within the sector of the poor levels of victim protection and support, particularly through investigative processes (through the anti-trafficking monitoring group’s collaborative report: (ATMG 2013), also see CSJ 2013). The report found that the previous disparate legal framework was “confusing and potentially misleading” (ATMG 2013: 10). This had resulted in a disproportionately low number of convictions for trafficking offences as well as the inability of trafficked victims to access adequate protection as required through the 2005 Council of Europe Convention on Action against Trafficking in Human Beings and European Union Directive 2011/36. In addition, the issue of balancing victim support with migration concerns had previously led to criticism of the commitment to victim care in the context of the removal of undocumented migrants (Balch and Geddes 2011). A context where victims are unsure of their ability to access support and what the implications of reporting their victimization may be will prevent their participation in the investigative process.

The MSA aimed to increase the numbers of prosecutions and convictions, particularly through international cooperation, working with partners, and by providing better support for victims and witnesses through court proceedings (HM Government 2015). However, reports released at the end of 2017 and early 2018 indicated little improvement. In particular, a report from the National Audit Office (NAO) (2017) on public spending on reducing modern slavery stated that although the United Kingdom had an identification and support system in place (the National Referral Mechanism (NRM)), there are numerous shortcomings. The criticisms concern victim care, including that the Home Office has been very slow to implement improvements to the NRM, despite recognizing a series of problems in 2014 (NAO 2017: Para. 14). In addition, NRM decisions on whether the person has sufficient evidence to be identified as a victim are slow, causing distress and anxiety to vulnerable people in the NRM system (NAO 2017: Para. 16). Decisions are made by trained individuals who work for “competent authorities” or first responders including the police, UK Border Force, Home Office Visas and Immigration, and several anti-trafficking NGOs. In recognition of problems with the NRM decision-making system, a pilot scheme was introduced and evaluated in 2017 (Home Office 2017). The decision-making within the pilot involved a more specifically trained and experienced decision-maker charged with making the decisions. The pilot was evaluated with generally positive results although this system has not yet been implemented at the time of writing (see Home Office 2017 for more information). Regarding prosecution the key conclusion is that there have been few prosecutions and convictions under the MSA, again similar to trends elsewhere. The report states that:
In 2016, only 80 defendants were prosecuted under the Modern Slavery Act for 155 modern slavery offences, rising from 26 in the previous year for 27 offences. This legislation can only be used for crimes committed after the Act was introduced and as modern slavery cases take a long time to build (two to five years) it is difficult to benchmark. There has been increasing use of the Modern Slavery Act to prosecute defendants, although the overall volume of prosecutions related to modern slavery is relatively small. In 2016, there were 349 completed prosecutions of defendants flagged by the CPS (Crown Prosecution Services) as being involved in modern slavery, of which 62% resulted in conviction. Despite this conviction rate being in line with other hidden crimes, a small proportion of the crimes recorded by the police result in a charge. The average length of a custodial sentence for modern slavery between 2014 and 2016 was around four years. The Modern Slavery Act has set the maximum sentence to life in prison, but that sentence has not yet been used. (NAO 2017: Para. 21)

This effectively summarizes the consistent and continuing problems with investigative and prosecutorial processes in the United Kingdom but also reflects themes identified throughout this chapter in other jurisdictions.

Undeniably cases on human trafficking are complex and include numerous actors, transnational networks, missing witnesses, and frequently inexperienced law enforcement officials. Another reason that cases of human trafficking are complex to prosecute is the fact that they do not only entail criminal law but also administrative law, international cooperation, and complex financial investigations. In response to this, the Group of Experts on Action against Trafficking in Human Beings (GRETA) (2014) encouraged the specialization of judges. A previous GRETA report (2012) stated that an increase in training of those involved in the prosecution process could improve effective evidence collection and subsequently increase related prosecutions in the United Kingdom. These recommendations have been promulgated by a range of experts but have been slow to be implemented.

A final problem concerns financial investigations as part of the criminal investigations – related financial investigations are few even though investing in better financial investigations would benefit the possibilities of forfeiture, which could ideally benefit the victim. According to the European Commission (2012: 9–10), “[e]vidence gathered from money trails might provide the necessary additional proof, particularly in high-risk sectors, thus relieving victims of the burden of testifying in court.” The United Kingdom has existing money laundering offences under the Proceeds of Crime Act 2002 (POCA) that can be used to disrupt criminal finances. There are also separate regulations that protect the financial sector and other related businesses from being used for money laundering and help to identify suspicious financial activity. The POCA also has various means to recover the financial benefits made through any crime, namely, confiscation following any criminal conviction, civil recovery in the High Court, cash forfeiture in the magistrates’ courts, and taxation. The legislation also provides specific investigation powers to ascertain the extent and whereabouts of the proceeds of crime. The key is thus to raise awareness and encourage the use of legal provisions that allow for financial investigations and recovery of criminal assets. Efforts should be put into integrating financial investigations into trafficking cases on a regular basis (Keatinge 2017).
Conclusion

This chapter has aimed to provide a review of the investigation and prosecution of human trafficking cases to identify themes in relation to challenges and progress in this regard. The forefronting of the international policy frame as more focused on security than human rights from the outset appears to have had long-term implications in framing national responses. Starting from a point of law enforcement and prosecution has led many countries to identify that their approaches to victim protection were lacking in support. However, incorporating effective victim protection at the same time as necessarily pursuing prosecutions has proven difficult. While some progress has been made in this area in relation to multiagency working and capacity building for victim support services, there remain significant barriers to providing effective levels of support that enable victims both to have the necessary support to recover from their victimization and also to work with the criminal justice system to assist in successful prosecution.

Despite positive changes in the investigative process and as acknowledged at all levels, from the global to the local, law enforcement is only one very small part of a much bigger picture. Wider structural inequalities must be tackled to provide better opportunities in countries of origin for those who eventually find themselves bound up in human trafficking activity – for both victims and perpetrators. Encouraging participation in the prosecutorial process for victims who may ultimately find themselves returned to their country of origin is not a viable option if there are no legitimate work opportunities in those countries. Philosophically treating victims as witnesses rather than as person’s who are owed rights is problematic. In addition, failing to develop adequate frameworks of rehabilitative work (a discourse that receives very little attention) with those who have perpetrated these crimes may see them returned to the same networks and needs that they had prior to prosecution.

The move toward multi-agency models partly recognizes the need for a coordinated approach to build the frameworks necessary to adequately support victims and identify effective evidence to prosecute traffickers. It also acknowledges the futility of trying to understand the picture from a national level: while it is important to piece together information to build a wider view, learning from the local manifestation of human trafficking activity and the successes and challenges facing local collaborations can effectively inform national strategy, as much as a top-down approach (also see Winterdyk 2017). Those who are working in anti-trafficking on a daily basis are often those with the most knowledge, and these views are vital in developing policy.

According to this review, there are significant challenges in the operationalization of anti-trafficking legislation. In considering the implementation of legislation, Farrell et al. (2013: 141) state that legislation does not necessitate or explicate operational change, “unless criminal justice organizations actively seek change...there will be a lag or even a complete disconnect between the enactment and the enforcement of new laws.” The enactment of legislation can only represent the start of the process. As illustrated across jurisdictions, local experience of working with the (inter)national guidance to achieve successful outcomes in trafficking cases is a work in progress.

Abstract

The United Nations Office on Drugs and Crime (UNODC) Global Report on Trafficking in Persons of 2016 amply demonstrates that no country is immune from trafficking, yet public awareness and perception remains uneven, both globally and also specifically in India. There are also adequate international standards calling upon Member States to generate public awareness and strengthen capacities of duty bearers on human trafficking. On the other hand, the actors of the criminal justice system, namely, the police, the prosecutors, and the judiciary, as well as the labor officials, immigration, medical, and other professionals, often do not have adequate knowledge and training of the counter-trafficking legal framework and its application. Against this backdrop, the

J. Winterdyk, J. Jones (eds.), The Palgrave International Handbook of Human Trafficking, https://doi.org/10.1007/978-3-319-63058-8_44
chapter examines the reasons for the gaps in awareness among the general public. It also assesses gaps in the legal knowledge among the general public and the duty bearers with legal responsibilities and its consequential impact on combating human trafficking, globally and with special reference to India. Current government and nongovernment initiatives from India towards legal and public education on human trafficking are discussed, and some recommendations are provided in the conclusion.

**Introduction**

The poignant words of India’s President, Shri Ram Nath Kovind, during his meeting with survivors of human trafficking on the occasion of International Women’s Day on March 8, 2018, demands reflection:

> Human trafficking is a social evil. It is not a common crime but a crime against humanity. The entire society must unite for its eradication. Awareness should be increased. People should also be encouraged to urge the survivors of human trafficking into the mainstream of society and help them overcome their problems. We need to create an appropriate ecosystem for survivors. …

Trafficicking in persons (hereinafter, TIP) is the fastest growing organized crime in the world. The crime generates illegal profits obtained from the use of forced labor at more than $150 billion USD every year (ILO 2014). It creates an estimated total annual profit made from forced sexual exploitation at USD $99 billion worldwide (ILO 2014), with an estimated 24.9 million people its victims. An estimated 16 million people are likely to be in forced labor in the private economy and 4.8 million in forced sexual exploitation (ILO 2017). An estimated 79% of all detected trafficking victims are women and children (UNODC 2016). Despite the obvious formidability of this problem, it remains hidden in plain sight, continues to destroy lives, and weakens the social and economic fabric of nations.

As much as these statistics are alarming and horrifying – they lose the essential element of “a” human victim.

The United Nations Office on Drugs and Crime (UNODC) Global Report on Trafficking in Persons of 2016 clearly establishes that no country is immune from trafficking. Victims are trafficked along a multitude of trafficking flows, within countries, between neighboring countries, and even across different continents. The report detects more than 500 different trafficking flows between 2012 and 2014. There seems to be a relation between a country’s level of development and the age of detected trafficking victims. In the least developed countries, children often comprise large shares of the detected victims.
Trafficking in Persons in India

India is a source, destination, and transit country for men, women, and children subjected to forced labor and sex trafficking (UNODC 2013; US TIP Report 2018), which constitutes the two predominant forms of TIP. Estimates suggest that millions of Indian women and children are victims of sex and forced labor trafficking, the latter affecting millions of men as well. Other forms of trafficking – organ transplant, forced marriages, illicit adoptions, and children being recruited as child soldiers by non-State agencies – are also prevalent in India.

Forced labor takes the form of men, women, and children in debt bondage, sometimes inherited from previous generations, who are forced to work in brick kilns, rice mills, agriculture, and embroidery factories. Forced labor also exists in sectors, such as construction, steel, and textile industries, wire manufacturing for underground cables, biscuit factories, pickling, floriculture, fish farms, and ship breaking (a type of ship disposal involving the breaking up of ships for either a source of parts, which can be sold for reuse, or for the extraction of raw materials, chiefly scrap). Thousands of unregulated work placement agencies reportedly lure adults and children under false promises of employment into forced labor, including domestic servitude (UNODC 2013; US TIP Report 2018).

Traffickers use traditional methods of entrapment through false promises of employment or “boyfriend” relationships, or arrange sham marriages and lure women and girls into sex trafficking. But the new trends reflect that they are increasingly adapting their modus operandi by using websites, social media, mobile phones, mobile applications, and online money transfers to trap victims and facilitate commercial sex (UNODC 2013; US TIP Report 2018).

Besides trafficking of women and girls within the country, several other nationalities are being subjected to sex trafficking in India. These include nationals from Nepal, Bangladesh, Thailand, as well as and from Europe, Central Asia, and Africa (UNODC 2013; US TIP Report 2018).

Crime statistics from the government’s “Crime in India” report (National Crime Records Bureau (NCRB) 2016) provides the following data on TIP:

<table>
<thead>
<tr>
<th>Total cases in 2016</th>
<th>8132</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of victims trafficked</td>
<td>15,379</td>
</tr>
<tr>
<td>Female victims</td>
<td>10,150</td>
</tr>
<tr>
<td>Male victims</td>
<td>5,229</td>
</tr>
<tr>
<td>Total number of victims under 18 years</td>
<td>9,034</td>
</tr>
<tr>
<td>Total number of rescued victims (rescued persons may include persons trafficked in previous year also)</td>
<td>23,117</td>
</tr>
</tbody>
</table>

The Crime in India report shows that filed cases of human trafficking rose by almost 20% in 2016 against the previous year, but anti-trafficking activists believe that these figures failed to reflect the true magnitude of the crime (Nagraj and Bhalla 2017). Activists attributed the rise in cases to greater public awareness and increased police training, resulting in better enforcement of anti-human trafficking laws.
Unofficial government sources also believe that “more victims are coming forward and reporting because of more information about trafficking, government and civil society groups are doing campaigns and people are also seeing more cases being reported in the media” (Bhalla 2017).

Available statistics from India are not a true reflection of the problem’s estimated scope. A large number of cases are unreported as per NGO accounts and other stakeholder reports, with many people still unaware of the crime or lacking confidence to seek police help. Even one victim, one crime, is too many, but a constant challenge is how to measure its exact magnitude. Countless commentaries can be written on the enormous diversity of the data globally as well as in India, which is available through UN reports, international and national NGOs, and official government sources. Globally, estimates range from 4 million victims per year (UNODC 2016) to 27 million per year (Bales 2012). The varying estimates both globally as well in India result from various factors. Some of these are, the clandestine nature of this crime, existing problems with the legal definitions of trafficking in specific national jurisdictions, scarcity of comprehensive data about the scope of the problem, and the dearth of systematic empirical research. Considering these factors, the disparity in quantitative estimates becomes increasingly unsurprising.

What is not disputed, however, is the heinousness of the crime, which requires immediate responses. Albeit, it also needs to be stated upfront that the extent of the trafficking problem determines the strategies for creating awareness, developing policies and plans towards prevention of trafficking and rehabilitation of victims, and the resources required to build capacities of all relevant stakeholders. Nonetheless therefore, coherent and comprehensive responses to TIP cannot be stymied due to the unavailability of accurate figures, whether based on the magnitude and incidence of the crime, or on the number of victims.

The “3P” paradigm to counter trafficking in persons – prevention (of crime), protection (from crime), and prosecution (of criminals) – continues to serve as the fundamental international framework described by the UN Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (hereinafter, UN Trafficking Protocol), supplementing the United Nations Convention against Transnational Organized Crime of 2000. A fourth dimension, namely of partnerships, broadly understood as a multidisciplinary and multistakeholder approach to counter trafficking, has been added in recent years (Four “Ps”: Prevention, Protection, Prosecution, Partnerships 2010). The four Ps strategy is being followed in India too for a comprehensive approach to anti-trafficking measures.

India has ratified the UN Trafficking Protocol, as an expression of its political will to counter human trafficking. However, ratification in itself is not sufficient to ensure its effective implementation and impact on the ground. Whereas protection of victims and prosecution of offenders are steps to be taken after the crime has taken place. Prevention of trafficking is the stage at which maximum public awareness can be created towards preventing the crime from occurring in the first place.
International Standards and Guidelines with Reference to Awareness and Knowledge of Trafficking in Persons

The UN Trafficking Protocol lays down the international standards on public awareness and training of duty bearers. Member States are obligated to comply within their domestic laws and systems the building of public awareness and training of duty bearers. Article 9, Paragraph 2 of the UN Trafficking Protocol provides that for prevention of trafficking in persons, the State Parties shall endeavor to undertake measures, such as “research, information and mass media campaigns” along with social and economic initiatives.

Apart from standards laid down in the UN Trafficking Protocol, the “Annotated Guide to the UN Trafficking Protocol” provides further guidelines on implementing the provisions of the Protocol. The Annotated Guide, with respect to Article 9 of the UN Trafficking Protocol, states:

- Research is important in understanding trafficking and developing policies and responses. For example, research needs to be done in countries of destination to assess the manner in which restrictive immigration laws facilitate trafficking by preventing people from entering legally. Research is also needed on best practices regarding prevention and reintegration. (Jordan 2002: 29)

- Information and mass media campaigns should not use scare tactics to deter people from migrating. Governments should fund campaigns that provide information to potential migrants about their legal rights abroad and safe migration so that people can decide whether or not their travel and work plans are realistic and safe. The campaigns should also be linked to service providers and ways to obtain more information. (Jordan 2002: 29)

Article 10 of the UN Trafficking Protocol stipulates measures to be taken by State Parties for information exchange and training. The Article refers to multiple stakeholders who should be trained with human rights, and child and gender-sensitive perspectives for multiple stakeholders. These include policymakers, criminal justice practitioners, border and immigration authorities, labor inspectors, workers’ and employers’ organizations, health practitioners, and social workers, and other relevant officials in the prevention of TIP.

The Annotated Guide also provides guidelines on achieving the objectives stated in Article 10 above. It suggests that NGOs and law enforcement need to work together. Experience has shown that the input of NGOs is often extremely helpful in encouraging law enforcement officials to change their practices in a manner that protects the rights of trafficked persons and assists law enforcement.

Member States are faced with different challenges in preventing and combating TIP, not only because the extent and nature of the problem varies but also due to different capacities across countries and regions. For this reason, strengthening capacity through training and legal education at the national level is necessary so that countries have the institutional and technical ability to develop and implement their own anti-human trafficking policies and strategies.
The “International Framework for Action to Implement the Trafficking in Persons Protocol” (UNODC 2009) stipulates the implementation measures that countries could take especially with respect to awareness and training for the prevention of human trafficking. Such measures may include: “Identify groups and communities vulnerable to trafficking, those who may come into contact with trafficking situations and the general public, and describe their environment” (UNODC 2009: 41); “Implement awareness-raising campaigns to raise awareness among identified vulnerable groups, for instance, through free hotlines, or other accessible open sources, including information on how to obtain legal employment, migration information, the risks of trafficking in persons” (UNODC 2009: 42); “Implement awareness-raising campaigns among key/influential audience in destination communities to generate concerns and to address the demand for easily exploitable services and labor” (UNODC 2009: 42); “Monitor the impact of awareness campaigns including attitude in countries of origin, transit and destination” (UNODC 2009: 42); “Implement measures to reduce specifically the vulnerability of children through raising awareness education in schools (e.g., integration of the issue into school curricula), and creating multi-stakeholder community networks, which are able to identify potential child victims and prevent them from being trafficked” (UNODC 2009: 42); “Ensure or strengthen training of law enforcement, immigration service and other services related to prevention as well as social support and welfare service and civil society partners” (UNODC 2009: 43).

The “Framework” further prescribes that for prosecution of trafficking crimes, the implementation measures that countries could take especially with respect to awareness and training could be: “Ensure comprehensive training for law enforcement, immigration, and judicial authorities, prosecutors, labor inspectors, social workers and other relevant officials (such as, medical, psychological, and social service) in combating trafficking in persons” (UNODC 2009: 19). This training should focus on methods used in preventing trafficking, prosecuting the traffickers, and protecting the rights of the victims, including victim assistance and protection. “It should also take into account the need to consider human rights, refugee protection and child and gender-sensitive issues and it should encourage cooperation with non-governmental organizations, other relevant organizations and other elements of civil society” (UNODC 2009: 19). Training should also focus on “Anti-corruption training for law enforcement officers, judges, prosecutors, immigration officers, and judicial authorities” (UNODC 2009: 23).

An example of another relevant UN Protocol prescribing training for those who work with child victims of trafficking/crime is the Optional Protocol to the Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography (2000). This Optional Protocol mentions in Article 8, paragraph 4 that “State Parties shall take measures to ensure appropriate training, in particular legal and psychological training, for the persons who work with victims of the offences prohibited under the present Protocol.” This guideline is useful to those working with child victims of trafficking.
Countries that have signed or ratified the UN Trafficking Protocol and other UN instruments have committed themselves to implementing its various provisions, and therefore, are also obligated to implement measures with respect to public awareness and legal education of duty bearers.

**Public Awareness and Legal Education for Duty Bearers: Why and By Whom Required**

*Objectives for creating public awareness* – According to the International Labor Organisation (ILO 2014), two important reasons that push people into forced labor and trafficking are poverty and the lack of education. This ILO report highlights how forced labor thrives in the incubator of poverty and vulnerability, low levels of education and literacy, migration, and other factors. Education and literacy are very important factors, both in terms of vulnerability to, and in the elimination of, forced labor. Educated individuals are less likely to be in basic forms of manual labor and are more likely to know their rights. Literate individuals can read contracts and recognize situations that could lead to exploitation and coercion. However, the great population movements in the 1980s and the 1990s opened a “demand side” for irregular channels of migration. Thus, new international dynamics were created, making people who aspire for a better life, vulnerable to trafficking.

Similar reasons as above, could be accorded for human trafficking for any exploitative purpose, be it sexual exploitation, organ trafficking, forced or/child marriage, and others. Lack of awareness in the context of human trafficking could imply any one, or a combination of the following:

- Absence of knowledge of the *modus operandi* of the traffickers.
- Absence of knowledge on what is trafficking and its different forms, pushing people into making uninformed choices and decisions.
- When caught and trapped in the vicious cycle of abuse and exploitation, victims do not know whom to contact or how to get out of it.
- Misconceptions and myths impeding efforts to prevent trafficking. This include the supposition that only women can be its victims, whereas, men can also become victims, especially of labor trafficking or organ trafficking, often leading to men failing to identify themselves as trafficking victims.

A survey of available literature from India such as UN, NGO, and media reports on TIP confirms that not all people in India understand human trafficking, nor do they see it as a problem in their daily lives. This is despite the fact that South Asia generates the world’s second largest number of victims and India itself is a source, transit, and destination country for trafficked victims. Awareness of human trafficking was found to be low, as evidenced by a research study in India, and other countries (China, Indonesia, Japan, Philippines, and Thailand) where on an average, less than 40% of the respondents were familiar with this crime (Prawit 2011).
The one major factor that contributes to the escalating numbers of trafficking, especially in rural areas or/villages in India, is that people simply do not know about the dangers and realities of this crime. However, this absence of alertness is now no longer confined to villages. Even the urban masses, the reasonably economically secure population, and the well-educated, often have an inadequate/limited understanding of trafficking.

However, there has been no systematic and evidence-based research by any government institution or India based NGOs, towards understanding how little is known about public comprehension, perception, and attitudes of TIP in India. Thus, there is a strong need for building public awareness in India in the light of the identified shortcomings as above.

The context of public awareness – Within this discourse, there are some pertinent questions on public awareness vis-à-vis trafficking that need to be answered for designing effective plans of action. These questions are who ought to be considered as “public” and what is the “public sphere”? What exactly is public “awareness” and thereby, public “comprehension”? Does it represent collective viewpoints of a mass of people? How is it formed? What is the impact of awareness campaigns, media outreach, and other strategies on generating this public awareness? How and to what degree does public awareness leverage the fight against human trafficking?

A broad range of stakeholders would come within the ambit of “public” who would benefit from awareness and information on human trafficking. These include vulnerable communities, “supply” and “demand” areas, children and youth in educational institutions including those out of formal education systems, religious and faith-based organizations, trade unions, consumer groups, and the entire population in general.

Objectives of legal education and training of duty bearers – Some of the duty bearers are the first responders to the victims of human trafficking, such as the police, NGOs, and medical professionals. Appropriate training and capacity building of all the duty bearers sets the tone for a victim-friendly approach in all aspects of human trafficking. To take an example, throughout the world, “prosecution” of trafficking offences has been considered as a fundamental governance and law and order approach. This approach typically involves, framing of specific anti-trafficking laws, arrest and prosecution of traffickers, and investigation of the organized nature of the crime. The implementation of the legal framework is done through capacity building and training of police officials, prosecutors, judicial officers, and all other related duty bearers.

Human trafficking crimes are different from other crimes, in its modus operandi, its geographical spread often becoming transnational, its financial trails, the psychological profile of the victims and often their non-cooperation with law enforcement, traffickers often being known to the victims and their families, and the enhanced complexities when the online or/mobile phone component is added to it.

Law enforcement authorities usually face challenges of manpower and technology to combat sophisticated organized criminal networks and even lack the training required for identification of victims and comprehensive investigation of human trafficking offences. Successive UNODC and other UN agency TIP reports, and the annual report of the US government on TIP, have highlighted the uneven law enforcement responses by countries and their varying levels of readiness to combat
this crime. When first responders and all other service providers are not aware that human trafficking is occurring in their communities, victims fall through the proverbial cracks and do not receive the support they need.

While governments are primarily responsible for capacity building and training of all duty bearers, multiple international and national NGOs are equal participants, bringing forth wide-ranging expertise in the process.

The objectives of legal education and training of duty bearers is to implement the national laws more effectively so as to ensure prevention of TIP, prosecution of offenders through strengthened investigations and prosecutions, and protection of victims through a victim-centric approach.

Important aspects in countering trafficking are the creation of awareness and knowledge through training and capacity building of duty bearers, appropriate attitudinal orientation, and enhanced understanding of the true essence of the laws on human trafficking.

The proverbial duty bearers – A wide-ranging group of stakeholders are service providers or duty bearers to victims of human trafficking, who need legal and other professional resources and solutions. Some of these duty bearers would be first responders with different responsibilities. Others would provide services at different stages of a victim’s journey of removal from exploitative circumstances towards rehabilitation. Still, others would be involved in making laws, policies, and plans to fight human trafficking, such as the relevant Ministries and government Departments. These Ministries and Departments are usually those dealing with women and child, home/or interior affairs, foreign affairs, labor, education, health, social welfare, rural development, among others. Some duty bearers would be enforcing the laws and policies such as police, prosecutors, judges, lawyers, border security, immigration officials, medical service providers, NGOs, and others. Each and every duty bearer requires training and knowledge of this crime to frame adequate responses.

Reasons for the Gaps in Awareness and Legal Knowledge of Both the General Public and the Duty Bearers

What information is available on the Internet for anyone who wishes to understand/search on the topic of “human trafficking”? A cursory search will show that information, which comes up is dominated by trafficking for sexual exploitation. In many cases, the imagery features misleading and sometimes voyeuristic images of victims that are chained up or locked behind bars and wire. This messaging and imagery provide a foundation for a majority of TIP awareness campaigns. This singular emphasis too often overlooks equally devastating trafficking types, such as forced labor, domestic servitude, organ trafficking, forced marriage, child soldiers, and others.

Besides, images of chains and captivity create a false narrative and misinformation, that victims of trafficking are held only by forceful physical restraint. In reality, however, trafficking does not require physical restraint, bodily harm, or
physical force. The old myths of victims being prevented from going out alone, or being locked up in rooms, with no freedom of movement are a bit over exaggerated in today’s day and age, with psychological manipulation, being the most common method used by traffickers to manipulate victims for exploitation. Victims often develop a “Stockholm syndrome,” which is a condition that causes them to develop a psychological alliance with their perpetrators/the traffickers, as a survival strategy during exploitation (Levine and Schumacher 2017). Other forms may include “capture bonding”/“trauma bonding” with their perpetrators as a result of power imbalances and the intermittent good-bad treatment (Dutton and Painter 1993).

With regard to the training and capacity building of duty bearers, there are many factors that could explain uneven responses by them in identifying victims, conducting comprehensive investigations, guiding effective prosecutions, and providing medical and legal services. One factor is a lack of training for counter-trafficking agents in the field. Although some governments have themselves invested extensively in training and capacity building, in other cases, where governments do not have adequate financial capacity, they complement their efforts with the assistance of international and national NGOs. Capacity building of duty bearers through the creation of strong infrastructure and human resources is one part of taking action. The other significant part being training which prepares them for actual action vis-à-vis combating this crime. Both these aspects have to be strengthened for a concerted effort. And yet, economics and prioritization (or the lack thereof) in a particular country, often become the deciding factors in enhancing capacities and training the service providers.

Clarifications need to be made on the difference between training, workshops, and awareness. A workshop refers to a seminar, discussion group, or the like, that is used to exchange ideas about any particular subject. It emphasizes problem-solving, hands-on training, and requires the involvement of the participants. Training is a skill-building program that relate to specific knowledge area and competencies. Training has specific goals of improving one’s capability, capacity, performance, and productivity. “Workshop” is a subset of “training methods” along with lecture, seminar, tutorial, simulation, which are other methods of training (Training vs. Workshop 2016). Awareness on the other hand, is use of different methods to create a basic understanding of the problem among the larger target audience.

The reasons for the gaps in raising awareness can be traced to the “challenges” of raising awareness and its impact. Significant initiatives are being undertaken globally to raise and increase awareness, however, these campaigns need to be based on the changing nature and modern trends of human trafficking for greater impact. These in turn will have the prospective to be of direct and lasting benefit to all potential victims.

In the context of public awareness building and campaigns, important issues to be identified are:

- Do the campaigns create a meaningful understanding and perception for the general public about the intricacies of human trafficking and it’s interconnectedness with the social, economic, cultural, and political characteristics in which it thrives and survives?
What is the impact on public awareness from the messaging that it receives from targeted campaigns, media, and all other sources?

Is there any relationship between public awareness, participation, and action?

There is a dearth of research or information and no convincing evidence available on the impact of raising awareness, on whether the campaigns raise knowledge and understanding to any degree necessary to reduce human trafficking. The short films, posters, and other visual materials on human trafficking are typically framed in the most superficial ways. For example, a short campaign film that shows a young girl, with garish lipstick, swinging on a perch in a birdcage, being tortured by a man in preparation of prostitution (Don’t be Fooled 2011). Another shows a photo of a naked woman with a barcode on her back (Constantine 2017). Such images, therefore, too often sidestep both the complexities and the new methods of trapping and involving victims in various kinds of exploitation.

It needs no detailed research to know that the efforts in preventing human trafficking by countries of origin have proved inadequate to address the “supply side.” This is despite the collective endeavors of governments, international and national NGOs, and other stakeholders in this direction.

In addition to questions about effectiveness, we have even more troubling questions about the degree to which campaigns are actually counterproductive. For instance, the target audiences have quite often interpreted anti-trafficking materials in South Eastern Europe as anti-migration propaganda. Or that raising people’s awareness about trafficking had sometimes unintended and even counter-productive side-effects, such as provoking a fall in school attendance of girls in parts of Albania, because their parents were afraid that they might be abducted (Dottridge 2006).

Awareness campaigns are usually targeted at two core audiences, the potential victims, and the general community. With respect to specifically aiming at potential victims of trafficking, there is information material usually placed at airports, for example, at Thailand’s Suvarnabhumi airport (Yi 2018). Or at bus stations in an initiative by the Delhi (India) police through forging an alliance between police, NGOs, vendors/hawkers, at the Inter-State Bus Terminus at New Delhi (UNODC 2007: 73). In Thailand, messages to identify human trafficking are also shown in shopping malls, cinemas, and train stations across its capital Bangkok. These show people how to look out for signs of human trafficking (Yi 2018).

In as much as these campaigns and strategies are laudatory, there is very scant empirical statistics to show that these Public Service Announcements (PSAs) are effective approaches for a victim or potential victim to access help. The organizations creating these campaigns typically assert that they are successful, but as long as the evidential back-up data does not exist, there is no sure way of verifying that these were indeed effective in preventing trafficking or in providing critical information for accessing help to a victim.

Apart from creating awareness aimed at potential victims, campaigns trying to inform and alert the general public is even more challenging. Numerous national and international NGOs spend vast sums of money to produce and distribute PSAs. Again there is negligible empirical data to back up this strategy and to validate its effectiveness.
Both types of campaigns do not focus on all types of trafficking. This is, therefore, a missed opportunity to inform migrant laborers, domestic workers, child laborers, and others of the illegality of the acts and the risks of unscrupulous labor recruiters and entrapment through debt.

Above all, the biggest challenge is that there is weak co-operation between countries in documenting and sharing experience about the effectiveness of anti-trafficking campaigns, which is perhaps why prevention strategies have failed to integrate into policies, both globally and in India.

Current Government and Nongovernment Initiatives in India Towards Legal and Public Education on Human Trafficking

The magnitude of human trafficking in India; the size of the population; the religious, social, cultural, and linguistic diversity of its people; the lack of adequate economic opportunities; and other factors creating vulnerabilities for trafficking make it difficult to have one composite public awareness campaign. There is no known major public awareness campaign run by the federal government on human trafficking. However, state governments have their own initiatives on the subject. Some of the initiatives on building public awareness, and training and capacity building of duty bearers, undertaken by the federal and State governments and, NGOs are highlighted as underneath.

Child trafficking and missing children – A large number of children go missing each year in India, and it is believed that most of the missing children are trafficked for various purposes (Sen and Nair 2004: 207; Supreme Court 2013). They could also be runaways from home, or simply be lost, making them vulnerable to trafficking and exploitation. It is thus important to recognize the vital link between missing and trafficked children.

A court judgment (Bachpan Bachao Andolan v/s Union of India of High Court of Delhi 2011) highlighted that of the 44,000 children that are reported missing annually, only 11,000 are traced. In 2013, the highest court of India directed (Bachpan Bachao Andolan v/s Union of India of Supreme Court 2013) that in case a missing child is not recovered within 4 months from the date of filing of the First Information Report, the matter may be forwarded to the Anti-Human Trafficking Unit (AHTU) in each State, to enable the said Unit to take up more intensive investigation regarding the missing child.

To deal with the issue of missing children who may have been or who could potentially be trafficked, the Government of India has set up two official web portals to register missing children. The Ministry of Women and Child Development (MWCD) has developed web portals “TrackChild” and “Khoya-Paya” (literally, lost and found) to track the missing and found children. The TrackChild portal is implemented in association with various stakeholders including Ministry of Home Affairs, Ministry of Railways, State Governments, Child Welfare Committees, Juvenile Justice Boards, National Legal Services Authority. The Khoya-Paya has been integrated as a citizen corner on the TrackChild portal.
The “Khoya-Paya” is a citizen-based website to exchange information on missing and found children. This works as an enabling platform, where any citizen of India can register and report about missing children, sightings of their whereabouts, and “found” children previously reported missing. This portal allows the public to create a missing or found child report, which can be viewed by other users. This is to enable parents looking for their children to get in touch with members of the public who report sighting these children.

The “TrackChild” portal is a limited portal since it allows only police to police communication, whereas everybody can participate in the Khoya-Paya portal. This enables a citizen to citizen contact and allows private citizens to take part in search for missing children.

The number of website hits reported on TrackChild portal from January 1, 2012, to December 28, 2017, are 139,443,896. The number of children missing during this period were 280,561 and those tracked/rescued with the help of these portals are 202,877 (Press Information Bureau 2018).

The MWCD also provides support for an outreach service for children in distress, through a dedicated toll free Childline number, 10-9-8. This number can be accessed by children in crisis or by adults on their behalf from any place in the geographical location of India. Information on this toll free number is widely available everywhere in India and is among one of the more successful initiatives and partnership between the government and civil society.

Training and capacity building – The Ministry of Home Affairs (MHA), Government of India, through the Bureau of Police Research and Development, Central Bureau of Investigation, and the National Police Academy conducts regular TIP training programs for police. State Police Academies and Judicial Training Academies of various States, including the National Judicial Academy, hold regular training programs. The border security forces like Central Reserve Police Force and the Sashastra Seema Bal (literally, Armed Border Force) are also trained to prevent and detect human trafficking cases at the border areas of Bangladesh and Nepal. These training programs often involve NGOs working on anti-human trafficking and thus follow a multistakeholder and multidisciplinary approach in the selection of trainers and trainees.

To provide just one instance of the impact of training, the number of traffickers apprehended by the Sashastra Seema Bal has risen from just 8 in 2014 to 102 in 2015, 148 in 2016, and 154 in 2017 (Weinert and Weinert 2018).

Anti-Human Trafficking Units (AHTUs) – The MHA is implementing a comprehensive scheme to strengthen law enforcement capability, by setting-up about 350 AHTUs (by the federal and the state governments), throughout the country and impart training to 10,000 police officers through Training of Trainers (TOTs), who in turn would train more police officials in their respective states. However, assessing the impact of the training programs as well as the efficacy of AHTUs has not yet been undertaken through proper monitoring and evaluation.

Academic courses – The Indira Gandhi National Open University, in partnership with the MHA (Press Information Bureau 2010) offers a certificate course on TIP, to accelerate the process of sensitization, awareness and training of law enforcement
officials and other stakeholders like prosecutors, government departments, and NGOs. The course is available for a minimum period of 6 months and maximum duration of 2 years. This certificate course is a part of the ministry’s efforts on training and competence building on human trafficking.

Initiatives by NGOs – In the recent past, two major initiatives have been taken by NGOs in multiple states to create and channelize public awareness on human trafficking.

Bharat Yatra – Nobel Peace Laureate Mr. Kailash Satyarthi conducted a 36 days Bharat Yatra (India March 2017), an 11,000 km road rally, in September–October 2017, as a clarion call to “Make India Safe Again for Children,” against all kinds of sexual abuse and exploitation, and especially child trafficking. The Yatra was led by the Kailash Satyarthi Children’s Foundation and was conceptualized on the theme of Surakshit Bachpan–Surakshit Bharat (literally, Safe Childhood – Safe India).

It started from the southernmost tip of India in September 2017 and culminated in north India, through seven different routes touching cities, towns, and villages in 22 Indian states and Union Territories, engaging with policy makers, implementers, teachers, local leaders, women’s groups, law enforcement personnel, the media, business leaders, and most importantly with children and their parents. Using the traditional and time-tested technique of social mobilization by walking and connecting interpersonally on the streets and in small lanes, the Yatra included gathering for events and awareness programs and leveraging political leadership to mobilize action, through partnering with several local civil society organizations (India March 2017).

A special feature of the march was the involvement of child abuse survivors, universities, schools, religious leaders, local community radio stations, along with local NGOs. Political heads of several States committed themselves to protection of children against all kinds of abuse in their States. A total number of 1,011,323 pledges were taken by children, women and men towards making India safe for children (India March 2017).

The impact of the Yatra was given in its scale of reach and mobilization – it had 1 billion online imprints; millions of students reached in 25 states with a lesson on child safety from sexual abuse; 2 million views in 24 h of the theme song recorded by a popular band and rescued child laborers, promoted by Google India; 1.4 million+ pledges to make India, their state, their town safe for children; 800,000+ participants including movie stars, corporates, political leaders, and others; 250,000 educational institutions engaged; 11,000 km covered in 35 days; 5000+ civil society partners involved; and 29 religious leaders publicly pledged their support (India March 2017).

Swaraksha (self-protection) – a Community Based Prevention Programme of Prajwala (Swaraksha 2016), an NGO from southern India, recognizes that the crime of human trafficking can be stopped only through the concerted efforts of all stakeholders, including the general public. It was conceptualized and launched by Prajwala in January 2016, in collaboration with three state governments (Telangana, Andhra Pradesh, and Odisha) to spread awareness among the communities against trafficking for commercial sexual exploitation.
A caravan travelled through villages, towns, and cities, demonstrating a unique partnership between local civil society partners and several state government departments, such as Department of Women and Child Welfare, Department of Home, heads of district administration, district police, senior judiciary, State Legal Services Authority, experts on trafficking and survivors of sex trafficking.

The caravan travelled 14,000 km, covering all the districts of the three states in 165 days and its impact was:

- Directly interacted and impacted 1 million students, girls, women, and men
- 112 suspected cases of trafficking were reported from within the community
- 40 trafficking offenders disclosed their crime in public and repented their actions
- 1990 community members came forward as members of community vigilance (Swaraksha 2016)

The target beneficiaries of the Swaraksha campaign were young and vulnerable girls from underprivileged backgrounds in schools, and villages with small populations. In addition, young men in schools and colleges, auto rickshaw (a mechanized transport, which runs on three wheels) unions, truck drivers associations, and men’s clubs were approached as equal stakeholders to generate support from them to curb the “demand” for paid sex.

The sustainability of this community outreach and awareness program was made possible by the State of Telangana, which has prescribed every third Saturday as anti-trafficking day in the state, to promote awareness on the subject. Seeing the outreach and success of the program, the caravan is proposed to be replicated in 7 countries and in rest of the 26 states of India (Swaraksha 2016).

**Businesses fight human trafficking** – There are many instances in India of businesses collaborating with NGOs to create public awareness on trafficking. To quote one such example, E-commerce platform Snapdeal has partnered with NGO Save The Children in July 2018, to raise awareness about the problem of child trafficking in India. The campaign, titled #KidsNotForSale, features a teaser campaign portraying an “Amazing Kids Sale” on Snapdeal that highlights stories of children who are sold for prostitution, kidnapped at birth, made to work in unhealthy conditions, drugged for organ trafficking, or forced to become combatants (Save the Children 2018).

**Illustrated comics** – Illustrated comics is an example of innovative technique being used by NGOs in directly empowering children with the knowledge of human trafficking (Pasricha 2017). In January 2017, thousands of school children in India’s northeastern state of Assam pored over an illustrated story of how two young girls from a relief camp were lured by a man who told them of the good life they could lead in a big city. It sounded attractive to the poor youngsters who could only visualize a bleak life ahead. Fortunately spotted by a policeman as they waited for the man at a railway station to head to the city, the story goes on to relate what their future could have been like when they were sold to work as poorly paid domestic employees, sex workers, or laborers.
The comic in the local Assamese language aims to raise awareness among children about trafficking rings that lure young girls and boys from villages into India’s big metropolitan cities with the promise of good jobs. As child rights campaigners’ stress, prevention as key to addressing the problem, comic books have emerged as an effective tool to empower children to protect themselves (Pasricha 2017).

**Recommendations for Curtailing Human Trafficking Through Public Awareness and Legal Education of Duty Bearers**

Social media campaigns raise awareness by spreading information and allowing for small, manageable goals to be set. Since large majority of the rural population as well as the urban city dwellers in India are unaware of the prevalence of human trafficking and how traffickers lure their victims into exploitation, implementing a social awareness campaign could increase understanding of the dangers of human trafficking and potentially dramatically reduce incidences of human trafficking.

However, for any campaign to be effective, it should be based on sound research with some indicators towards impact measurement. Therefore, to build evidence-based awareness and training:

- More research and information is required on the efficacy of the awareness campaigns.
- Whether public service announcements, information campaigns, or celebrities talking about the plight of exploited victims is making a measurable impact.
- Playing the numbers game (the use or manipulation of statistics or figures, especially in support of an argument), as donors have sometimes been known to do, is not helpful.
- Can the awareness raising messages include more stories and information on prosecution of traffickers/offenders, the legal framework on human trafficking, and the agencies responsible for its enforcement.
- Campaigns and their interconnectedness with the social, economic, cultural, and political characteristics in which trafficking thrives and survives.
- Reaching a million viewers who do nothing to help fight trafficking, and may even undermine the cause by understanding the problem too superficially, is less valuable than helping a handful of people to avoid being trafficked or to access support after it has taken place.

Social campaigns should utilize simple and fairly familiar methods of communication to engage their target audience. Campaigns should tap into already existing communication framework and need not be too cost-intensive. Effective use of local language media channels could be made to engage communities. Campaigns should not have unrealistic and lofty goals, while focusing on core specific messages.

However, awareness-raising campaigns should not be very general in content and nature. Rather, it should provide people with specific information on what to look for
so they could detect trafficking in their vicinity. Vulnerable communities should be given information on predatory behavior and tactics of traffickers, especially their use of technology in the digital age. Awareness campaigns should also be approached holistically, involving all segments of society, and should definitely aim at reducing the stigma associated with the issue, bringing in a cultural change and breaking the “conspiracy of silence.” All stakeholders involved in creating public awareness should make extensive use of social media and all online platforms as young children and youth are more comfortable accessing information there.

Before the awareness campaign is launched, it would be prudent to have some sort of community readiness assessment to ensure proper results/action as an impact of the awareness campaigns. Law enforcement, other government authorities, NGOs, community-based organizations, welfare services, and all other relevant stakeholders must be prepared for the potential impact of educating people on this subject. Efforts needed for community readiness will vary depending on the community infrastructure in place to respond to human trafficking, such as hotlines/helplines to report cases or suspicious activities, law enforcement readiness, government and NGO run shelter homes to house victims immediately upon removal from exploitative circumstances, and other preparatory steps.

**Use of Internet/mobile phones for communicating TIP messages** – The number of Internet users in India was expected to reach 500 million by June 2018, as reported by the Internet and Mobile Association of India (Agarwal 2018). The number of mobile phone users in India in 2018 was expected to be 775.5 million (Statistics Portal 2018a). As per information received from an anti-trafficking NGO, traffickers sent about 80,000 SMSs in 2017, in a certain geographic region of a state in India, offering jobs in big cities, and were able to traffic about 1800 of those who responded to the job advertisements. It thus seems that traffickers are using mobile phones more effectively to reach out to potential victims from vulnerable populations in comparison to government and other stakeholders, which could also use the same medium to convey awareness messages to the people on trafficking.

**Social media and messages on TIP** – With respect to social media, India claimed the first place with 294 million Facebook users as of October 2018 (Statistics Portal 2018b). India is also the largest market for WhatsApp with over 200 million monthly active users as of February 2017 (Statistics Portal 2018c). Such platforms and Apps could be used extremely effectively to convey messages on TIP to a very large population at almost negligible financial costs.

**Television and public awareness** – Indian media and entertainment industry is estimated to touch US$ 37.55 billion by 2021 from US$ 22.75 billion in 2017 (IBEF 2018). Television dramas called “serials” (another name for soap operas) in India are the dominant form of television entertainment in urban and rural India. Indians are watching TV for 3 hours and 44 minutes on average every day as per the Broadcast India 2018 survey undertaken by the Broadcast Audience Research Council of India (Laghate 2018).

Without going into the artistic merit and quality of these soap operas, they continuously try to introduce new contemporary content, such as child marriage and others. The information provided disseminates relatively quickly and across a
broad range of audiences and has a great deal of influence on the lives of people who are avid followers of these stories telecast every day. Using soap operas as a platform to convey human trafficking related messages would instantly convey the information in people’s homes very effectively.

*Films for public awareness* – The Indian film industry’s’ gross box office earning in 2017 was USD 2.2 billion, with over 9000 single screens and 2100 multiscreens as of 2016 (Cinema of India 2018). Films as a means of communicating human trafficking messages either as full-length films or through messages conveyed in theatres is a very powerful medium of information sharing. Among the very popular films recently made on human trafficking stories in Hindi and in other regional languages are *Mardaani* (2014), *Love Sonia* (2018), *Lakshmi* (2014), *Naa Bangaru Talli* (2013), *Aanmai Thavarael* (2011), *Siddharth* (2013), and others.

Indian NGOs also make films on trafficking and release them on You Tube reaching wider audiences as part of their own communication and advocacy. Most of these movies effectively portray the intricacies and multilayered realities of human trafficking by depicting the life of a victim from the minute they are captured until they are able to escape, and their journey towards healing and rehabilitation.

Efforts by government and all other stakeholders should extend beyond raising awareness campaigns to strengthening anti-trafficking laws and the law enforcement and strengthening partnerships between governments, law enforcement, and non-governmental organizations. Successive TIP Reports from the US Department of State and Indian NGOs have highlighted that in far too many cases trafficking laws are applied unevenly. The same reports highlight that criminal justice practitioners lack adequate training, thereby failing to identify victims initially, hampering effective justice delivery to them.

There is thus no substitute for consistent legal knowledge and capacity building of the duty bearers and public involvement as the *sine qua non* in the fight against human trafficking.

Abstract

Human trafficking concerns the private sector. Both sex and labor trafficking have been identified in legitimate businesses, and research has begun to show how a range of other businesses are wittingly or unwittingly facilitating the crime. Research can be further sparked by a clear theoretical framework that systematically addresses how and why the private sector is involved in human trafficking. This chapter examines the merits of three existing theoretical frameworks in guiding empirical research on the role of the private sector in human trafficking. These frameworks include theoretical notions on organized crime, corporate

Introduction

Since the passing of the United Nations Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children (UN Palermo Protocol) in 2000, human trafficking has been prioritized as a serious form of crime on most governmental agendas. In supplementing the UN Convention against Transnational Organized Crime, the UN Palermo Protocol globally couched human trafficking as an organized crime that undermines legitimate economies, threatens governmental sovereignty, and has profits similar to those from drug smuggling and illicit arm transfers (Charnysh et al. 2015). This organized crime frame has been translated into various domestic policies. For example, the federal anti-trafficking law in the United States frames human trafficking explicitly as an organized crime: “Trafficking in persons is increasingly perpetrated by organized, sophisticated criminal enterprises. Such trafficking is the fastest growing source of profits for organized criminal enterprises worldwide” (Trafficking in Victims Protection Act, TVPA Sec 102(b)(8)). More broadly, studies have shown that on international level, the problem of human trafficking is defined through the lens of organized crime and criminal networks that are undermining state authority (Broad 2015; Charnysh et al. 2015; Simmons and Lloyd 2010).

The focus on organized crime perpetuated by political elites and codified in legislation resonates in media (Charnysh et al. 2015; Farrell and Fahy 2009; Johnston et al. 2015). News outlets commonly describe human trafficking as “the fastest growing business of organized crime” (in Farrell and Fahy 2009) and report on the “sophisticated international slave trade syndicate[s]” (Hosken and Masweeneng 2018) and criminal networks “suspected of conspiracy to rape, sexual exploitation, trafficking, blackmail and drugs offences” (Dearden 2018). Such crime narratives incite public fear about human trafficking and point to nefarious perpetrators creating a problem that needs to be solved by criminal justice professionals (Charnysh et al. 2015; Farrell and Fahy 2009; Jahic and Finckenauer 2005).

While supporting the intensification of criminal justice responses to human trafficking, the crime narrative diverts attention away from more complex issues underlying human trafficking such as poverty and inequality (Farrell and Fahy 2009) as well as a complex nesting of human trafficking practices in legitimate surroundings and economic systems. With human trafficking, as seen in the criminalization of...
other social problems (see, e.g., Hagan 2010; Simon 2009), there is a failure in research and public policy to address private-sector responsibility.

Nonetheless, scholars and practitioners have recently begun to recognize how human trafficking occurs in legitimate businesses and otherwise intersects with the private sector through supply chains, logistics, or finance (see Chap. 48, “Human Trafficking in Supply Chains and the Way Forward” by Lloyd). These studies call upon the private sector to play a more prominent role in anti-trafficking efforts (Aronowitz et al. 2010; Shelley 2010; Shelley and Bain 2015). Even so, empirical research on how the private sector drives or facilitates human trafficking remains in its infancy in part because there is no clear theoretical framework that can guide scholarship in this area.

To fill this gap in the literature, the current chapter discusses three theoretical frameworks that can guide research on the role of the private sector in human trafficking. First, theoretical notions associated with an organized crime frame include a role of legitimate businesses facing infiltrative practices of traffickers. Second, a corporate crime frame provides several theoretical explanations for why private individuals and businesses may engage in human trafficking but is limited in explaining the involvement of other businesses unwittingly facilitating the crime. Third, a network frame can illuminate the economic and social ties that connect a broad range of legitimate businesses to human trafficking practices and may more effectively describe the complex character of private-sector involvement. In highlighting the merits and pitfalls of each of these frameworks, this chapter aims to provide theoretical counter-narratives to the dominating framework through which human trafficking is understood and which has left little consideration of the role of the private sector in human trafficking.

The next section will elaborate on prior research that has discussed the role of the private sector in human trafficking, followed by a section that outlines how the three theoretical frameworks help us understand the role of the private sector in human trafficking. A subsequent section utilizes these frameworks to call upon the role of the private sector in anti-trafficking responses, and a concluding section proposes future directions for research and policy.

**Evidence on Private-Sector Involvement**

Recent studies have begun to refer to human trafficking as a crime problem that concerns the private sector (e.g., Bales 2004; Crane 2013; Jägers and Rijken 2014; Shelley and Bain 2015; Todres 2012), and a small number of private individuals and businesses have faced legal charges because of their purposeful and strategic role in the recruitment and exploitation of cheap or abundant human labor or sexual services (e.g., De Vries, 2018). As a matter of definitional clarity, it should be noted that while the purpose of exploitation is a key defining feature of both sex and labor trafficking, exploitation can also occur outside of a trafficking scheme due to other circumstances that increases vulnerability to exploitation (see, for an in-depth discussion of the difference between human trafficking and exploitation, Campana and Varese...
Examples of companies facing criminal charges for activities related to labor trafficking and exploitation were included in USA v. Askarkhodjaev et al. (USA v. Askarkhodjaev, et al. 2010), which involved three labor-leasing companies facing charges for racketeering, bringing in and harboring aliens, and money laundering and fraud as part of a grand labor trafficking and exploitation scheme of migrant workers in construction and hospitality venues across the USA. While the charges against the corporate entities were dismissed, the defendants running these businesses were convicted for labor trafficking-related activities. In addition to the businesses facing legal procedures, other businesses had a facilitating role in securing fraudulent contracts for employment in construction, hospitality, and housekeeping services. Companies faced more often legal persecutions for labor trafficking or situations alike under the civil law in the USA, for example, in Baricuatro et al. v. Industrial Personnel and Management Services, Inc. et al. (2014), Chellen et al. v. John Pickle Company et al. (2006), or Francisco et al. v. Wiley (2013) (see, for other examples, De Vries 2018). The case law database of the United Nations Office on Drugs and Crime (UNODC n.d.) can be utilized to search for examples of individuals running legitimate businesses for trafficking purposes in different countries. For example, in a case in New Zealand, a defendant’s wife ran a legitimate travel agency to transfer immigrants to New Zealand under false or misleading information for the purpose of labor exploitation at various businesses (The Queen v. Faroz Ali and Jafar Kurisi 2015).

In addition to defendants running businesses for the purpose of labor trafficking, existing studies provide numerous examples of traffickers running bars, restaurants, or sham escort services as a cover for sex trafficking, evade law enforcement detection, to recruit clients or to claim ignorance (see Bouché 2017; Shelley 2010). Research has also begun to draw attention to massage businesses involved in sex and labor trafficking practices, with a number of businesses operating under the guise of a license and advertising in newspapers, directories, and online classifieds (Polaris 2018).

Whereas legitimate businesses are used as a means to cover or launder proceeds from sex trafficking operations, corporate misbehavior in the context of labor trafficking can be a response to structural economic problems, such as rapid social and economic change, growing markets, and increased competition due to the advancement of globalization (Bales 2004, 2016; Zhang et al. 2014). In attempts to meet the demand for production and increased profitability, companies are looking for a way to get ahead of their competitors, sometimes with labor conditions falling victim to economic pressures (Brown et al. 2004; Crane 2013; Scherer and Palazzo 2011). A failure to institutionalize labor conditions in compliance with laws and regulations was taken at the core of a study by Crane (2013) who sought to explain the occurrence of labor trafficking and exploitation in failing strategic management practices such as a lack of enforcement of codes of conduct, lack of research into subsidiaries and indirect suppliers, or lack of training of employees. Crane (2013) further suggests that some businesses have difficulty meeting the legal standards due to an underpricing of labor to compete on the market, debt management, high labor
intensity, or high elasticity of demand. As a result, companies may actively engage in labor trafficking or exploitation as a means to compete on the market.

Studies have also mentioned companies where human trafficking and exploitation slips under the radar due to an unfamiliarity with laws and regulations or inability to recognize indicators of sex or labor trafficking. For example, hotels and restaurants are being utilized by traffickers to sustain their illegal operations and infrastructure without clear indication of active facilitation by these industries (Bouché 2017; Shelley 2010). Studies also warn against growing corporate networks in which single companies have difficulty monitoring the institutional and management practices of subcontractors or other collaborators such as suppliers and manufacturers culpable for substandard labor conditions (Aaronson and Higham 2013; McSween 2011). One should further consider the corporate agencies behind social media websites utilized for sex trafficking operations: Research increasingly shows that popular social media platforms like Twitter and Facebook are utilized by traffickers as a convenient medium to recruit young women and girls and offer their sexual services (Latonero 2011).

Furthermore, some companies may knowingly accept a potential participation in sex or labor trafficking practices but do not consider their business to be a first point of responsibility (Shelley and Bain 2015) in part because of fear for reputation damage or unwillingness to implement an expensive or time-consuming monitoring system to identify instances of human trafficking (Pierce 2010). Various other companies turn a blind eye because they indirectly profit from the crime, for example, nightclubs, transportation companies, tour agencies, and the entertainment and leisure industry profiting from exploitative labor and sexual services (Leman and Janssens 2015; Shelley 2010).

Despite increased awareness about the role of the private sector in human trafficking, the amount of empirical research systematically exploring and explaining that role is limited. A recent study by de Vries (2018) sought to address that gap and analyzed US federal cases concerning labor trafficking and proposed a typology of private-sector involvement in labor trafficking. Guided by a social and economic network approach, the analyses resulted in the identification of “corporate defendants,” “active contributors,” “passive participants,” and “involuntary participants.” Table 1 summarizes the key characteristics of each of these roles. Corporate

**Theoretical Frames**

This section discusses three theoretical perspectives that may serve as an analytical tool to examine the role of the private sector in human trafficking: (1) an organized crime frame, (2) a corporate crime frame, and (3) a social and economic network frame.

**Infiltrating Legitimate Businesses: An Organized Crime Frame**

Although definitions of organized crime are controversial and ambiguous, organized crime has been defined as involving criminal networks with a restricted membership that utilize violence and threat of violence to engage in illicit activities and may or may not have a well-structured hierarchy (Finckenauer 2005; Maltz 1985, 1994). In public discourse, organized crime is often associated with a range of crime activities “that operate beneath the radar of government tax collection agencies or law enforcement” (McCarthy 2011: 26). These popular connotations are also translated into public depictions of human trafficking, which is then understood as an underground business that operates independent of legitimate markets.

Although human trafficking discourse has only recently begun to include a facilitating role of the private sector in the crime, the infiltration of legitimate businesses is often understood as a defining attribute of organized crime. Criminal infiltrative practices can be a means to conceal criminal behavior, launder money or maximize profit (Dugato et al. 2015; Gambetta and Reuter 1995; Reuter 1985), or with the aim to control certain industries, maintain family assets, cultural practices, or pursue personal reasons (e.g., Riccardi 2014). The literature on organized crime seems to agree on a somewhat opportunistic notion of private-sector involvement:
The infiltration of organized crime in legitimate businesses occurs when it is required to support the underlying criminal operation.

Studies on human trafficking that consider the role of the private sector often do so along the lines of an organized crime frame. By way of illustration, Shelley’s work highlights the organized crime character of human trafficking while emphasizing the intersections of the crime with the legitimate market (2010; Shelley and Lee 2007). Traffickers rely on the assistance of criminal and noncriminal actors in the legitimate world, for example, to obtain false documents, to organize transportation within and across borders, and to establish money-laundering channels (Shelley 2010). As an example, Shelley refers to violent Balkan crime groups that frequently seek contact with transport companies to move women to Western Europe and utilize legitimate financial institutions to wire repatriate assets (Leman and Janssens 2015; Shelley 2010). Other scholars, too, have recurrently argued how human traffickers connect with a larger world of transnational crime that infiltrates into legitimate economies to move proceeds through money-laundering channels (e.g., Shelley 2010).

Another common notion in the literature is that organized criminals are essentially entrepreneurs that somewhat formally operate as part of a criminal network: an illegal enterprise (Chambliss 1978; Smith 1971, 1980). Similarly, many scholars have depicted human traffickers as organized criminals with a business mind, arguing that their modus operandi mirrors effective business strategies of large-scale companies in the legitimate world. The difference between legitimate companies and a human trafficking operation is that force, fraud, and coercion are the key business strategy of human traffickers (Leman and Janssens 2015; Shelley 2010). The framing of human trafficking as a big business comports with public perceptions that human trafficking is the “fastest growing business of organized crime” that is “challenging trafficking in drugs as the world’s biggest illegal business” (Fight human contraband 2000, p. A14; in Farrell and Fahy 2009: 622).

While the organized crime frame draws attention to traffickers’ infiltration into legitimate businesses, it leaves little room for alternative roles of private individuals and businesses. In addition, empirical evidence suggests that various human trafficking operations are less organized and involve actors that are loosely coupled or even operate individually (e.g., pimps) (Aronowitz 2009; Bouché 2017), thus supporting the need to examine private-sector involvement in other types of trafficking operations.

**Crime in the Workplace: A Corporate Crime Frame**

Contrary to the popular depiction of human trafficking, many trafficking practices across the world occur within the context of legitimate businesses. As studies have begun to elucidate, trafficked persons can be employed in legitimate industries such as the agriculture, construction, hospitality, transportation, or venues that are licensed to offer sexual services, and there are many points of contact with a range of other businesses through supply chains, logistics, and finance (Aronowitz et al.
Within a corporate setting, both sex and labor trafficking can yield significant profits when businesses compete on the market through profiting from sexual demand, cheap labor, or tax avoidance.

Criminology has a long-standing interest in theorizing and analyzing the behavior of corporate offenders, starting with the foundational work of Sutherland (1940; Sutherland and Cressey 1947). In what became known as his differential association theory (see Bruinsma 2014), Sutherland argued that individuals in a corporate context are more likely to engage in illicit activity when they are excessively exposed to wrongdoing such as tax avoidance by others. Even though scholars have criticized Sutherland’s focus on elite corporate crime and coined terms like organizational crime to account for illicit behavior in any type of corporate setting (Schrager and Short 1978), corporate crime has now been an integral part of the work of many researchers and scholars.

Studies have proposed a variety of theoretical angles to explain corporate crime, including strain and anomie (Passas 2000), rational choice (Paternoster and Simpson 1993), neutralization techniques (Piquero et al. 2005), or control theory (Benson and Moore 1992; Piquero and Piquero 2006; Simpson 2002). Many of these theoretical notions can also help explain the behavior of corporate offenders engaging in human trafficking. For example, prior work on human trafficking has mentioned globalization, neoliberal processes, and the advancement of a global desire industry as key underlying mechanisms for why individuals and organizations, including private actors, engage in sex or labor trafficking practices to mitigate the strains they experience due to increased sexual demand or demand for cheap products (Agathangelou 2004; Crane 2013).

Potentially most applicable is a theory by Piquero and Piquero (2006) that suggests that individuals with more surpluses are more likely to have an intention to exploit. This can include managers who have “an excess of control exercised relative to control experienced” (Piquero and Piquero 2006). Even though Piquero and Piquero (2006) focused on the issue of fraud in a corporate context, their theorization helps explain why crime opportunities may more likely exist in hierarchically organized corporate settings. The unequal power structures in such settings make that managers exercise more control relative to control they experience. In the context of labor trafficking, this could be a crew boss in agriculture who is in charge in the fields and works with significant discretion in the exploitation of workers.

In addition to human trafficking practices that directly occur in a corporate context, there are various examples of human trafficking cases in which individuals utilize their professional background to neutralize their intention to exploit labor or sexual services. As noted in criminological work, individuals may be more likely to engage in crime when excessive exposure to wrongdoing helps them justify their own illicit behavior (Sykes and Matza 1957). These neutralizations of wrongdoing have been utilized to explain corporate crime (Piquero et al. 2005; Shover and Bryant 1993) and have also been suggested in the context of exploitative employment of domestic workers by representatives of international companies or by
diplomatic personnel who perceive substandard hiring and employment conditions for domestic workers as common practice within their professional setting even though the exploitation itself occurs in a more private setting of the household (OSCE 2014; U.S. Department of State 2016).

It follows from the above that the theoretical notions associated with a corporate crime frame help explain a different type of private-sector involvement in human trafficking schemes than an organized crime frame. Nevertheless, a corporate crime frame is limited in that it emphasizes crimes emerging within corporate settings rather than resulting from a broader market involvement that provides the structure for trafficking to occur. To address this gap, the next section discusses how social and economic network concepts can supplement the previous analytical frameworks to address the role of the private sector in a more comprehensive way.

**Crime in Legitimate Markets: A Network Frame**

Situating human trafficking within a broader market structure requires a relational approach that examines the social and economic networks underlying crime. A social or economic network is a bounded set or sets of individuals, organizations, or any other actors upon which relationships can be defined (Jackson 2010; Wasserman and Faust 1994). Social network analysis is an analytical technique to study these relationships. Whereas these techniques are making headway in criminology to understand the structure and organization of criminal networks (Carrington 2014), most studies are limited to the study of networks in which all individuals are labeled criminals.

A few recent studies have employed social network techniques to study the interconnectivity between legitimate surroundings and crimes such as gang activities and behavior of violent youth. For example, a study by Papachristos and Smith (2014) shows that criminal networks are comprised of offenders that navigate through multiple social worlds, resulting in systematic connections between criminal and noncriminal networks. Other studies have also demonstrated that organized crime is in part driven by connections spanning personal, criminal, and legitimate social networks (Malm et al. 2010; Smith and Papachristos 2016).

The present chapter argues that network concepts and analysis are particularly insightful to observe and explain private-sector involvement in human trafficking. Four network concepts illustrate why (see also De Vries 2018). First, multiplex ties of traffickers, referring to relationships that build on different types of relationships that may or may not be criminal (Kadushin 2012), can account for criminal connections that span personal, criminal, and legitimate social networks (see Malm et al. 2010; Smith and Papachristos 2016). Such intersections between crime and legitimate markets have been observed in the context of labor trafficking whereby traffickers navigate through supply chains, logistics, and finance (Aronowitz et al. 2010; Shelley 2010; Shelley and Bain 2015; see also ▶ Chaps. 48, “Human Trafficking in Supply Chains and the Way Forward” by Lloyd and ▶ 23, “The Spoiled Supply Chain of Child Labor” by Sadler Lawrence). When considering multiplex
ties of traffickers, private-sector involvement can in part be driven by familial, friendship, or employment ties that connect private individuals and businesses to human trafficking operations.

Second, these multiplex ties can also indicate a systematic nesting of crime within legitimate surroundings, which is better captured by the term “embeddedness.” While initially introduced by Granovetter (1985) to describe how economic behavior is constrained by social relations, the term embeddedness is now utilized to refer more generally to the nesting of individuals in larger social contexts, structures, and cultural frames (Baker and Faulkner 2009; Feld 1997; Granovetter 1985; Moody 2005; Moody and White 2003; Uzzi 1996). The multiple and overlapping social and economic networks of offenders as well as associated victims and clients/consumers suggest that there can be an inevitable embeddedness of crime in legitimate surroundings.

Third, a process of information diffusion captures the idea that market-based connections and social connections of defendants allow for the diffusion of information about crime (see for the use of this term: Hirshleifer 1973; Jackson 2010). Information about indicators of sex and labor trafficking, such as suspicious cash transactions, cheap labor, or knowledge about hazardous working conditions of employees, can travel from firm to firm through economic and social interactions if not through media exposure. The previously mentioned study by De Vries (2018) qualitatively examined information diffusion in private-sector involvement in labor trafficking in the USA and demonstrated that a broad range of firms were exposed to indicators of labor trafficking and exploitation, making them witting participants in the crime.

Fourth, information about illicit activities likely diffuses unequally through markets making some but not all firms aware of potential human trafficking practices. This results in information asymmetries, which are understood as imperfections in knowledge due to differential exposure to information about market parameters (Arrow 1968, 1974; Stiglitz 2000). Information asymmetries can explain why some companies continue to collaborate with trafficking-involved companies to gain a better understanding of the motivations behind business strategies of other companies. Alternatively, companies may also discontinue the business relationships out of fear of potential reputational or legal risks associated with the detection of crime, if not because of moral considerations (Jackson 2010; Kirman 2001; Podolny 1994). In addition to labor trafficking, the concepts of information diffusion and asymmetry can also help identify and explain private-sector involvement in sex trafficking whereby businesses such as massage establishments, hotels, and restaurants may be exposed to sex trafficking indicators (e.g., many different clients walking in and out hotels) and become witting participants in the crime when these indicators are recognized (see also the previous section).

Whereas the above concepts form by no means an exhaustive list, they are illustrative of how a relational orientation can alert scholars and practitioners to consider a trafficker’s wider social and economic network, which includes businesses that directly or indirectly and wittingly or unwittingly participate in the crime. As will follow from the next section, this broader market involvement in human trafficking demands a comprehensive anti-trafficking approach that involves legitimate businesses in anti-trafficking efforts.
Private-Sector Responses to Human Trafficking

As studies have begun to expose the limitations of the traditional response that heavily relies on the criminal justice system, legitimate businesses are increasingly called upon to identify, prevent, and combat human trafficking. This section explains why.

The Limitations of the Criminal Justice System

Human trafficking has been prioritized by the criminal justice system in the USA and elsewhere, yet the number of prosecutions and convictions remain low, and the criminal justice system has limited capability or capacity to deal with the complexity of human trafficking cases (Farrell et al. 2012, 2014; Gallagher 2011). Studies have also noted that routine approaches of law enforcement may be inadequate to address human trafficking in its different forms. For example, police traditionally employ a reactive response to crime, whereas the identification of human trafficking requires a proactive approach because trafficked persons often do not self-identify as victims (Farrell and Pfeffer 2014). Furthermore, human trafficking is commonly delegated to specialized police units that are more likely to identify sex trafficking such as vice units. The routine strategies employed in these units (e.g., stings in brothels) may be less helpful to identify human trafficking operations that occur in the workplace (Farrell and Pfeffer 2014).

A criminal justice system approach has proven to be especially limiting in addressing corporate offending in the context of human trafficking. While the UN Convention against Transnational Organized Crime establishes corporate criminal liability, there has been a limited enforcement in domestic laws and regulations (Chap. 94, “Corporate Criminal Liability on Human Trafficking” by Schuman). Under domestic law, corporations often do not face criminal charges, with the exception of countries that have adopted legal provisions regarding the criminal liability of representatives, managers, or agents involved in human trafficking (e.g., the United Arab Emirates, see Mattar 2012). In the USA, scholars have started to call for an amendment of the TVPA to explicitly include corporate liability for trafficking involvement (Pierce 2010). A recently passed law in the USA, the Fight Online Sex Trafficking Act and Stop Enabling Sex Traffickers Act (FOSTA-SESTA), makes it possible to prosecute the corporations behind websites that facilitate sex trafficking by posting or sharing sexually explicit material such as online classifieds utilized for the recruitment of clients in the commercial sex industry. However, controversies about this law exist and include concerns about increased difficulties in investigating sex trafficking when online material that could otherwise be utilized as evidence may now disappear. In other countries like Australia, corporations are held liable for involvement in crime when “the offense is committed by an employee, agent or officer of a body corporation acting within the actual or apparent scope of his or her employment, or within his or her apparent authority” (Mattar 2012). However, even if corporate criminal liability is legally an option, its actual use may be limited due to
concerns about the potential adverse impacts of corporate criminal liability on businesses and trade relations (Mattar 2012). In response to the limitations of the criminal justice system to address human trafficking, the private sector is now being put forward as potential key to a more effective or at least complementary anti-trafficking response.

Private-Sector Responses

Various policy initiatives that involve the private sector are being developed. Many of these initiatives are better considered supplements to a criminal justice system response as they show how legitimate businesses are invaluable resources to law enforcement. For example, in the USA, Western Union participates in the Homeland Security Blue Campaign to conduct trainings on recognizing and reporting suspected human trafficking cases. The Blue Campaign is a collaborative effort of law enforcement, government, nongovernmental, and private organizations to raise public awareness about human trafficking (Western Union 2013). A variety of other industries have begun to train staff to identify sex or labor trafficking. For example, ECPAT-USA partnered with Marriott hotels to administer training in identifying and reporting human trafficking for all Marriott employees (Marriott International 2017). Similarly, Airline Ambassadors is a nongovernmental organization that provides training to airline personnel to identify and report individuals who may be at risk for human trafficking (Fortin 2017). A recent initiative called “Employers Against Sex Trafficking” (EAST), spearheaded by the Attorney-General’s office and Major of Massachusetts, Boston, engages businesses in prohibiting their employees to buy commercial sex during worktime with the aim to reduce opportunities for sex trafficking (Martin 2018).

In addition to such specific public-private partnerships, several innovative anti-trafficking efforts are being developed within the private sector. For example, in recognition of traffickers’ use of technology services and networks (Latonero 2011), companies have developed software and algorithms to identify traffickers or victims utilizing open-source online data (e.g., through the use of web crawlers) or corporate data (e.g., financial transactions) (see, e.g., Latonero 2011). The private sector can also be used to proactively regulate their own line of industry and corporations. Aaronson and Higham (2013) call for a mandated self-reporting mechanism to publicly reveal business efforts (or lack of efforts) to prevent human rights violations. Also Obokata (2005) advocates for the development of a system of accountability, suggesting that private firms should be held accountable for monitoring their application of codes of conduct. Such mandated reporting includes those being enforced under the California Transparency Act that went into effect in January 2012, which requires large-scale companies to report on strategies to identify and prevent human trafficking throughout the supply chain (Eckert 2013; Pickles and Zhu 2013; see also Chaps. 48, “Human Trafficking in Supply Chains and the Way Forward” by Lloyd and Chaps. 23, “The Spoiled Supply Chain of Child Labor” by Sadler Lawrence). Although not mandated and more on a global level, the United Nations
introduced Guidelines on Businesses and Human Rights that provide a framework for ethical corporate behavior that may also prevent human trafficking practices. Large companies like Microsoft and financial institutions like ABN Amro translated the guidelines in corporate codes of conduct (United Nations 2017).

Public Support for a Private-Sector Response

Scholars have observed a public pressure on the private sector to adopt socially responsible and legal ways of conducting business (Brammer et al. 2012; Lindh 2015; Schneiberg and Bartley 2008). Additionally, the private sector has begun to play a more important role in crime prevention and control generally as public-private partnerships on the community level are increasingly being designed to address local crime problems. Studies put forward a private-sector model as a more durable and less expensive alternative to criminal justice measures that press on governmental expenses, have sometimes problematic impacts on socially disadvantaged and minority communities, and have shown to be ineffective in addressing certain crimes (Clear 2011; Crawford and Evans 2017).

These general concerns for a role of the private sector to address crime and social problems may also indicate potential support for private-sector responses to human trafficking. A recent study explored public support for labor-market responses to human trafficking and found a willingness of the American public, especially women, to engage in ethical consumer behavior as a response to human trafficking. These initial insights into public support for private-sector responses to human trafficking underscore the need to further investigate the role of legitimate businesses in both facilitating and combating human trafficking.

Conclusions

As stated at the start of this chapter, the private sector has an important role in human trafficking. This chapter discusses three theoretical frameworks that can guide further empirical inquiries into the role of the private sector in human trafficking. An organized crime frame is helpful to understand crime infiltration in legitimate markets, whereas corporate crime frames shed more light on corporate offenders that initiate or coordinate crime. A network frame is a more comprehensive framework in that it addresses both witting and unwitting engagement in human trafficking operations due to the social and economic connections of traffickers.

A few aspects could not be discussed in this chapter as they require more empirical substantiation. This includes a detailed consideration of the role of the private sector across different economic systems such as informal and shadow economies and across economically distinct countries. In addition, it should be noted that the role of the private sector changes due to the advancement of sharing economies and less regulated services such as ride-sharing apps. These transforming economies may complicate the monitoring of labor, increase the pool
of labor-trafficked persons, or facilitate the transportation of sex-trafficked persons. While associated with opportunities for economic prosperity, a sharing economy has also been associated with regulatory loopholes and opportunities for exploitative practices (Sundararajan 2016). Hence, future research should also consider sex or labor trafficking in these emerging economies.

Additionally, more information is needed about the role of the private sector in different forms of human trafficking. Specifically, organ trafficking has received little attention in research on human trafficking with even less awareness of a facilitating role of the private sector. An early article that considered the organ trade as a possible form of corporate crime highlights the complicated nature of medical activities in the organ trade based on which a role of private hospitals can be expected (Foster 1997). The extent to which human trafficking for the purpose of organ removal depends on the private sector merits further attention.

This chapter sought to lay the ground for scholars and practitioners to conceptualize and analyze private-sector involvement in human trafficking and anti-trafficking responses. It follows from the theoretical approaches discussed in this chapter that scholars can no longer neglect the potential involvement of businesses in human trafficking. Likewise, businesses should be included in future anti-trafficking response efforts.

Abstract

Human trafficking as a complex phenomenon leaves no country unscathed as perpetrators continue to conjure up new schemes to subvert and circumvent efforts by the international counter-trafficking community. The challenges associated with effectively responding to the crime, whether through research or prevention, or taking a case from a crime scene to court involve multiple and interpenetrating social systems and human actors with different perspectives, skill sets, mandates, and objectives. Their interactions are numerous, interdependent, and causally indeterminate which give rise to environments characterized by volatility, uncertainty, complexity, and ambiguity (VUCA). This chapter will make a case for complex systems thinking, as a conceptual framework, to be interwoven in counter-trafficking activities by policymakers, researchers, activists, prosecutors, and police investigators (to name but a few) who are effectively engaged in a battle of wits against the human trafficking system that perpetrates the crime. The author’s policing and investigative exposure to and work in the field of counter-human trafficking over the past 16 years,

and his use of complex systems theory in a Ph.D. study, serves as the basis for this chapter. The chapter will contend that complex systems theory, and by extension complex systems thinking, has immense potential to alter our thinking about micro-level strategies and can explain how foundational interactions and interconnectedness give rise to emergent properties on a macro-level, which are not predictable from the parts alone. It is recommended that reductionist responses and “fixes that fail” are set aside in favor of a whole approach to human trafficking combating efforts that are better equipped to embrace complexity.

Keywords

Systems theory · Complexity theory · Complex systems theory · Human trafficking response mechanisms · Criminal investigation · Prosecution

Introduction

As a truly global problem, human trafficking is by no means a recent phenomenon (Allais 2013; Kabance 2014; Morawska 2007) and takes place in and between many countries throughout the world (Franco 2015). Except for Antarctica, it has affected every continent, and it continues to exist throughout the history of humankind (Kabance 2014). A range of disciplines and perspectives that intersect and engage with the issue of human trafficking exist (Laczko 2007; Lee 2007; Lopez and Minassians 2017) which continue to explore, deliberate, hypothesize, contend, and antagonize about issues of scope, response mechanisms, and policy development. Disciplines and perspectives include fields such as criminology, politics, law, human rights, sociology, gender, and public health with the problem interpreted as, among other things, human trafficking as illegal migration, a threat to national sovereignty and security, slavery, transnational organized crime, a labor issue, a violation of human rights, or a combination of the aforementioned issues (Lee 2007).
